
Consider such a pair of nonempty words u and v with **minimum** $\ell(u)$. The minimality of $\ell(u)$ shows that

$$\left(\begin{array}{c} \text{if } u' \text{ and } v' \text{ are nonempty words such that } w = u'v' \text{ and not } v'u' > u'v', \\ \text{then } \ell(u') \geq \ell(u) \end{array} \right). \tag{13.146.14}$$

We have $vu \geq uv$ (according to Assertion $\mathcal{D}'$) but not $vu > uv$. Thus, $vu = uv$. Therefore, Proposition 6.1.4 yields that there exist a $t \in \mathfrak{A}^*$ and two nonnegative integers n and m such that $u = t^n$ and $v = t^m$. Consider this t and these n and m. We have $n \neq 0$ (since $t^n = u$ is nonempty) and $m \neq 0$ (since $t^m = v$ is nonempty), and the word t is nonempty (since $t^n = u$ is nonempty). Moreover, we have $n = 1$ [1015]. Hence, $t^n = t^1 = t$, so that $u = t^n = t$ and $w = \underbrace{u}_{=t}\underbrace{v}_{=t^m} = tt^m = t^{m+1}$. We shall now prove that the word t is Lyndon.

Assume the contrary. Then, t is not Lyndon. Hence, (13.146.12) (applied to $h = t$) shows that there exist nonempty words p and q such that $t = pq$ and not $qp > pq$. Consider these p and q. Since q is nonempty, we have $\ell(q) > 0$, so that $\ell\left(\underbrace{u}_{=t=pq}\right) = \ell(pq) = \ell(p) + \underbrace{\ell(q)}_{>0} > \ell(p)$.

We have $w = \underbrace{u}_{=t=pq} v = pqv$, and the words p and qv are nonempty[1016]. Now, using (13.146.14), it is easy to see that $qvp > pqv$ [1017].

Notice that $q(pq)^i = (qp)^i q$ for every $i \in \mathbb{N}$ [1018]. Applied to $i = m$, this yields $q(pq)^m = (qp)^m q$.

But $v = t^m$. Since $t = pq$, this rewrites as $v = (pq)^m$. Hence,

$$q \underbrace{v}_{=(pq)^m} p = \underbrace{q(pq)^m}_{=(qp)^m q} p = (qp)^m qp = (qp)^m (qp) = (qp)^{m+1},$$

so that $(qp)^{m+1} = qvp > pqv$. But

$$(pq)^{m+1} = (pq)\left(\underbrace{pq}_{=t}\right)^m = (pq)\underbrace{t^m}_{=v} = (pq)v = pqv < (qp)^{m+1}$$

[1015] *Proof.* Assume the contrary. Hence, $n \neq 1$. Combined with $n \neq 0$, this leads to $n \geq 2$. As a consequence, $u = t^n$ can be rewritten as $u = tt^{n-1}$. The word t^{n-1+m} is nonempty (since t is nonempty and since $\underbrace{n}_{\geq 2} - 1 + \underbrace{m}_{\geq 0} \geq 2 - 1 + 0 = 1$). Now, $w = \underbrace{u}_{=tt^{n-1}}\underbrace{v}_{=t^m} = tt^{n-1}t^m = tt^{n-1+m}$. Also, $t^{n-1+m}t = t^{n-1+m+1} = tt^{n-1+m}$. Thus, we do not have $t^{n-1+m}t > tt^{n-1+m}$. Hence, (13.146.14) (applied to $u' = t$ and $v' = t^{n-1+m}$) yields $\ell(t) \geq \ell(u)$ (since t and t^{n-1+m} are nonempty). Since $u = t^n$, this rewrites as $\ell(t) \geq \ell(t^n) = \underbrace{n}_{\geq 2}\ell(t) \geq 2\ell(t)$, whence $\ell(t) = 0$, which contradicts the fact that t is nonempty. This contradiction shows that our assumption was wrong, qed.

[1016] For qv, this follows from the nonemptiness of q.

[1017] *Proof.* Assume the contrary. Then, we do not have $qvp > pqv$. We can thus apply (13.146.14) to $u' = p$ and $v' = qv$. As a result, we obtain $\ell(p) \geq \ell(u)$. This contradicts $\ell(u) > \ell(p)$. This contradiction shows that our assumption was wrong, qed.

[1018] *Proof.* We shall prove the equality $q(pq)^i = (qp)^i q$ by induction over i:

Induction base: We have $q\underbrace{(pq)^0}_{=\varnothing} = q\varnothing = q = \underbrace{\varnothing}_{=(qp)^0} q = (qp)^0 q$. In other words, the equality $q(pq)^i = (qp)^i q$ holds for $i = 0$. This completes the induction base.

Induction step: Let $I \in \mathbb{N}$ be such that the equality $q(pq)^i = (qp)^i q$ holds for $i = I$. We need to show that the equality $q(pq)^i = (qp)^i q$ also holds for $i = I + 1$.

We have $q(pq)^I = (qp)^I q$ (since the equality $q(pq)^i = (qp)^i q$ holds for $i = I$). Thus,

$$q \underbrace{(pq)^{I+1}}_{=(pq)^I(pq)} = \underbrace{q(pq)^I}_{=(qp)^I q}(pq) = (qp)^I \underbrace{q(pq)}_{=(qp)q} = \underbrace{(qp)^I(qp)}_{=(qp)^{I+1}} q = (qp)^{I+1} q.$$

In other words, the equality $q(pq)^i = (qp)^i q$ holds for $i = I + 1$. This completes the induction step. The induction proof of the equality $q(pq)^i = (qp)^i q$ is thus complete.

(since $(qp)^{m+1} > pqv$). From this, it is easy to see that $pq < qp$ [1019], so that $qp > pq$. This contradicts the fact that we do not have $qp > pq$. This contradiction shows that our assumption (that t is not Lyndon) was wrong. Hence, t is Lyndon. Thus, w is a power of a Lyndon word (since $w = t^{m+1}$ is a power of t). Thus, Assertion $\mathcal{A}'$ is satisfied, so we have proven the implication $\mathcal{D}' \Longrightarrow \mathcal{A}'$.

Now we have proven both implications $\mathcal{A}' \Longrightarrow \mathcal{D}'$ and $\mathcal{D}' \Longrightarrow \mathcal{A}'$. Therefore, the equivalence $\mathcal{A}' \Longleftrightarrow \mathcal{D}'$ follows. Thus, Exercise 6.1.32(a) is solved in the partial-order case.

Solution to Exercise 6.1.32(b) in the partial-order setting. Consider the letter m and the alphabet $\mathfrak{A} \cup \{m\}$ defined in Assertion $\mathcal{F}''$. We notice that the lexicographic order on $\mathfrak{A}^*$ is the restriction of the lexicographic order on $(\mathfrak{A} \cup \{m\})^*$ to $\mathfrak{A}^*$. Therefore, when we have two words p and q in $\mathfrak{A}^*$, statements like "$p < q$" do not depend on whether we are regarding p and q as elements of $\mathfrak{A}^*$ or as elements of $(\mathfrak{A} \cup \{m\})^*$. It is easy to see that the one-letter word m satisfies

$$m > p \qquad \text{for every } p \in \mathfrak{A}^*. \tag{13.146.15}$$

[1020]

The implications $\mathcal{B}' \Longrightarrow \mathcal{E}'$, $\mathcal{C}' \Longrightarrow \mathcal{E}'$, $\mathcal{G}' \Longrightarrow \mathcal{H}'$, $\mathcal{F}'' \Longrightarrow \mathcal{B}'$, $\mathcal{F}'' \Longrightarrow \mathcal{C}'$ and $\mathcal{F}' \Longrightarrow \mathcal{B}'$ can be proven in the same way as they were proven in the total-order setting. We shall now prove some further implications.

Proof of the implication $\mathcal{E}' \Longrightarrow \mathcal{F}''$: Assume that Assertion $\mathcal{E}'$ holds.

Assume (for the sake of contradiction) that the word $wm \in (\mathfrak{A} \cup \{m\})^*$ is not a Lyndon word. Clearly, this word wm is nonempty. Thus, (13.146.13) (applied to $h = wm$) shows that there exist nonempty words u and v in $(\mathfrak{A} \cup \{m\})^*$ such that $wm = uv$ and not $v > u$. Denote these two nonempty words u and v by u and v'. Then, u and v' are nonempty words in $(\mathfrak{A} \cup \{m\})^*$ such that $wm = uv'$ and not $v' > u$.

The word v' is a proper suffix of wm (since $wm = uv'$ and since w is nonempty). Hence, v' is a nonempty suffix of wm. Thus, we must be in one of the following two cases (depending on whether this suffix begins before the suffix m of wm begins or afterwards):

Case 1: The word v' is a nonempty suffix of m. (Note that $v' = m$ is allowed.)

Case 2: The word v' has the form vm where v is a nonempty proper suffix of w.

Let us consider Case 1 first. In this case, the word v' is a nonempty suffix of m. Since the only nonempty suffix of m is m itself (because m is a one-letter word), this yields $v' = m$. Now, $wm = u \underbrace{v'}_{=m} = um$. Cancelling m from this equality, we obtain $w = u$. But $v' = m > w$ (by (13.146.15), applied to $p = w$), thus $v' > w = u$. This contradicts the fact that we don't have $v' > u$. Thus, we have obtained a contradiction in Case 1.

Let us now consider Case 2. In this case, the word v' has the form vm where v is a nonempty proper suffix of w. Consider this v. We have $wm = u \underbrace{v'}_{=vm} = uvm$. By cancelling m from this equality, we obtain $w = uv$. Thus, u and v are subwords of w, and therefore belong to $\mathfrak{A}^*$ (since $w \in \mathfrak{A}^*$). Moreover, u and v are nonempty. Hence, Assertion $\mathcal{E}'$ yields that either we have $v \geq u$ or the word v is a prefix of w. Since we cannot have $v \geq u$ (because if we had $v \geq u$, then we would have $v' = vm > v \geq u$, which would contradict the fact that we don't have $v' > u$), we therefore must have that v is a prefix of w. In other words, there exists a $q \in \mathfrak{A}^*$ such that $w = vq$. Consider this q. We have $m > q$ (by (13.146.15), applied to $p = q$). Thus, $q \leq m$. Hence, Proposition 6.1.2(b) (applied to $\mathfrak{A} \cup \{m\}$, v, q and m instead of $\mathfrak{A}$, a, c and d) yields $vq \leq vm$. Therefore, $vm \geq vq = w$ (since $w = vq$), so that $v' = vm \geq w = uv > u$ (since v is nonempty). This contradicts the fact that we don't have $v' > u$. Thus, we have found a contradiction in Case 2.

We have therefore obtained a contradiction in each of the two Cases 1 and 2. Since these two Cases cover all possibilities, this shows that we always get a contradiction. Hence, our assumption (that the word $wm \in (\mathfrak{A} \cup \{m\})^*$ is not a Lyndon word) was false. Hence, the word $wm \in (\mathfrak{A} \cup \{m\})^*$ is a Lyndon word. That is, Assertion $\mathcal{F}''$ holds. Hence, we have proven the implication $\mathcal{E}' \Longrightarrow \mathcal{F}''$.

Proof of the implication $\mathcal{B}' \Longrightarrow \mathcal{G}'$: Assume that Assertion $\mathcal{B}'$ holds.

[1019] *Proof.* Assume the contrary. Thus, we don't have $pq < qp$. But $(pq)(pq)^m = (pq)^{m+1} < (qp)^{m+1} = (qp)(qp)^{m+1}$ and $\ell(pq) = \ell(p) + \ell(q) = \ell(q) + \ell(p) = \ell(qp)$. Hence, Proposition 6.1.2(f) (applied to $a = pq$, $b = (pq)^m$, $c = qp$ and $d = (qp)^m$) yields $pq \leq qp$. Thus, $pq = qp$ (since we don't have $pq < qp$). Taking both sides of this equality to the $(m+1)$-th power, we obtain $(pq)^{m+1} = (qp)^{m+1}$, which contradicts $(pq)^{m+1} < (qp)^{m+1}$. This contradiction proves that our assumption was wrong, qed.

[1020] This can be proven in the same way as it was proven in the total-order setting.

Let s be the longest suffix v of w which does not satisfy $v \geq w$. (This is well-defined, because there exists a suffix v of w which does not satisfy $v \geq w$ – namely, the empty word.) So we know that s is a suffix v of w which does not satisfy $v \geq w$. In other words, s is a suffix of w and does not satisfy $s \geq w$. Hence, $s \neq w$ (because otherwise, we would have $s = w$ and thus $s \geq w$; but this would contradict the fact that s does not satisfy $s \geq w$). Thus, s is a proper suffix of w (because s is a suffix of w and satisfies $s \neq w$). Hence, there exists a nonempty word $h \in \mathfrak{A}^*$ satisfying $w = hs$. Consider this h. Using Assertion $\mathcal{B}'$, it is easy to see that s is a prefix of w [1021]. In other words, there exists a $g \in \mathfrak{A}^*$ such that $w = sg$. Consider this g. We have $g \neq \varnothing$ (because otherwise, we would have $g = \varnothing$ and thus $w = s \underbrace{g}_{=\varnothing} = s \neq w$, which would be absurd). In other words, the word g is nonempty. Thus, $s < sg = w$.

We know that s is the longest suffix v of w which does not satisfy $v \geq w$. Hence,

$$(\text{if } v \text{ is a suffix of } w \text{ which does not satisfy } v \geq w, \text{ then } \ell(v) \leq \ell(s)). \tag{13.146.16}$$

There exists a nonnegative integer m such that h^m is a prefix of s (for example, the nonnegative integer $m = 0$). Consider the **maximal** such integer m [1022]. Then, h^m is a prefix of s, but h^{m+1} is not a prefix of s. Since h^m is a prefix of s, there exists a word $q \in \mathfrak{A}^*$ such that $s = h^m q$. Consider this q. Clearly, $w = h \underbrace{s}_{=h^m q} = \underbrace{hh^m}_{=h^{m+1}} q = \underbrace{h^{m+1}}_{=h^m h} q = h^m hq$. Hence, $h^m hq = w = \underbrace{s}_{=h^m q} g = h^m qg$. Cancelling h^m from this equality, we obtain $hq = qg$. It is now easy to see that we don't have $h \leq q$ [1023]. But $h\varnothing = h \leq hq = qg$. Thus, Proposition 6.1.2(e) (applied to h, $\varnothing$, q and g instead of a, b, c and d) yields that either we have $h \leq q$ or the word q is a prefix of h. Thus, the word q is a prefix of h (since we don't have $h \leq q$).

Next, we shall prove that the word h is Lyndon.

In fact, assume the contrary. Then, h is not Lyndon. Hence, (13.146.11) shows that there exist nonempty words u and v such that $h = uv$ and not $vu > uv$. Consider these u and v. Since $w = \underbrace{h}_{=uv} s = uvs = u(vs)$, it is clear that the word vs is a suffix of w. If this suffix vs would not satisfy $vs \geq w$, then we could therefore obtain $\ell(vs) \leq \ell(s)$ (by (13.146.16), applied to vs instead of v), which would contradict $\ell(vs) = \underbrace{\ell(v)}_{\substack{>0 \\ (\text{since } v \text{ is nonempty})}} + \ell(s) > \ell(s)$. Thus, the suffix vs must satisfy $vs \geq w$. We thus have $vs \geq w = hs \geq h = uv$, so that $uv \leq vs$.

Recall that $s < w$. Hence, $vs \leq vw$ (by Proposition 6.1.2(b), applied to v, s and w instead of a, c and d). Now, $uv\varnothing = uv \leq vs \leq v \underbrace{w}_{=hs} = v \underbrace{h}_{=uv} s = vuvs$ and $\ell(uv) = \ell(u) + \ell(v) = \ell(v) + \ell(u) = \ell(vu) \leq \ell(vu)$. Hence, Proposition 6.1.2(f) (applied to uv, $\varnothing$, vu and vs instead of a, b, c and d) yields that $uv \leq vu$. In other words, $vu \geq uv$. Since we don't have $vu > uv$, we therefore must have $vu = uv$. Thus, the elements u and v of the monoid $\mathfrak{A}^*$ commute. Thus, the submonoid of $\mathfrak{A}^*$ generated by u and v is commutative. Since $h = uv$, the element h lies in this submonoid, and therefore the element h^m lies in it as well. Thus, h^m commutes

[1021] *Proof.* Assume the contrary. Thus, s is not a prefix of w. Hence, s is nonempty. Therefore, Assertion $\mathcal{B}'$ (applied to $u = h$ and $v = s$) yields that either we have $s \geq w$ or the word s is a prefix of w. Since s is not a prefix of w, we must thus have $s \geq w$. But this contradicts the fact that s does not satisfy $s \geq w$. This contradiction shows that our assumption was wrong, qed.

[1022] This is well-defined, because of the following reason:

We have $\ell(h) \geq 1$ (since the word h is nonempty). Thus, for every $m \in \mathbb{N}$ satisfying $m > \ell(s)$, we have $\ell(h^m) = m \underbrace{\ell(h)}_{\geq 1} \geq m > \ell(s)$. In other words, for every $m \in \mathbb{N}$ satisfying $m > \ell(s)$, the word h^m is longer than s. Hence, for every $m \in \mathbb{N}$ satisfying $m > \ell(s)$, the word h^m cannot be a prefix of s. Thus, for every sufficiently high $m \in \mathbb{N}$, the word h^m cannot be a prefix of s.

We thus know the following:

- There exists a nonnegative integer m such that h^m is a prefix of s.
- For every sufficiently high $m \in \mathbb{N}$, the word h^m cannot be a prefix of s.

Consequently, there exists a **maximal** nonnegative integer m such that h^m is a prefix of s, qed.

[1023] *Proof.* Assume the contrary. Then, $h \leq q$. Hence, $h \leq q \leq qg = hq$ (since $hq = qg$). Therefore, Proposition 6.1.2(g) (applied to h, q and q instead of a, b and c) yields that h is a prefix of q. In other words, there exists a word $r \in \mathfrak{A}^*$ such that $q = hr$. Consider this r. Now, $s = h^m \underbrace{q}_{=hr} = \underbrace{h^m h}_{=h^{m+1}} r = h^{m+1} r$, so that h^{m+1} is a prefix of s. This contradicts the fact that h^{m+1} is not a prefix of s. This contradiction proves that our assumption was wrong, qed.

with v (since this submonoid is commutative), i.e., we have $vh^m = h^m v$. Thus, $v \underbrace{s}_{=h^m q} = \underbrace{vh^m}_{=h^m v} q = h^m vq$. Thus, $h^m vq = vs \geq w = h \underbrace{s}_{=h^m q} = \underbrace{hh^m}_{=h^{m+1}=h^m h} q = h^m hq$, so that $h^m hq \leq h^m vq$. Hence, Proposition 6.1.2(c) (applied to h^m, hq and vq instead of a, c and d) yields $hq \leq vq$. But since q is a prefix of h, there exists a word $z \in \mathfrak{A}^*$ such that $h = qz$. Consider this z. We have

$$v \underbrace{qz}_{=h=uv} = \underbrace{vu}_{=uv=h} v = hv \leq h \underbrace{vu}_{=uv=h=qz} \qquad \text{(since } hv \text{ is a prefix of } hvu\text{)}$$
$$= hqz.$$

Also, $\ell\left(\underbrace{h}_{=uv} q\right) = \ell(uvq) = \ell(u(vq)) = \underbrace{\ell(u)}_{\substack{>0 \\ \text{(since } u \text{ is nonempty)}}} + \ell(vq) > \ell(vq)$, so that $\ell(vq) \leq \ell(hq)$. Hence, Proposition 6.1.2(f) (applied to vq, z, hq and z instead of a, b, c and d) yields $vq \leq hq$. Combined with $hq \leq vq$, this yields $vq = hq$. Hence, $\ell\left(\underbrace{vq}_{=hq}\right) = \ell(hq) > \ell(vq)$, which is absurd. This contradiction proves that our assumption is wrong. Thus, we have shown that the word h is Lyndon.

We now know that $h \in \mathfrak{A}^*$ is a Lyndon word, $m+1$ is a positive integer, and q is a prefix of h, and we have $w = h^{m+1}q$. Hence, there exists a Lyndon word $t \in \mathfrak{A}^*$, a positive integer ℓ and a prefix p of t (possibly empty) such that $w = t^\ell p$ (namely, $t = h$, $\ell = m+1$ and $p = q$). In other words, Assertion $\mathcal{G}'$ holds. This proves the implication $\mathcal{B}' \Longrightarrow \mathcal{G}'$.

Furthermore, the implication $\mathcal{F}' \Longrightarrow \mathcal{B}'$ holds. (In fact, it can be proven in the same way as it was proven in the total-order setting.)

Proof of the implication $\mathcal{H}' \Longrightarrow \mathcal{B}'$: Assume that Assertion $\mathcal{H}'$ holds. In other words, there exists a Lyndon word $t \in \mathfrak{A}^*$, a nonnegative integer ℓ and a prefix p of t (possibly empty) such that $w = t^\ell p$. Consider this t, this ℓ and this p.

We are going to prove that for every $m \in \mathbb{N}$,

$$\text{(13.146.17)} \qquad \left(\text{every suffix } s \text{ of } t^m p \text{ satisfies either } s \geq t^m p \text{ or } \left(\text{the word } s \text{ is a prefix of } t^m p\right)\right).$$

Proof of (13.146.17): We will prove (13.146.17) by induction over m:

Induction base: Using the implication $\mathcal{F}' \Longrightarrow \mathcal{B}'$, it is easy to see that (13.146.17) holds for $m = 0$ [1024]. This completes the induction base.

Induction step: Let M be a positive integer. Assume that (13.146.17) is proven for $m = M-1$. We will now show that (13.146.17) holds for $m = M$.

[1024] *Proof.* Assume that $m = 0$. Then, $t^m p = \underbrace{t^0}_{=\varnothing} p = \varnothing p = p$.

Let s be a suffix of $t^m p$. Then, s is a suffix of $t^m p = p$. In other words, there exists a word $g \in \mathfrak{A}^*$ satisfying $p = gs$. Consider this g.

We are going to prove that either $s \geq t^m p$ or (the word s is a prefix of $t^m p$). If the word s is empty, then this is obvious (because if the word s is empty, then the word s is a prefix of $t^m p$). Hence, we WLOG assume that the word s is nonempty. If the word g is empty, then it is also clear that either $s \geq t^m p$ or (the word s is a prefix of $t^m p$) (because if the word g is empty, then $g = \varnothing$ and thus $t^m p = p = \underbrace{g}_{=\varnothing} s = s$, so that the word s is a prefix of $t^m p$). Hence, we WLOG assume that the word g is nonempty.

But the word p is a prefix of a Lyndon word in $\mathfrak{A}^*$ (since p is a prefix of t, and since t is a Lyndon word in $\mathfrak{A}^*$). In other words, Assertion $\mathcal{F}'$ with w replaced by p is satisfied. Hence, Assertion $\mathcal{B}'$ with w replaced by p is satisfied as well (since we have already proven the implication $\mathcal{F}' \Longrightarrow \mathcal{B}'$). In other words,

$$\text{(13.146.18)} \qquad \left(\begin{array}{c}\text{if } u \text{ and } v \text{ are nonempty words satisfying } p = uv \text{, then} \\ \text{either we have } v \geq p \text{ or the word } v \text{ is a prefix of } p\end{array}\right).$$

Since the words g and s are nonempty, we can apply (13.146.18) to $u = g$ and $v = s$. As a result, we obtain that either we have $s \geq p$ or the word s is a prefix of p. In other words, either $s \geq p$ or (the word s is a prefix of p). In other words, either $s \geq t^m p$ or (the word s is a prefix of $t^m p$) (since $t^m p = p$). This proves (13.146.17).

Let r denote the word $t^{M-1}p$. It is easy to see that r is a prefix of $t^M p$ [1025]. In other words, there exists a word $g \in \mathfrak{A}^*$ such that $t^M p = rg$. Consider this g.

Let s be a suffix of $t^M p$. We shall show that either $s \geq t^M p$ or $\left(\text{the word } s \text{ is a prefix of } t^M p\right)$.

In order to prove this, let us assume the contrary (for the sake of contradiction). Then, neither $s \geq t^M p$ nor $\left(\text{the word } s \text{ is a prefix of } t^M p\right)$. In other words, we don't have $s \geq t^M p$, and the word s is not a prefix of $t^M p$. If the word s was a prefix of r, then the word s would be a prefix of $t^M p$ (since r is a prefix of $t^M p$), which would contradict the fact that the word s is not a prefix of $t^M p$. Hence, the word s cannot be a prefix of r. In other words, the word s cannot be a prefix of $t^{M-1}p$ (since $r = t^{M-1}p$).

We don't have $s \geq t^M p$. Since $s = s\varnothing$ and $t^M p = rg$, this rewrites as follows: We don't have $s\varnothing \geq rg$. In other words, we don't have $rg \leq s\varnothing$.

The word s is a suffix of $\underbrace{t^M}_{=tt^{M-1}} p = t \underbrace{t^{M-1}p}_{=r} = tr$. Therefore, we must be in one of the following two cases (depending on whether this suffix begins before the suffix r of tr begins or afterwards):

Case 1: The word s is a suffix of r. (Note that $s = r$ is allowed.)

Case 2: The word s has the form $s'r$ where s' is a nonempty suffix of t.

Let us consider Case 1 first. In this case, the word s is a suffix of r. In other words, the word s is a suffix of $t^{M-1}p$ (since $r = t^{M-1}p$). Hence, (13.146.17) (applied to $m = M-1$) yields that either $s \geq t^{M-1}p$ or $\left(\text{the word } s \text{ is a prefix of } t^{M-1}p\right)$ (since (13.146.17) holds for $m = M-1$). Since the word s cannot be a prefix of $t^{M-1}p$, we thus must have $s \geq t^{M-1}p$. Thus, $t^{M-1}p \leq s$, so that $r = t^{M-1}p \leq s$. Therefore, Proposition 6.1.2(d) (applied to r, g, s and $\varnothing$ instead of a, b, c and d) yields that either we have $rg \leq s\varnothing$ or the word r is a prefix of s. Thus, the word r is a prefix of s (since we don't have $rg \leq s\varnothing$). But $\ell(r) \geq \ell(s)$ (since s is a suffix of r). Hence, r is a prefix of s which is at least as long as s itself. Consequently, $r = s$. Hence, $s = r$, so that s is a prefix of $s = r$. This contradicts the fact that the word s cannot be a prefix of r. Thus, we have found a contradiction in Case 1.

Let us now consider Case 2. In this case, the word s has the form $s'r$ where s' is a nonempty suffix of t. Consider this s'. Corollary 6.1.15 (applied to t and s' instead of w and v) yields $s' \geq t$. That is, $t \leq s'$. But s' is a suffix of t, so that $\ell(s') \leq \ell(t)$. Hence, $\ell(t) \geq \ell(s')$. Thus, Proposition 6.1.2(j) (applied to t, s' and r instead of a, b and c) yields $tr \leq s'r$. Hence, $s'r \geq tr$, so that $s = s'r \geq tr = t^M p$. This contradicts the fact that we don't have $s \geq t^M p$. Thus, we have found a contradiction in Case 2.

We have thus obtained a contradiction in each of the two Cases 1 and 2. Since these two Cases cover all possibilities, this shows that we always get a contradiction. This completes the proof that either $s \geq t^M p$ or $\left(\text{the word } s \text{ is a prefix of } t^M p\right)$.

Now, forget that we fixed s. We thus have shown that every suffix s of $t^M p$ satisfies either $s \geq t^M p$ or $\left(\text{the word } s \text{ is a prefix of } t^M p\right)$. In other words, (13.146.17) holds for $m = M$. This completes the induction step, and thus (13.146.17) is proven by induction.

Now, let u and v be nonempty words satisfying $w = uv$. Then, v is a suffix of $w = t^\ell p$. Hence, (13.146.17) (applied to $m = \ell$ and $s = v$) yields that either $v \geq t^\ell p$ or $\left(\text{the word } v \text{ is a prefix of } t^\ell p\right)$. In other words, either $v \geq w$ or (the word v is a prefix of w) (since $w = t^\ell p$). In other words, either we have $v \geq w$ or the word v is a prefix of w.

Now, forget that we fixed u and v. We thus have shown that if u and v are nonempty words satisfying $w = uv$, then either we have $v \geq w$ or the word v is a prefix of w. In other words, Assertion $\mathcal{B}'$ holds. Thus, the implication $\mathcal{H}' \Longrightarrow \mathcal{B}'$ is proven.

We have thus proven the implications $\mathcal{B}' \Longrightarrow \mathcal{E}'$, $\mathcal{C}' \Longrightarrow \mathcal{E}'$, $\mathcal{G}' \Longrightarrow \mathcal{H}'$, $\mathcal{E}' \Longrightarrow \mathcal{F}''$, $\mathcal{F}'' \Longrightarrow \mathcal{B}'$, $\mathcal{F}' \Longrightarrow \mathcal{C}'$, $\mathcal{B}' \Longrightarrow \mathcal{G}'$ and $\mathcal{H}' \Longrightarrow \mathcal{B}'$. Combined, these yield the equivalence $\mathcal{B}' \Longleftrightarrow \mathcal{C}' \Longleftrightarrow \mathcal{E}' \Longleftrightarrow \mathcal{F}'' \Longleftrightarrow \mathcal{G}' \Longleftrightarrow \mathcal{H}'$. This solves Exercise 6.1.32(b) in the partial-order setting.

Solution to Exercise 6.1.32(c) in the partial-order setting. The implication $\mathcal{F}' \Longrightarrow \mathcal{B}'$ has already been proven in our solution of Exercise 6.1.32(b). Hence, Exercise 6.1.32(c) is solved in the partial-order setting.

Solution to Exercise 6.1.32(d) in the partial-order setting. The solution of Exercise 6.1.32(d) in the partial-order setting proceeds precisely as in the total-order setting.

[1025] *Proof.* There exists a word $q \in \mathfrak{A}^*$ such that $t = pq$ (since p is a prefix of t). Consider this q. We have $\underbrace{t^M}_{=t^{M-1}t} p = t^{M-1} \underbrace{t}_{=pq} p = \underbrace{t^{M-1}p}_{=r} qp = rqp = r(qp)$. Hence, r is a prefix of $t^M p$, qed.

Solution to Exercise 6.1.32(e) in the partial-order setting. The solution of Exercise 6.1.32(e) in the partial-order setting proceeds precisely as in the total-order setting.

Solution to Exercise 6.1.32(f) in the partial-order setting. Assume that there exists a letter $\mu \in \mathfrak{A}$ such that ($\mu > a$ for some letter a of w). Consider this μ. We need to prove that the equivalence $\mathcal{F}' \Longleftrightarrow \mathcal{F}''$ holds.

Combining the implication $\mathcal{F}' \Longrightarrow \mathcal{B}'$ (which has already been proven) and the implication $\mathcal{B}' \Longrightarrow \mathcal{F}''$ (which follows from the equivalence $\mathcal{B}' \Longleftrightarrow \mathcal{C}' \Longleftrightarrow \mathcal{E}' \Longleftrightarrow \mathcal{F}'' \Longleftrightarrow \mathcal{G}' \Longleftrightarrow \mathcal{H}'$ proven above), we obtain the implication $\mathcal{F}' \Longrightarrow \mathcal{F}''$. Thus, in order to prove the equivalence $\mathcal{F}' \Longleftrightarrow \mathcal{F}''$, it is enough to verify the implication $\mathcal{F}'' \Longrightarrow \mathcal{F}'$. Let us do this now.

Assume that Assertion $\mathcal{F}''$ holds. Due to the implication $\mathcal{F}'' \Longrightarrow \mathcal{G}'$ (which follows from the equivalence $\mathcal{B}' \Longleftrightarrow \mathcal{C}' \Longleftrightarrow \mathcal{E}' \Longleftrightarrow \mathcal{F}'' \Longleftrightarrow \mathcal{G}' \Longleftrightarrow \mathcal{H}'$ proven above), this yields that Assertion $\mathcal{G}'$ holds. In other words, there exists a Lyndon word $t \in \mathfrak{A}^*$, a positive integer ℓ and a prefix p of t (possibly empty) such that $w = t^\ell p$. Consider these t, ℓ and p.

We shall first prove that

$$\text{there exists a letter } z \in \mathfrak{A} \text{ such that } z > t. \tag{13.146.19}$$

Proof of (13.146.19): The word t is Lyndon and thus nonempty. Hence, $\ell(t) \geq 1$. We thus are in one of the following two cases:

Case 1: We have $\ell(t) = 1$.

Case 2: We have $\ell(t) > 1$.

Let us consider Case 1 first. In this case, we have $\ell(t) = 1$. Thus, t is a one-letter word. In other words, $t = b$ for some letter b. Let us consider this b.

Recall that $\mu > a$ for some letter a of w. Consider this letter a.

The word $t^\ell p$ is a prefix of $t^\ell t$ (since p is a prefix of t). In other words, the word w is a prefix of $t^{\ell+1}$ (since $w = t^\ell p$ and $t^{\ell+1} = t^\ell t$). Hence, each letter of w is a letter of $t^{\ell+1}$. Since each letter of $t^{\ell+1}$ is a letter of t, this shows that each letter of w is a letter of t. Applying this to the letter a, we conclude that a is a letter of t (since a is a letter of w).

Now, both a and b are letters of t. Since the word t has only one letter (because $\ell(t) = 1$), this yields that $a = b$. Hence, $\mu > a = b = t$ (since $t = b$). Hence, there exists a letter $z \in \mathfrak{A}$ such that $z > t$ (namely, $z = \mu$). Thus, (13.146.19) is proven in Case 1.

Let us now consider Case 2. In this case, we have $\ell(t) > 1$. Let g be the last letter of the word t (this is well-defined since t is nonempty). Then, the one-letter word g is a suffix of the word t, and therefore there exists a word $t' \in \mathfrak{A}^*$ such that $t = t'g$. Consider this t'. Since g is a one-letter word, we have $\ell(g) = 1$. Thus, $\ell\left(\underbrace{t}_{=t'g}\right) = \ell(t') + \underbrace{\ell(g)}_{=1} = \ell(t') + 1$, so that $\ell(t') = \underbrace{\ell(t)}_{>1} - 1 > 1 - 1 = 0$. Hence, the word t' is nonempty. Thus, g is a proper suffix of t (since $t = t'g$). Also, g is nonempty (since $\ell(g) = 1$). But recall that the word t is Lyndon. By the definition of a Lyndon word, this yields that every nonempty proper suffix v of t satisfies $v > t$. Applying this to $v = g$, we obtain $g > t$. Thus, there exists a letter $z \in \mathfrak{A}$ such that $z > t$ (namely, $z = g$). Thus, (13.146.19) is proven in Case 2.

We have thus proven (13.146.19) in each of the two Cases 1 and 2. Since these two Cases cover all possibilities, this yields that (13.146.19) always holds.

Now, (13.146.19) shows that there exists a letter $z \in \mathfrak{A}$ such that $z > t$. Consider this letter z. We have $z > t$, thus $t < z$, hence $t \leq z$. The one-letter word z is Lyndon (since every one-letter word is Lyndon). Thus, $\underbrace{t, t, \ldots, t}_{\ell+1 \text{ times } t}, z$ are $\ell + 2$ Lyndon words (since both t and z are Lyndon) satisfying $t \leq t \leq \cdots \leq t \leq z$ (since $t \leq z$) and $t < z$. Hence, Exercise 6.1.23 (applied to $\ell + 2$ and $\left(\underbrace{t, t, \ldots, t}_{\ell+1 \text{ times } t}, z\right)$ instead of n and $(w_1, w_2, \ldots, w_n)$) yields that $\underbrace{tt\cdots t}_{\ell+1 \text{ times } t} z$ is a Lyndon word. In other words, $t^{\ell+1}z$ is a Lyndon word (since $\underbrace{tt\cdots t}_{\ell+1 \text{ times } t} = t^{\ell+1}$).

But p is a prefix of t. In other words, there exists a $q \in \mathfrak{A}^*$ such that $t = pq$. Consider this q. We then have $\underbrace{t^{\ell+1}}_{=t^\ell t} z = t^\ell \underbrace{t}_{=pq} z = \underbrace{t^\ell p}_{=w} qz = wqz = w(qz)$. Hence, w is a prefix of the word $t^{\ell+1}z$. Thus, w is a prefix of a Lyndon word in $\mathfrak{A}^*$ (because $t^{\ell+1}z$ is a Lyndon word in $\mathfrak{A}^*$). In other words, Assertion $\mathcal{F}'$ holds. This proves the implication $\mathcal{F}'' \Longrightarrow \mathcal{F}'$. This solves Exercise 6.1.32(f) in the partial-order case.

Remark: Of course, for a letter $\mu \in \mathfrak{A}$, if we have ($\mu > a$ for every letter a of w), then we also have ($\mu > a$ for some letter a of w) (since w is nonempty and thus has at least one letter). Hence, Exercise 6.1.32(e) is a particular case of Exercise 6.1.32(f).

Altogether, we have now solved all parts of Exercise 6.1.32 in the partial-order case. Exercise 6.1.33(g) is thus solved.

[*Remark:* The validity of some parts of Exercise 6.1.32 in the partial-order case can also be deduced from their validity in the total-order case using Proposition 13.146.3. For example, the equivalence $\mathcal{B}' \Longleftrightarrow \mathcal{C}' \Longleftrightarrow \mathcal{E}'$ can be treated this way. We shall not give any details of this alternative approach, however.]

13.147. **Solution to Exercise 6.1.34.** *Solution to Exercise 6.1.34.* In the following, whenever G is a group and P is a (left) G-set, we denote by G_u the stabilizer of u in G, that is, the subgroup $\{g \in G \mid gu = u\}$ of G.

Let $C^{(n)}$ denote the subgroup $\langle c^n \rangle$ of the infinite cyclic group C. Then, $C/C^{(n)}$ is a cyclic group with n elements. Hence, $\left|C/C^{(n)}\right| = n$.

Also, recall that c acts on $\mathfrak{A}^n$ by cyclically rotating n-tuples one step to the left ($c \cdot (a_1, a_2, \ldots, a_n) = (a_2, a_3, \ldots, a_n, a_1)$). Thus, c^n acts trivially on $\mathfrak{A}^n$ (since cyclically rotating an n-tuple n steps to the left does nothing). Therefore, the whole subgroup $C^{(n)}$ acts trivially on $\mathfrak{A}^n$ (since $C^{(n)} = \langle c^n \rangle$).

The word "divisor" shall mean "positive divisor" throughout this solution.

(a) Let N be any n-necklace. Then, N is an orbit of the C-action, thus a nonempty set. Fix an element w of N (such a w exists since N is nonempty).

Recall that the subgroup $C^{(n)}$ acts trivially on $\mathfrak{A}^n$. In particular, $C^{(n)}$ stabilizes w. Hence, $C^{(n)} \subset C_w$. Thus, $\left[C : C^{(n)}\right] = [C : C_w] \cdot \left[C_w : C^{(n)}\right]$. As a consequence, $[C : C_w] \mid [C : C_w] \cdot \left[C_w : C^{(n)}\right] = \left[C : C^{(n)}\right] = \left|C/C^{(n)}\right| = n$, so that $[C : C_w] < \infty$.

But N is an orbit of the C-action containing w. Hence, N is the C-orbit of w. Thus, by the orbit-stabilizer theorem, we have $|N| = [C : C_w]$. This yields $|N| = [C : C_w] < \infty$, so that N is a finite set.

Also, $|N| = [C : C_w] \mid n$. This solves Exercise 6.1.34(a).

(b) Let $w = (w_1, w_2, \ldots, w_n) \in \mathfrak{A}^n$ be an n-tuple. We need to prove the equivalence between the following two assertions:

> *Assertion $\mathcal{A}$:* The n-necklace $[w]$ is aperiodic.
>
> *Assertion $\mathcal{B}$:* Every $k \in \{1, 2, \ldots, n-1\}$ satisfies $(w_{k+1}, w_{k+2}, \ldots, w_n, w_1, w_2, \ldots, w_k) \neq w$.

We will achieve this by proving the implications $\mathcal{A} \Longrightarrow \mathcal{B}$ and $\mathcal{B} \Longrightarrow \mathcal{A}$. But let us first do some preparatory work.

Let N denote the n-necklace $[w]$. Thus, $w \in N$ and therefore (as we have shown in the solution of Exercise 6.1.34(a)) we have $C^{(n)} \subset C_w$ and $|N| = [C : C_w]$.

We are now ready to prove implications $\mathcal{A} \Longrightarrow \mathcal{B}$ and $\mathcal{B} \Longrightarrow \mathcal{A}$.

Proof of the implication $\mathcal{A} \Longrightarrow \mathcal{B}$: Assume that Assertion $\mathcal{A}$ holds. In other words, the n-necklace $[w]$ is aperiodic.

In other words, N is aperiodic (since $N = [w]$). In other words, the period of N is n (by the definition of "aperiodic"). In other words, $|N|$ is n (since the period of N is defined as $|N|$). In other words, $|N| = n$. Thus, $n = |N| = [C : C_w]$. But

$$n = \left[C : C^{(n)}\right] = \underbrace{[C : C_w]}_{=n} \cdot \left[C_w : C^{(n)}\right] \qquad \left(\text{since } C^{(n)} \subset C_w\right)$$
$$= n \cdot \left[C_w : C^{(n)}\right].$$

Solving this for $\left[C_w : C^{(n)}\right]$, we obtain $\left[C_w : C^{(n)}\right] = 1$, so that $C^{(n)} = C_w$.

Let now $k \in \{1,2,\ldots,n-1\}$. We are going to prove that $(w_{k+1}, w_{k+2}, \ldots, w_n, w_1, w_2, \ldots, w_k) \neq w$. Indeed, assume the contrary. Thus, $(w_{k+1}, w_{k+2}, \ldots, w_n, w_1, w_2, \ldots, w_k) = w$.

Recall that c acts on $\mathfrak{A}^n$ by cyclically rotating n-tuples one step to the left. Hence, c^k acts on $\mathfrak{A}^n$ by cyclically rotating n-tuples k steps to the left. Hence,

$$c^k w = (w_{k+1}, w_{k+2}, \ldots, w_n, w_1, w_2, \ldots, w_k) = w.$$

Thus, $c^k \in C_w = C^{(n)} = \langle c^n \rangle$. But if an integer $a \in \mathbb{Z}$ satisfies $c^a \in \langle c^n \rangle$, then we must have $n \mid a$ (this follows from the structure of the infinite cyclic group C). Applied to $a = k$, this yields $n \mid k$. But this is absurd, since $k \in \{1,2,\ldots,n-1\}$. This contradiction proves that our assumption was wrong. Hence, we have proven $(w_{k+1}, w_{k+2}, \ldots, w_n, w_1, w_2, \ldots, w_k) \neq w$.

Now, let us forget that we fixed k. We thus have shown that every $k \in \{1,2,\ldots,n-1\}$ satisfies $(w_{k+1}, w_{k+2}, \ldots, w_n, w_1, w_2, \ldots, w_k) \neq w$. In other words, Assertion $\mathcal{B}$ holds. This proves the implication $\mathcal{A} \Longrightarrow \mathcal{B}$.

Proof of the implication $\mathcal{B} \Longrightarrow \mathcal{A}$: Assume that Assertion $\mathcal{B}$ holds. In other words, every $k \in \{1,2,\ldots,n-1\}$ satisfies $(w_{k+1}, w_{k+2}, \ldots, w_n, w_1, w_2, \ldots, w_k) \neq w$.

We will prove that $C^{(n)} = C_w$. Indeed, assume the contrary. Thus, $C^{(n)} \neq C_w$. Since $C^{(n)} \subset C_w$, this yields that $C^{(n)}$ is a proper subset of C_w. Hence, there exists some $d \in C_w$ such that $d \notin C^{(n)}$. Consider this d. Write d in the form $d = c^h$ for some $h \in \mathbb{Z}$ (this is possible since c generates C). Let k denote the remainder of h modulo n. Then, $h - k$ is divisible by n, and thus $c^{h-k} \in \langle c^n \rangle = C^{(n)} \subset C_w$, so that $c^{h-k} w = w$. But also, $c^h w = w$ (since $c^h = d \in C_w$). Hence, $w = \underbrace{c^h}_{=c^k c^{h-k}} w = c^k \underbrace{c^{h-k} w}_{=w} = c^k w$.

But $k \in \{0,1,\ldots,n-1\}$ (since k is a remainder modulo n). We have $c^{h-k} \neq c^h$ (since $c^{h-k} \in C^{(n)}$ whereas $c^h = d \notin C^{(n)}$). Hence, $h-k \neq h$, so that $k \neq 0$. Combined with $k \in \{0,1,\ldots,n-1\}$, this yields $k \in \{0,1,\ldots,n-1\} \backslash \{0\} = \{1,2,\ldots,n-1\}$. Thus, Assertion $\mathcal{B}$ yields that $(w_{k+1}, w_{k+2}, \ldots, w_n, w_1, w_2, \ldots, w_k) \neq w$.

Recall that c acts on $\mathfrak{A}^n$ by cyclically rotating n-tuples one step to the left. Hence, c^k acts on $\mathfrak{A}^n$ by cyclically rotating n-tuples k steps to the left. Hence,

$$c^k w = (w_{k+1}, w_{k+2}, \ldots, w_n, w_1, w_2, \ldots, w_k) \neq w = c^k w.$$

This is absurd. This contradiction shows that our assumption was wrong. Hence, we have shown that $C^{(n)} = C_w$. Now, $|N| = \left[C : \underbrace{C_w}_{=C^{(n)}}\right] = \left[C : C^{(n)}\right] = n$. In other words, the period of N is n (since the period of N is defined as $|N|$). In other words, N is aperiodic (by the definition of "aperiodic"). In other words, $[w]$ is aperiodic (since $N = [w]$). In other words, Assertion $\mathcal{A}$ holds. This proves the implication $\mathcal{B} \Longrightarrow \mathcal{A}$.

Now we have proven both implications $\mathcal{A} \Longrightarrow \mathcal{B}$ and $\mathcal{B} \Longrightarrow \mathcal{A}$. Hence, the Assertions $\mathcal{A}$ and $\mathcal{B}$ are equivalent. Exercise 6.1.34(b) is solved.

Before we come to the solution of Exercise 6.1.34(c), let us state a simple lemma:

Lemma 13.147.1. *Let n be a positive integer. Assume that the set $\mathfrak{A}$ is totally ordered. Let $w \in \mathfrak{A}^n$ be a Lyndon word. Let $k \in \{1,2,\ldots,n-1\}$. Then, $c^k w > w$ in the lexicographic order.*

Proof of Lemma 13.147.1. We have $w = (w_1, w_2, \ldots, w_n)$ (since $w \in \mathfrak{A}^n$). Let $u = (w_1, w_2, \ldots, w_k)$ and $v = (w_{k+1}, w_{k+2}, \ldots, w_n)$. These words u and v are well-defined and nonempty (since $k \in \{1,2,\ldots,n-1\}$) and satisfy

$$\begin{aligned} uv &= (w_1, w_2, \ldots, w_k)(w_{k+1}, w_{k+2}, \ldots, w_n) = (w_1, w_2, \ldots, w_k, w_{k+1}, w_{k+2}, \ldots, w_n) \\ &= (w_1, w_2, \ldots, w_n) = w. \end{aligned}$$

But the n-tuple $c^k w$ is obtained from w by k-fold cyclic rotation to the left (since c acts on $\mathfrak{A}^n$ by cyclically rotating n-tuples one step to the left). In other words,

$$\begin{aligned} c^k w &= (w_{k+1}, w_{k+2}, \ldots, w_n, w_1, w_2, \ldots, w_k) && \left(\text{since } w = (w_1, w_2, \ldots, w_n) \text{ and } k \in \{1, 2, \ldots, n-1\}\right) \\ &= \underbrace{(w_{k+1}, w_{k+2}, \ldots, w_n)}_{=v} \underbrace{(w_1, w_2, \ldots, w_k)}_{=u} = vu > uv && (\text{by Proposition 6.1.14(c)}) \\ &= w. \end{aligned}$$

This proves Lemma 13.147.1. □

(c) Let N be any aperiodic n-necklace. We need to show that N contains exactly one Lyndon word.

Since the necklace N is aperiodic, we know that the period of N is n. In other words, $|N| = n$.

Let w be the lexicographically smallest word contained in N. The word w has n letters (since $w \in N \subset \mathfrak{A}^n$), and thus is nonempty. We will prove that the word w is Lyndon.

Clearly, N is a C-orbit (since N is an n-necklace), and thus N is the orbit of the word w (since $w \in N$). In other words, $N = Cw$.

We can see (as in the solution of Exercise 6.1.34(a)) that $C^{(n)} \subset C_w$ and $|N| = [C : C_w]$. Now, $n = \left[C : C^{(n)}\right] = \underbrace{[C : C_w]}_{=|N|=n} \cdot \left[C_w : C^{(n)}\right] = n \cdot \left[C_w : C^{(n)}\right]$. Thus, $\left[C_w : C^{(n)}\right] = 1$, so that $C_w = C^{(n)}$.

Now, let u and v be two nonempty words satisfying $w = uv$. We will prove that $vu > uv$.

Assume the contrary. Thus, $vu \leq uv$.

We have $w = (w_1, w_2, \ldots, w_n)$ (since $w \in N \subset \mathfrak{A}^n$). Thus, there exists some $k \in \{0, 1, \ldots, n\}$ such that $u = (w_1, w_2, \ldots, w_k)$ and $v = (w_{k+1}, w_{k+2}, \ldots, w_n)$ (since $w = uv$). Consider this k. We have $0 < k < n$ (since u and v are nonempty). Since $v = (w_{k+1}, w_{k+2}, \ldots, w_n)$ and $u = (w_1, w_2, \ldots, w_k)$, we have $vu = (w_{k+1}, w_{k+2}, \ldots, w_n, w_1, w_2, \ldots, w_k)$. In other words, the n-tuple vu is obtained from w by k-fold cyclic rotation to the left. In yet other words, $vu = c^k w$ (since c acts on $\mathfrak{A}^n$ by cyclically rotating n-tuples one step to the left). Hence, $vu = \underbrace{c^k}_{\in C} w \in Cw = N$. Thus, $vu \geq w$ (since w is the lexicographically smallest word contained in N). Combined with $vu \leq uv = w$, this yields $vu = w$. Hence, $c^k w = vu = w$, so that c^k stabilizes w. In other words, $c^k \in C_w = C^{(n)}$. But this is impossible, since $0 < k < n$ (and since $C^{(n)}$ is the subgroup $\langle c^n \rangle$ of C). This contradiction proves that our assumption was wrong. Thus, we have proven that $vu > uv$.

Let us now forget that we fixed u and v. We thus have proven that any nonempty words u and v satisfying $w = uv$ satisfy $vu > uv$. In other words, the word w satisfies Assertion $\mathcal{D}$ of Theorem 6.1.20. Consequently, the word w satisfies Assertion $\mathcal{A}$ of Theorem 6.1.20 as well (since Theorem 6.1.20 yields that these two assertions are equivalent); in other words, w is Lyndon. The orbit N thus contains at least one Lyndon word (namely, w).

We shall next prove that w is the only Lyndon word in N. Indeed, let p be any Lyndon word in N distinct from w. We will derive a contradiction.

It is easy to see that there exists a $k \in \{1, 2, \ldots, n-1\}$ satisfying $p = c^k w$ [1026]. Consider this k. Then, $w = c^{n-k} p$ [1027]. Notice that $n - k \in \{1, 2, \ldots, n-1\}$ (since $k \in \{1, 2, \ldots, n-1\}$) and $p \in N \subset \mathfrak{A}^n$. Hence, Lemma 13.147.1 (applied to p and $n-k$ instead of w and k) yields that $c^{n-k} p > p$. Hence, $p < c^{n-k} p = w$.

[1026] *Proof.* We have $p \in N = Cw$. Hence, there exists some $e \in C$ satisfying $p = ew$. Consider this e.

We know that $C^{(n)}$ acts trivially on $\mathfrak{A}^n$, and thus stabilizes w. Hence, $C^{(n)} w = \{w\}$.

By the well-known properties of the infinite cyclic group, we know that the elements c^0, c^1, ..., c^{n-1} of C form a system of unique representatives for the cosets of $C^{(n)}$ in C. Hence, every $d \in C$ belongs to the coset $c^\ell C^{(n)}$ for some $\ell \in \{0, 1, \ldots, n-1\}$. Applied to $d = e$, this yields that e belongs to the coset $c^\ell C^{(n)}$ for some $\ell \in \{0, 1, \ldots, n-1\}$. Consider this ℓ. We have $e \in c^\ell C^{(n)}$, thus $p = \underbrace{e}_{\in c^\ell C^{(n)}} w \in c^\ell \underbrace{C^{(n)} w}_{=\{w\}} = c^\ell \{w\} = \{c^\ell w\}$, so that $p = c^\ell w$.

If $\ell = 0$, then $p = \underbrace{c^\ell}_{=c^0 = 1_C} w = 1_C w = w$, which contradicts the fact that p is distinct from w. Hence, we cannot have $\ell = 0$. Thus, $\ell \in \{0, 1, \ldots, n-1\} \setminus \{0\} = \{1, 2, \ldots, n-1\}$. Hence, there exists a $k \in \{1, 2, \ldots, n-1\}$ satisfying $p = c^k w$ (namely, $k = \ell$), qed.

[1027] *Proof.* We know that c^n acts trivially on $\mathfrak{A}^n$. Thus, $c^n w = w$. Hence, $w = \underbrace{c^n}_{=c^{n-k} c^k} w = c^{n-k} \underbrace{c^k w}_{=p} = c^{n-k} p$, qed.

Since $p \in N$, this shows that there exists an element of N which is lexicographically smaller than w (namely, p). This contradicts the fact that w is the lexicographically smallest word contained in N.

Now, let us forget that we fixed w. We thus have obtained a contradiction for every Lyndon word p in N distinct from w. Thus, there exists no Lyndon word p in N distinct from w. Hence, w is the only Lyndon word in N. Since we already know that w is a Lyndon word in N, this yields that N contains exactly one Lyndon word (namely, w). This solves Exercise 6.1.34(c).

(d) Let N be an n-necklace which is not aperiodic. We shall prove that N contains no Lyndon word.

Indeed, assume the contrary. Then, N contains a Lyndon word. Let w be this Lyndon word.

But the n-necklace N is not aperiodic. Thus, $|N| \neq n$ (since N is aperiodic if and only if $|N| = n$). We can see (as in the solution of Exercise 6.1.34(a)) that $|N| = [C : C_w]$. Thus, $[C : C_w] = |N| \neq n = \left[C : C^{(n)}\right]$, so that $C_w \neq C^{(n)}$. But $C^{(n)} \subset C_w$ (this can be proven just as in the solution of Exercise 6.1.34(a)). Hence, $C^{(n)}$ is a proper subset of C_w. Hence, there exists some $e \in C_w$ such that $e \notin C^{(n)}$. Consider this e.

We have $ew = w$ (since $e \in C_w$). It is now easy to see that there exists a $k \in \{1, 2, \ldots, n-1\}$ such that $c^k w = w$ [1028]. Consider this k. Lemma 13.147.1 yields $c^k w > w$ (since $w \in N \subset \mathfrak{A}^n$), which contradicts $c^k w = w$. This contradiction proves that our assumption was false. Thus, N contains no Lyndon word. This solves Exercise 6.1.34(d).

(e) If w is a Lyndon word of length n, then $[w]$ is an aperiodic n-necklace[1029]. Hence, the map

$$\text{(the set of all Lyndon words of length } n) \to \text{(the set of all aperiodic } n\text{-necklaces)}\,,$$
$$w \mapsto [w]$$

is well-defined. Denote this map by Φ. This map Φ is injective[1030] and surjective[1031]. Hence, Φ is bijective. In other words, Φ is a bijection between the set of all Lyndon words of length n and the set of all aperiodic n-necklaces. Thus, the aperiodic n-necklaces are in bijection with Lyndon words of length n. This solves Exercise 6.1.34(e).

Before we start solving Exercise 6.1.34(f), we state a lemma about words:

Lemma 13.147.2. *Let N be a positive integer, and let $w \in \mathfrak{A}^N$. Let p be a positive divisor of N. Assume that $c^p w = w$. Then, there exists a word $q \in \mathfrak{A}^p$ such that $w = q^{N/p}$.*

Proof of Lemma 13.147.2. (The following proof is overkill, but it is the simplest proof to formalize.)

Notice that N/p is a positive integer (since p is a positive divisor of N), so that $N/p - 1 \in \mathbb{N}$.

[1028] *Proof.* We know that $C^{(n)}$ acts trivially on $\mathfrak{A}^n$, and thus stabilizes w. Hence, $C^{(n)} w = \{w\}$.

By the well-known properties of the infinite cyclic group, we know that the elements c^0, c^1, ..., c^{n-1} of C form a system of unique representatives for the cosets of $C^{(n)}$ in C. Hence, every $d \in C$ belongs to the coset $c^\ell C^{(n)}$ for some $\ell \in \{0, 1, \ldots, n-1\}$. Applied to $d = e$, this yields that e belongs to the coset $c^\ell C^{(n)}$ for some $\ell \in \{0, 1, \ldots, n-1\}$. Consider this ℓ. We have $e \in c^\ell C^{(n)}$, thus $w = \underbrace{e}_{\in c^\ell C^{(n)}} w \in c^\ell \underbrace{C^{(n)} w}_{=\{w\}} = c^\ell \{w\} = \left\{c^\ell w\right\}$, so that $w = c^\ell w$. Thus, $c^\ell w = w$.

If $\ell = 0$, then $e \in \underbrace{c^\ell}_{=c^0 = 1_C} C^{(n)} = 1^C C^{(n)} = C^{(n)}$, which contradicts $e \notin C^{(n)}$. Hence, we cannot have $\ell = 0$. Thus, $\ell \in \{0, 1, \ldots, n-1\} \setminus \{0\} = \{1, 2, \ldots, n-1\}$. Hence, there exists a $k \in \{1, 2, \ldots, n-1\}$ satisfying $c^k w = w$ (namely, $k = \ell$), qed.

[1029] *Proof.* Let w be a Lyndon word of length n. Then, $[w]$ is an n-necklace. If $[w]$ was not aperiodic, then the necklace $[w]$ would contain no Lyndon word (by Exercise 6.1.34(d), applied to $N = [w]$), which would contradict the fact that this necklace $[w]$ contains the Lyndon word w. Hence, $[w]$ must be aperiodic, qed.

[1030] *Proof.* Let w and w' be two Lyndon words of length n such that $\Phi(w) = \Phi(w')$. We shall prove that $w = w'$.

We have $\Phi(w) = [w]$ (by the definition of Φ) and $\Phi(w') = [w']$ (similarly). Thus, $[w'] = \Phi(w') = \Phi(w) = [w]$.

The word w is contained in $[w]$ (obviously), and the word w' is contained in $[w'] = [w]$. Thus, both w and w' are contained in $[w]$.

We know that $[w]$ is an aperiodic n-necklace. Hence, $[w]$ contains exactly one Lyndon word (by Exercise 6.1.34(c)). Hence, any two Lyndon words contained in $[w]$ must be identical. Applying this to the two Lyndon words w and w' both contained in $[w]$, we obtain that w and w' are identical, i.e., we have $w = w'$.

Let us now forget that we fixed w and w'. We have thus proven that any two Lyndon words w and w' of length n satisfying $\Phi(w) = \Phi(w')$ must satisfy $w = w'$. In other words, the map Φ is injective, qed.

[1031] *Proof.* Let N be an aperiodic n-necklace. Hence, N contains exactly one Lyndon word (by Exercise 6.1.34(c)). Let w be this Lyndon word. The definition of Φ yields $\Phi(w) = [w] = N$ (since N is the aperiodic n-necklace containing w). Thus, $N = \Phi(w) \in \operatorname{Im} \Phi$.

Now, let us forget that we fixed N. We have thus shown that $N \in \operatorname{Im} \Phi$ for every aperiodic n-necklace N. In other words, the map Φ is surjective, qed.

We have $w = (w_1, w_2, \ldots, w_N)$ (since $w \in \mathfrak{A}^N$). Let $u = (w_1, w_2, \ldots, w_p)$ and $v = (w_{p+1}, w_{p+2}, \ldots, w_N)$. (These u and v are well-defined since $p \in \{0, 1, \ldots, N\}$.) Then,

$$\begin{aligned}\underbrace{u}_{=(w_1,w_2,\ldots,w_p)} \underbrace{v}_{=(w_{p+1},w_{p+2},\ldots,w_N)} &= (w_1, w_2, \ldots, w_p)(w_{p+1}, w_{p+2}, \ldots, w_N) \\ &= (w_1, w_2, \ldots, w_p, w_{p+1}, w_{p+2}, \ldots, w_N) \\ &= (w_1, w_2, \ldots, w_N) = w.\end{aligned}$$

On the other hand, c acts on $\mathfrak{A}^N$ by cyclically rotating N-tuples one step to the left. Hence, $c^p w$ is the result of cyclically rotating the N-tuple w to the left p times. In other words,

$$c^p w = (w_{p+1}, w_{p+2}, \ldots, w_N, w_1, w_2, \ldots, w_p) = \underbrace{(w_{p+1}, w_{p+2}, \ldots, w_N)}_{=v} \underbrace{(w_1, w_2, \ldots, w_p)}_{=u} = vu.$$

Compared with $c^p w = w = uv$, this yields $uv = vu$. Hence, Proposition 6.1.4 yields that there exist a $t \in \mathfrak{A}^*$ and two nonnegative integers n and m such that $u = t^n$ and $v = t^m$. Consider this t and these n and m. We have $u = (w_1, w_2, \ldots, w_p)$, so that $u \in \mathfrak{A}^p$ and thus $\ell(u) = p$. Hence, $p = \ell\left(\underbrace{u}_{=t^n}\right) = \ell(t^n) = n\ell(t)$, so that $n\ell(t) = p$. On the other hand, $v = (w_{p+1}, w_{p+2}, \ldots, w_N)$, so that $\ell(v) = N - p$ and thus $N - p = \ell\left(\underbrace{v}_{=t^m}\right) = \ell(t^m) = m\ell(t)$ and thus $m\ell(t) = N - p$. Now, $n\ell(t) = p \neq 0$. Hence, $n \neq 0$ and $\ell(t) \neq 0$. Now,

$$\begin{aligned}\frac{m}{n} &= \frac{m\ell(t)}{n\ell(t)} = \frac{N-p}{p} \qquad \text{(since } m\ell(t) = N - p \text{ and } n\ell(t) = p\text{)} \\ &= N/p - 1,\end{aligned}$$

so that $m = n \cdot (N/p - 1)$. Hence, $t^m = t^{n \cdot (N/p-1)} = \left(\underbrace{t^n}_{=u}\right)^{N/p-1} = u^{N/p-1}$. Now, $w = u \underbrace{v}_{=t^m = u^{N/p-1}} = uu^{N/p-1} = u^{N/p}$. Hence, there exists a word $q \in \mathfrak{A}^p$ such that $w = q^{N/p}$ (namely, $q = u$). Lemma 13.147.2 is proven. □

We also recall a lemma about the functions μ and ϕ:

Lemma 13.147.3. *Every positive integer n satisfies*

$$\sum_{d|n} \mu(d) = \delta_{n,1}; \tag{13.147.1}$$

$$\sum_{d|n} \mu(d) \frac{n}{d} = \phi(n). \tag{13.147.2}$$

Proof of Lemma 13.147.3. Both equalities (13.147.1) and (13.147.2) have been proven in the solution of Exercise 2.9.6. (Indeed, (13.147.1) is (13.84.3), and (13.147.2) is (13.84.5).) □

In Exercise 6.1.34, an action of the cyclic group C on $\mathfrak{A}^n$ was defined. In the same way, we define an action of the cyclic group C on $\mathfrak{A}^m$ for any positive integer m. The orbits of this latter C-action will be called the *m-necklaces*. (The notion of "n-necklaces" defined in Exercise 6.1.34 is clearly a particular case of this.) We define the notions of "period" and "aperiodic" for m-necklaces in the same way as they were defined for n-necklaces in Exercise 6.1.34. We will use the same notations for m-necklaces as we do for n-necklaces (i.e., the m-necklace containing a given $w \in \mathfrak{A}^m$ will be denoted by $[w]$).

Let us now state a few lemmas about the actions of C on words:

Lemma 13.147.4. *Let m be a positive integer. Let $u \in \mathfrak{A}$ be a letter. Let $v \in \mathfrak{A}^{m-1}$ be a word. Then,*

$$c(uv) = vu$$

(where we identify the letter u with the one-letter word (u)).

Proof of Lemma 13.147.4. From $v \in \mathfrak{A}^{m-1}$, we obtain $v = (v_1, v_2, \ldots, v_{m-1})$, so that

$$\underbrace{u}_{=(u)} \underbrace{v}_{=(v_1,v_2,\ldots,v_{m-1})} = (u)(v_1, v_2, \ldots, v_{m-1}) = (u, v_1, v_2, \ldots, v_{m-1}).$$

But recall that c acts on $\mathfrak{A}^m$ by cyclically rotating m-tuples one step to the left. Thus,

$$c(u, v_1, v_2, \ldots, v_{m-1}) = (v_1, v_2, \ldots, v_{m-1}, u) = \underbrace{(v_1, v_2, \ldots, v_{m-1})}_{=v} \underbrace{(u)}_{=u} = vu.$$

Hence,

$$c \underbrace{(uv)}_{=(u,v_1,v_2,\ldots,v_{m-1})} = c(u, v_1, v_2, \ldots, v_{m-1}) = vu,$$

and thus Lemma 13.147.4 is proven. □

Lemma 13.147.5. *Let n be a positive integer. Let d be a positive divisor of n. Thus, n/d is a positive integer.*

Define a map

$$\Delta : \mathfrak{A}^{n/d} \to \mathfrak{A}^n,$$
$$w \mapsto w^d$$

(where, as we recall, w^d means the d-fold concatenation $\underbrace{ww\cdots w}_{d \text{ times}}$ of w with itself).

Then:

(a) *This map Δ is well-defined.*
(b) *The map Δ is C-equivariant (meaning that $\Delta(gw) = g \cdot \Delta(w)$ for every $g \in C$ and $w \in \mathfrak{A}^{n/d}$).*
(c) *The map Δ is injective.*

Proof of Lemma 13.147.5. (a) If $w \in \mathfrak{A}^{n/d}$, then the word w^d has length

$$\ell\left(w^d\right) = d \underbrace{\ell(w)}_{\substack{=n/d \\ (\text{since } w \in \mathfrak{A}^{n/d})}} = d(n/d) = n$$

and thus satisfies $w^d \in \mathfrak{A}^n$. Hence, the map Δ is well-defined. This proves Lemma 13.147.5(a).

(b) We need to show that Δ is C-equivariant. Clearly, it is enough to prove that $\Delta(cw) = c \cdot \Delta(w)$ for every $w \in \mathfrak{A}^{n/d}$ (since c generates the group C). So let us prove this.

Let $w \in \mathfrak{A}^{n/d}$. Thus, $w = \left(w_1, w_2, \ldots, w_{n/d}\right)$. Let $\overline{w}$ denote the word $\left(w_2, w_3, \ldots, w_{n/d}\right)$. Then, (identifying the letter w_1 with the one-letter word (w_1)) we have

$$\underbrace{w_1}_{=(w_1)} \underbrace{\overline{w}}_{=\left(w_2,w_3,\ldots,w_{n/d}\right)} = (w_1)\left(w_2, w_3, \ldots, w_{n/d}\right) = \left(w_1, w_2, w_3, \ldots, w_{n/d}\right) = \left(w_1, w_2, \ldots, w_{n/d}\right) = w.$$

Thus, $w = w_1\overline{w}$, so that

$$cw = c(w_1\overline{w}) = \overline{w}w_1 \qquad (\text{by Lemma 13.147.4, applied to } m = n/d,\ u = w_1 \text{ and } v = \overline{w}).$$

Also, it is easy to see that

$$(pq)^d = p(qp)^{d-1} q \qquad \text{for any } p \in \mathfrak{A}^* \text{ and } q \in \mathfrak{A}^*. \tag{13.147.3}$$

[1032].

Taking both sides of the equality $w = w_1\overline{w}$ to the d-th power, we obtain

$$w^d = (w_1\overline{w})^d = w_1(\overline{w}w_1)^{d-1}\overline{w} \qquad (\text{by (13.147.3), applied to } p = w_1 \text{ and } q = \overline{w}).$$

[1032] *Proof.* Let $p \in \mathfrak{A}^*$ and $q \in \mathfrak{A}^*$. Then,

$$(pq)^d = \underbrace{(pq)(pq)\cdots(pq)}_{d \text{ times}} = p \underbrace{\underbrace{(qp)(qp)\cdots(qp)}_{d-1 \text{ times}}}_{=(qp)^{d-1}} q = p(qp)^{d-1} q,$$

qed.

The definition of Δ yields $\Delta(w) = w^d = w_1 (\overline{w} w_1)^{d-1} \overline{w}$. Applying c to both sides of this identity, we obtain

$$\begin{aligned} c \cdot \Delta(w) &= c \cdot \left(w_1 (\overline{w} w_1)^{d-1} \overline{w} \right) = (\overline{w} w_1)^{d-1} \overline{w} w_1 \\ &\qquad \left(\text{by Lemma 13.147.4, applied to } m = n,\ u = w_1 \text{ and } v = (\overline{w} w_1)^{d-1} \overline{w} \right) \\ &= (\overline{w} w_1)^{d-1} (\overline{w} w_1) = \left(\underbrace{\overline{w} w_1}_{=cw} \right)^d = (cw)^d . \end{aligned}$$

Compared with $\Delta(cw) = (cw)^d$ (by the definition of Δ), this yields $\Delta(cw) = c \cdot \Delta(w)$. We thus have shown that Δ is C-equivariant. This proves Lemma 13.147.5(b).

(c) We need to prove that Δ is injective. In other words, we need to prove that every $w \in \mathfrak{A}^{n/d}$ can be reconstructed from $\Delta(w)$. But this is easy: Since $\Delta(w) = w^d$ (by the definition of Δ), the word w can be obtained from $\Delta(w)$ by taking the first n/d letters of $\Delta(w)$. Hence, w can be reconstructed from $\Delta(w)$. This proves Lemma 13.147.5(c).

□

We now step to the solution of Exercise 6.1.34(f):

(f) Exercise 6.1.34(a) yields that for any n-necklace N, we have $|N| \mid n$. Hence, for any n-necklace N, the cardinality $|N|$ is a divisor of n (since $|N| \in \mathbb{N}$). Now, recall that the n-necklaces are the orbits of the C-action on $\mathfrak{A}^n$, and therefore form a set partition of the set $\mathfrak{A}^n$. Hence,

$$|\mathfrak{A}^n| = \sum_{N \text{ is an } n\text{-necklace}} |N| = \sum_{d \mid n} \sum_{\substack{N \text{ is an } n\text{-necklace;} \\ |N| = d}} d$$

(because for any n-necklace N, the cardinality $|N|$ is a divisor of n). Hence,

$$|\mathfrak{A}|^n = |\mathfrak{A}^n| = \sum_{d \mid n} \underbrace{\sum_{\substack{N \text{ is an } n\text{-necklace;} \\ |N| = d}} d}_{= d |\{N \text{ is an } n\text{-necklace} \mid |N| = d\}|} = \sum_{d \mid n} d \left| \{ N \text{ is an } n\text{-necklace} \mid |N| = d \} \right| . \qquad (13.147.4)$$

Now, for every positive integer e, let $\operatorname{Aper}(e)$ denote the set of all aperiodic e-necklaces. We shall now prove that

$$\left| \{ N \text{ is an } n\text{-necklace} \mid |N| = n/d \} \right| = \left| \operatorname{Aper}(n/d) \right| \qquad (13.147.5)$$

for every divisor d of n.

Proof of (13.147.5): Let d be a divisor of n. Then, n/d is a positive integer. We can thus define a map

$$\Delta : \mathfrak{A}^{n/d} \to \mathfrak{A}^n, \qquad w \mapsto w^d$$

(where, as we recall, w^d means the d-fold concatenation $\underbrace{ww \cdots w}_{d \text{ times}}$ of w with itself). Lemma 13.147.5(a) shows that this map Δ is well-defined. Lemma 13.147.5(b) shows that this map Δ is C-equivariant (meaning that $\Delta(gw) = g \cdot \Delta(w)$ for every $g \in C$ and $w \in \mathfrak{A}^{n/d}$). Lemma 13.147.5(c) shows that this map Δ is injective.

Since the map Δ is C-equivariant, it gives rise to a map

$$\overline{\Delta} : \left(\text{the set of all } C\text{-orbits on } \mathfrak{A}^{n/d} \right) \to \left(\text{the set of all } C\text{-orbits on } \mathfrak{A}^n \right), \qquad N \mapsto \Delta(N) .$$

Consider this map $\overline{\Delta}$. The map $\overline{\Delta}$ is injective[1033]. Furthermore, $\overline{\Delta}$ is a map from the set of all C-orbits on $\mathfrak{A}^{n/d}$ to the set of all C-orbits on $\mathfrak{A}^n$. In other words, $\overline{\Delta}$ is a map from the set of all (n/d)-necklaces to the

[1033] *Proof.* Let P and Q be two C-orbits on $\mathfrak{A}^{n/d}$ such that $\overline{\Delta}(P) = \overline{\Delta}(Q)$. We want to show that $P = Q$.

By the definition of $\overline{\Delta}$, we have $\overline{\Delta}(P) = \Delta(P)$ and $\overline{\Delta}(Q) = \Delta(Q)$. Thus, $\Delta(P) = \overline{\Delta}(P) = \overline{\Delta}(Q) = \Delta(Q)$.

The orbit P is nonempty, and thus contains an element. Let p be such an element.

set of all n-necklaces (since the C-orbits on $\mathfrak{A}^{n/d}$ are the (n/d)-necklaces, and the C-orbits on $\mathfrak{A}^n$ are the n-necklaces). It is now easy to see that

$$\overline{\Delta}\left(\operatorname{Aper}\left(n/d\right)\right) \subset \left\{N \text{ is an } n\text{-necklace} \ \mid \ \left|N\right| = n/d\right\}. \tag{13.147.6}$$

[1034] But we also have

$$\left\{N \text{ is an } n\text{-necklace} \ \mid \ \left|N\right| = n/d\right\} \subset \overline{\Delta}\left(\operatorname{Aper}\left(n/d\right)\right). \tag{13.147.7}$$

Proof of (13.147.7): Let $P \in \left\{N \text{ is an } n\text{-necklace} \ \mid \ \left|N\right| = n/d\right\}$. Thus, P is an n-necklace such that $\left|P\right| = n/d$. We shall now prove that $P \in \overline{\Delta}\left(\operatorname{Aper}\left(n/d\right)\right)$.

The set P is an n-necklace, thus a C-orbit on $\mathfrak{A}^n$, thus nonempty. Pick some $w \in P$ (this clearly exists since P is nonempty). Then P is the C-orbit of w. Hence, by the orbit-stabilizer theorem, we have $\left|P\right| = \left[C : C_w\right]$. Hence, $\left[C : C_w\right] = \left|P\right| = n/d$. Hence, C_w is a subgroup of C having index n/d. Since the only subgroup of C having index n/d is $\left\langle c^{n/d}\right\rangle$ [1035], this yields that C_w is $\left\langle c^{n/d}\right\rangle$. Hence, $C_w = \left\langle c^{n/d}\right\rangle$, so that $c^{n/d} \in \left\langle c^{n/d}\right\rangle = C_w$, and thus $c^{n/d} w = w$. Now, Lemma 13.147.2 (applied to $N = n$ and $p = n/d$) yields that there exists a word $q \in \mathfrak{A}^{n/d}$ such that $w = q^{n/(n/d)}$. Consider this q. We have $w = q^{n/(n/d)} = q^d$, whereas the definition of Δ yields $\Delta\left(q\right) = q^d$. Thus, $w = q^d = \Delta\left(\underbrace{q}_{\in [q]}\right) \in \Delta\left(\left[q\right]\right)$. The definition of $\overline{\Delta}$ yields $\overline{\Delta}\left(\left[q\right]\right) = \Delta\left(\left[q\right]\right)$. Hence, $w \in \Delta\left(\left[q\right]\right) = \overline{\Delta}\left(\left[q\right]\right)$. Thus, $\overline{\Delta}\left(\left[q\right]\right)$ is the C-orbit on $\mathfrak{A}^n$ containing w (since $\overline{\Delta}\left(\left[q\right]\right)$ is a C-orbit on $\mathfrak{A}^n$ (since $\overline{\Delta}\left(\left[q\right]\right)$ is an n-necklace)). In other words, $\overline{\Delta}\left(\left[q\right]\right)$ is the C-orbit of w. Hence, $\overline{\Delta}\left(\left[q\right]\right) = P$ (since P is the C-orbit of w).

But $P = \overline{\Delta}\left(\left[q\right]\right) = \Delta\left(\left[q\right]\right)$ and thus $\left|P\right| = \left|\Delta\left(\left[q\right]\right)\right| = \left|\left[q\right]\right|$ (since Δ is injective), so that $\left|\left[q\right]\right| = \left|P\right| = n/d$. By the definition of the period of an (n/d)-necklace, we see that the period of the (n/d)-necklace $[q]$ is $\left|\left[q\right]\right| = n/d$. In other words, the (n/d)-necklace $[q]$ is aperiodic (by the definition of "aperiodic"). In other words, $[q] \in \operatorname{Aper}\left(n/d\right)$ (since $\operatorname{Aper}\left(n/d\right)$ is the set of all aperiodic (n/d)-necklaces). Now, $P = \overline{\Delta}\left(\underbrace{\left[q\right]}_{\in \operatorname{Aper}(n/d)}\right) \in \overline{\Delta}\left(\operatorname{Aper}\left(n/d\right)\right)$.

Let us now forget that we fixed P. We thus have proven that every $P \in \left\{N \text{ is an } n\text{-necklace} \ \mid \ \left|N\right| = n/d\right\}$ satisfies $P \in \overline{\Delta}\left(\operatorname{Aper}\left(n/d\right)\right)$. In other words, $\left\{N \text{ is an } n\text{-necklace} \ \mid \ \left|N\right| = n/d\right\} \subset \overline{\Delta}\left(\operatorname{Aper}\left(n/d\right)\right)$. This proves (13.147.7).

Combining (13.147.6) with (13.147.7), we obtain

$$\overline{\Delta}\left(\operatorname{Aper}\left(n/d\right)\right) = \left\{N \text{ is an } n\text{-necklace} \ \mid \ \left|N\right| = n/d\right\}.$$

We have $\Delta\left(\underbrace{p}_{\in P}\right) \in \Delta\left(P\right) = \Delta\left(Q\right)$. Hence, there exists some $q \in Q$ such that $\Delta\left(p\right) = \Delta\left(q\right)$. Consider this q. We have $\Delta\left(p\right) = \Delta\left(q\right)$, and thus $p = q$ (since Δ is injective). The element p belongs to $P \cap Q$ (since $p \in P$ and $p = q \in Q$), and thus the two orbits P and Q have an element in common (namely, p). But any two orbits which have an element in common must be identical. Thus, P and Q are identical, i.e., we have $P = Q$.

Let us forget that we fixed P and Q. We thus have shown that any two C-orbits P and Q on $\mathfrak{A}^{n/d}$ which satisfy $\overline{\Delta}\left(P\right) = \overline{\Delta}\left(Q\right)$ must satisfy $P = Q$. In other words, the map $\overline{\Delta}$ is injective.

[1034] *Proof.* Let $M \in \operatorname{Aper}\left(n/d\right)$. Then, M is an aperiodic (n/d)-necklace (since $\operatorname{Aper}\left(n/d\right)$ is the set of all aperiodic (n/d)-necklaces). In other words, M is an (n/d)-necklace whose period is n/d.

The period of M is defined to be $\left|M\right|$. Thus, $\left|M\right|$ is n/d (since the period of M is n/d). In other words, $\left|M\right| = n/d$. But the definition of $\overline{\Delta}$ yields $\overline{\Delta}\left(M\right) = \Delta\left(M\right)$, thus

$$\begin{aligned} \left|\overline{\Delta}\left(M\right)\right| = \left|\Delta\left(M\right)\right| &= \left|M\right| \qquad \left(\text{since } \Delta \text{ is injective}\right) \\ &= n/d. \end{aligned}$$

Hence, $\overline{\Delta}\left(M\right) \in \left\{N \text{ is an } n\text{-necklace} \ \mid \ \left|N\right| = n/d\right\}$ (since $\overline{\Delta}\left(M\right)$ is an n-necklace (because $\overline{\Delta}$ is a map from the set of all (n/d)-necklaces to the set of all n-necklaces)).

Now, let us forget that we fixed M. We thus have proven that $\overline{\Delta}\left(M\right) \in \left\{N \text{ is an } n\text{-necklace} \ \mid \ \left|N\right| = n/d\right\}$ for every $M \in \operatorname{Aper}\left(n/d\right)$. In other words, $\overline{\Delta}\left(\operatorname{Aper}\left(n/d\right)\right) \subset \left\{N \text{ is an } n\text{-necklace} \ \mid \ \left|N\right| = n/d\right\}$. This proves (13.147.6).

[1035] This is a particular case of the following elementary fact: If e is a positive integer, then the only subgroup of C having index e is $\left\langle c^e\right\rangle$. (This is because $C \cong \left(\mathbb{Z}, +\right)$, and because the only subgroup of $\left(\mathbb{Z}, +\right)$ having index e is $e\mathbb{Z}$.)

Hence,

$$\left|\overline{\Delta}\left(\operatorname{Aper}\left(n/d\right)\right)\right| = \left|\left\{N \text{ is an } n\text{-necklace} \ \mid \ \left|N\right| = n/d\right\}\right|,$$

so that

$$\left|\left\{N \text{ is an } n\text{-necklace} \ \mid \ \left|N\right| = n/d\right\}\right| = \left|\overline{\Delta}\left(\operatorname{Aper}\left(n/d\right)\right)\right| = \left|\operatorname{Aper}\left(n/d\right)\right|$$

(since $\overline{\Delta}$ is injective). This proves (13.147.5).

Now, every divisor d of n satisfies

$$\begin{aligned} \left|\left\{N \text{ is an } n\text{-necklace} \ \mid \ \left|N\right| = \underbrace{d}_{=n/(n/d)}\right\}\right| &= \left|\left\{N \text{ is an } n\text{-necklace} \ \mid \ \left|N\right| = n/\left(n/d\right)\right\}\right| \\ &= \left|\operatorname{Aper}\left(\underbrace{n/\left(n/d\right)}_{=d}\right)\right| \\ &\qquad \left(\text{by (13.147.5), applied to } n/d \text{ instead of } d\right) \\ &= \left|\operatorname{Aper}\left(d\right)\right|. \end{aligned} \tag{13.147.8}$$

Now, (13.147.4) becomes

$$\left|\mathfrak{A}\right|^{n} = \sum_{d\mid n} d \underbrace{\left|\left\{N \text{ is an } n\text{-necklace} \ \mid \ \left|N\right| = d\right\}\right|}_{\substack{=\left|\operatorname{Aper}(d)\right| \\ \text{(by (13.147.8))}}} = \sum_{d\mid n} d\left|\operatorname{Aper}\left(d\right)\right| = \sum_{e\mid n} e\left|\operatorname{Aper}\left(e\right)\right| \tag{13.147.9}$$

(here, we renamed the summation index d as e). Now,

$$\begin{aligned} \sum_{d\mid n} \mu\left(d\right) \underbrace{\left|\mathfrak{A}\right|^{n/d}}_{\substack{=\sum_{e\mid n/d} e\left|\operatorname{Aper}(e)\right| \\ \text{(by (13.147.9), applied to} \\ n/d \text{ instead of } n)}} &= \sum_{d\mid n} \mu\left(d\right) \sum_{e\mid n/d} e\left|\operatorname{Aper}\left(e\right)\right| = \underbrace{\sum_{d\mid n} \sum_{e\mid n/d}}_{=\sum_{e\mid n} \sum_{d\mid n/e}} \mu\left(d\right) e\left|\operatorname{Aper}\left(e\right)\right| \\ &= \sum_{e\mid n} \sum_{d\mid n/e} \mu\left(d\right) e\left|\operatorname{Aper}\left(e\right)\right| = \sum_{e\mid n} \underbrace{\left(\sum_{d\mid n/e} \mu\left(d\right)\right)}_{\substack{=\delta_{n/e,1} \\ \text{(by (13.147.1), applied} \\ \text{to } n/e \text{ instead of } n)}} e\left|\operatorname{Aper}\left(e\right)\right| \\ &= \sum_{e\mid n} \underbrace{\delta_{n/e,1}}_{=\delta_{n,e}} e\left|\operatorname{Aper}\left(e\right)\right| = \sum_{e\mid n} \delta_{n,e} e\left|\operatorname{Aper}\left(e\right)\right| = n\left|\operatorname{Aper}\left(n\right)\right|. \end{aligned}$$

Solving this for $\left|\operatorname{Aper}\left(n\right)\right|$, we obtain

$$\left|\operatorname{Aper}\left(n\right)\right| = \frac{1}{n} \sum_{d\mid n} \mu\left(d\right) \left|\mathfrak{A}\right|^{n/d}. \tag{13.147.10}$$

Now, let us recall that $\operatorname{Aper}\left(n\right)$ is the set of all aperiodic n-necklaces. Thus,

$$\left|\operatorname{Aper}\left(n\right)\right| = \left(\text{the number of all aperiodic } n\text{-necklaces}\right).$$

Hence,

$$\left(\text{the number of all aperiodic } n\text{-necklaces}\right) = \left|\operatorname{Aper}\left(n\right)\right| = \frac{1}{n} \sum_{d\mid n} \mu\left(d\right) \left|\mathfrak{A}\right|^{n/d}.$$

This solves Exercise 6.1.34(f).

(g) We shall use the notations we introduced in the solution of Exercise 6.1.34(f).

We have seen (in the solution of Exercise 6.1.34(f)) that for any n-necklace N, the cardinality $|N|$ is a divisor of n. Hence,

$$\begin{aligned}
&(\text{the number of all } n\text{-necklaces}) \\
&= \sum_{d|n} \underbrace{(\text{the number of all } n\text{-necklaces } N \text{ such that } |N| = d)}_{\substack{=|\{N \text{ is an } n\text{-necklace} \ | \ |N|=d\}|=|\operatorname{Aper}(d)| \\ (\text{by } (13.147.8))}} \\
&= \sum_{d|n} |\operatorname{Aper}(d)| = \sum_{e|n} \underbrace{|\operatorname{Aper}(e)|}_{\substack{=\frac{1}{e}\sum_{d|e}\mu(d)|\mathfrak{A}|^{e/d} \\ (\text{by } (13.147.10)\text{, applied to } e \\ \text{instead of } n)}} \qquad (\text{here, we renamed the summation index } d \text{ as } e) \\
&= \sum_{e|n} \frac{1}{e} \sum_{d|e} \mu(d) |\mathfrak{A}|^{e/d} = \underbrace{\sum_{e|n} \sum_{d|e}}_{=\sum_{d|n} \sum_{\substack{e|n; \\ d|e}}} \frac{1}{e} \mu(d) |\mathfrak{A}|^{e/d} = \sum_{d|n} \sum_{\substack{e|n; \\ d|e}} \frac{1}{e} \mu(d) |\mathfrak{A}|^{e/d} \\
&= \underbrace{\sum_{d|n} \sum_{e|n/d}}_{=\sum_{e|n}\sum_{d|n/e}} \frac{1}{de} \mu(d) |\mathfrak{A}|^{e} \qquad (\text{here, we have substituted } de \text{ for } e \text{ in the inner sum})
\end{aligned}$$

(13.147.11)
$$= \sum_{e|n} \sum_{d|n/e} \frac{1}{de} \mu(d) |\mathfrak{A}|^{e}.$$

From (13.147.2), we have

$$\phi(n) = \sum_{d|n} \mu(d) \frac{n}{d}. \qquad (13.147.12)$$

Now,

$$\begin{aligned}
\frac{1}{n} \sum_{d|n} \phi(d) |\mathfrak{A}|^{n/d} &= \frac{1}{n} \sum_{d|n} \phi(n/d) |\mathfrak{A}|^{d} \qquad (\text{here, we have substituted } n/d \text{ for } d \text{ in the sum}) \\
&= \frac{1}{n} \sum_{e|n} \underbrace{\phi(n/e)}_{\substack{=\sum_{d|n/e}\mu(d)\frac{n/e}{d} \\ (\text{by } (13.147.12)\text{, applied to } n/e \\ \text{instead of } n)}} |\mathfrak{A}|^{e} \\
&\qquad (\text{here, we have renamed the summation index } d \text{ as } e) \\
&= \frac{1}{n} \sum_{e|n} \left(\sum_{d|n/e} \mu(d) \frac{n/e}{d} \right) |\mathfrak{A}|^{e} = \frac{1}{n} \sum_{e|n} \sum_{d|n/e} \mu(d) \frac{n/e}{d} |\mathfrak{A}|^{e} = \frac{1}{n} \sum_{e|n} \sum_{d|n/e} \mu(d) \frac{n}{de} |\mathfrak{A}|^{e} \\
&= \sum_{e|n} \sum_{d|n/e} \frac{1}{de} \mu(d) |\mathfrak{A}|^{e}.
\end{aligned}$$

Compared with (13.147.11), this yields

$$(\text{the number of all } n\text{-necklaces}) = \frac{1}{n} \sum_{d|n} \phi(d) |\mathfrak{A}|^{n/d}.$$

This solves Exercise 6.1.34(g).

(h) *Alternative solution of Exercise 6.1.29:* Let n be a positive integer. Exercise 6.1.34(e) yields that the aperiodic n-necklaces are in bijection with Lyndon words of length n. Hence,

$$(\text{the number of all aperiodic } n\text{-necklaces}) = (\text{the number of all Lyndon words of length } n)\,,$$

so that

$$\begin{aligned}&(\text{the number of all Lyndon words of length } n)\\ &= (\text{the number of all aperiodic } n\text{-necklaces}) = \frac{1}{n}\sum_{d\mid n}\mu\left(d\right)\left|\mathfrak{A}\right|^{n/d}\end{aligned}$$

(by Exercise 6.1.34(f)). Thus,

$$(\text{the number of all Lyndon words of length } n) = \frac{1}{n}\sum_{d\mid n}\mu\left(d\right)\underbrace{\left|\mathfrak{A}\right|^{n/d}}_{\substack{=q^{n/d}\\ (\text{since } |\mathfrak{A}|=q)}} = \frac{1}{n}\sum_{d\mid n}\mu\left(d\right)q^{n/d}.$$

This solves Exercise 6.1.29 again. Thus, Exercise 6.1.34(h) is solved.

(i) *First solution of Exercise 6.1.34(i):* Let $q\in\mathbb{Z}$. We need to show that $n \mid \sum_{d\mid n}\mu\left(d\right)q^{n/d}$ and $n \mid \sum_{d\mid n}\phi\left(d\right)q^{n/d}$.

Let r be the remainder of q modulo n. Then, $r\in\{0,1,\ldots,n-1\}\subset\mathbb{N}$. Fix a finite totally ordered set $\mathfrak{A}$ containing r elements. (Such an $\mathfrak{A}$ exists, since $r\in\mathbb{N}$. For example, we can set $\mathfrak{A}=\{1,2,\ldots,r\}$.) Exercise 6.1.34(f) shows that the number of all aperiodic n-necklaces is $\dfrac{1}{n}\sum_{d\mid n}\mu\left(d\right)\left|\mathfrak{A}\right|^{n/d}$. Hence, $\dfrac{1}{n}\sum_{d\mid n}\mu\left(d\right)\left|\mathfrak{A}\right|^{n/d}$ is an integer (since the number of all aperiodic n-necklaces is an integer). In other words, $n\mid\sum_{d\mid n}\mu\left(d\right)\left|\mathfrak{A}\right|^{n/d}$, so that $\sum_{d\mid n}\mu\left(d\right)\left|\mathfrak{A}\right|^{n/d}\equiv 0\mod n$. But r is the remainder of q modulo n. Thus, $r\equiv q\mod n$, so that $q\equiv r=\left|\mathfrak{A}\right|\mod n$ (since the set $\mathfrak{A}$ has r elements). Now, $\sum_{d\mid n}\mu\left(d\right)\underbrace{q^{n/d}}_{\substack{\equiv|\mathfrak{A}|^{n/d}\mod n\\ (\text{since } q\equiv|\mathfrak{A}|\mod n)}}\equiv\sum_{d\mid n}\mu\left(d\right)\left|\mathfrak{A}\right|^{n/d}\equiv 0\mod n$, so that $n\mid\sum_{d\mid n}\mu\left(d\right)q^{n/d}$.

Also, Exercise 6.1.34(g) shows that the number of all n-necklaces is $\dfrac{1}{n}\sum_{d\mid n}\phi\left(d\right)\left|\mathfrak{A}\right|^{n/d}$. Hence, $\dfrac{1}{n}\sum_{d\mid n}\phi\left(d\right)\left|\mathfrak{A}\right|^{n/d}$ is an integer (since the number of all n-necklaces is an integer). In other words, $n\mid\sum_{d\mid n}\phi\left(d\right)\left|\mathfrak{A}\right|^{n/d}$, so that $\sum_{d\mid n}\phi\left(d\right)\left|\mathfrak{A}\right|^{n/d}\equiv 0\mod n$. Now, $\sum_{d\mid n}\phi\left(d\right)\underbrace{q^{n/d}}_{\substack{\equiv|\mathfrak{A}|^{n/d}\mod n\\ (\text{since } q\equiv|\mathfrak{A}|\mod n)}}\equiv\sum_{d\mid n}\phi\left(d\right)\left|\mathfrak{A}\right|^{n/d}\equiv 0\mod n$, so that $n\mid\sum_{d\mid n}\phi\left(d\right)q^{n/d}$. The solution of Exercise 6.1.34(i) is thus complete.

Second solution of Exercise 6.1.34(i): Forget that we fixed n. Let $q\in\mathbb{Z}$. Let A denote the ring $\mathbb{Z}$. For every $n\in\{1,2,3,\ldots\}$, let φ_n denote the identity endomorphism id of A. Exercise 2.9.8 yields (among other things) that the seven equivalent assertions $\mathcal{C}$, $\mathcal{D}$, $\mathcal{E}$, $\mathcal{F}$, $\mathcal{G}$, $\mathcal{H}$ and $\mathcal{J}$ of Exercise 2.9.6 are satisfied for the family $\left(b_n\right)_{n\geq 1}=\left(q^n\right)_{n\geq 1}$. In particular, Assertion $\mathcal{F}$ of Exercise 2.9.6 is satisfied for the family $\left(b_n\right)_{n\geq 1}=\left(q^n\right)_{n\geq 1}$. In other words, every positive integer n satisfies

$$\sum_{d\mid n}\mu\left(d\right)\varphi_d\left(q^{n/d}\right)\in n\mathbb{Z}. \tag{13.147.13}$$

Also, Assertion $\mathcal{G}$ of Exercise 2.9.6 is satisfied for the family $\left(b_n\right)_{n\geq 1}=\left(q^n\right)_{n\geq 1}$ (since the seven equivalent assertions $\mathcal{C}$, $\mathcal{D}$, $\mathcal{E}$, $\mathcal{F}$, $\mathcal{G}$, $\mathcal{H}$ and $\mathcal{J}$ of Exercise 2.9.6 are satisfied for the family $\left(b_n\right)_{n\geq 1}=\left(q^n\right)_{n\geq 1}$). In other words, every positive integer n satisfies

$$\sum_{d\mid n}\phi\left(d\right)\varphi_d\left(q^{n/d}\right)\in n\mathbb{Z}. \tag{13.147.14}$$

Now, fix a positive integer n. We can rewrite (13.147.13) as $n \mid \sum_{d\mid n} \mu(d) \varphi_d\left(q^{n/d}\right)$. Since

$$\sum_{d\mid n} \mu(d) \underbrace{\varphi_d}_{=\mathrm{id}} \left(q^{n/d}\right) = \sum_{d\mid n} \mu(d) q^{n/d},$$

this simplifies to $n \mid \sum_{d\mid n} \mu(d) q^{n/d}$. Also, we can rewrite (13.147.14) as $n \mid \sum_{d\mid n} \phi(d) \varphi_d\left(q^{n/d}\right)$. Since

$$\sum_{d\mid n} \phi(d) \underbrace{\varphi_d}_{=\mathrm{id}} \left(q^{n/d}\right) = \sum_{d\mid n} \phi(d) q^{n/d},$$

this simplifies to $n \mid \sum_{d\mid n} \phi(d) q^{n/d}$. Exercise 6.1.34(i) is thus solved again.

13.148. **Solution to Exercise 6.1.35.** *Solution to Exercise 6.1.35.* There exists a $u \in \mathfrak{A}^*$ such that $w = uv$ (since v is a suffix of w). Consider this u.

The word v is Lyndon and thus nonempty. Hence, $\ell(v) > 0$.

The exercise asks us to prove the logical equivalence

$$(t \text{ is the longest Lyndon suffix of } wt) \iff (\text{we do not have } v < t). \qquad (13.148.1)$$

We shall prove the $\Longrightarrow$ and $\Longleftarrow$ parts of this equivalence separately:

$\Longrightarrow$: Assume that t is the longest Lyndon suffix of wt. We need to prove that we do not have $v < t$.

Assume the contrary. Thus, $v < t$. Now, both v and t are Lyndon words. Hence, Proposition 6.1.16(a) (applied to v and t instead of u and v) yields that the word vt is Lyndon. But vt is a suffix of wt (since v is a suffix of w). Hence, vt is a Lyndon suffix of wt. This Lyndon suffix is clearly longer than t (since $\ell(vt) = \underbrace{\ell(v)}_{>0} + \ell(t) > \ell(t)$), which flies in the face of the fact that t is the longest Lyndon suffix of wt. This contradiction shows that our assumption was wrong. Hence, we have proven that we do not have $v < t$. This proves the $\Longrightarrow$ part of the equivalence (13.148.1).

$\Longleftarrow$: Assume that we do not have $v < t$. We must show that t is the longest Lyndon suffix of wt.

Assume the contrary. Then, t is not the longest Lyndon suffix of wt. Since t is a Lyndon suffix of wt, this means that there exists a Lyndon suffix r of wt which satisfies $\ell(r) > \ell(t)$. Let q be the shortest such suffix.

Thus, q is a Lyndon suffix of wt and satisfies $\ell(q) > \ell(t)$. Moreover, q is the shortest such Lyndon suffix. Hence, if r is a Lyndon suffix of wt which satisfies $\ell(r) > \ell(t)$, then

$$\ell(r) \geq \ell(q). \qquad (13.148.2)$$

Both q and t are suffixes of wt, and the suffix q begins earlier (since $\ell(q) > \ell(t)$). Thus, there exists a nonempty suffix g of w such that $q = gt$. Consider this g.

The word t is nonempty (since it is Lyndon) and a suffix of q (since $q = gt$). Thus, Corollary 6.1.15 (applied to q and t instead of w and v) yields $t \geq q$ (since q is Lyndon).

The word t is Lyndon (by assumption) and a proper suffix of q (since $q = gt$ and since g is nonempty). In other words, t is a Lyndon proper suffix[1036] of q. Moreover, the word t is the longest Lyndon proper suffix of q [1037]. In other words, the word t is the longest proper suffix of q such that t is Lyndon. Also, $\ell(q) > \ell(t) \geq 1$ (since t is nonempty). Thus, q is a Lyndon word of length > 1. Hence, Exercise 6.1.31(a) (applied to q, g and t instead of w, u and v) shows that the words g and t are Lyndon. In particular, g is a Lyndon suffix of w (since g is Lyndon and a suffix of w). Since v is the longest Lyndon suffix of w, this shows that g is at most as long as v. In other words, $\ell(g) \leq \ell(v)$.

Since t is nonempty, we have $g < gt$.

[1036] Of course, a Lyndon proper suffix of q just means a proper suffix z of q such that z is Lyndon.

[1037] *Proof.* Let r be a Lyndon proper suffix of q. We shall prove that $\ell(r) \leq \ell(t)$.

Indeed, assume the contrary (for the sake of contradiction). Thus, $\ell(r) > \ell(t)$. Now, since r is a suffix of q, and since q (in turn) is a suffix of wt, we see that r is a suffix of wt. Thus, r is a Lyndon suffix of wt (since r is Lyndon). Thus, (13.148.2) shows that $\ell(r) \geq \ell(q)$. But since r is a proper suffix of q, we have $\ell(r) < \ell(q)$. This contradicts $\ell(r) \geq \ell(q)$. This contradiction proves that our assumption was wrong. Hence, we have shown that $\ell(r) \leq \ell(t)$.

Now, let us forget that we fixed r. We thus have shown that any Lyndon proper suffix r of q satisfies $\ell(r) \leq \ell(t)$. In other words, any Lyndon proper suffix of q is at most as long as t. Since t is a Lyndon proper suffix of q, this shows that the word t is the **longest** Lyndon proper suffix of q. Qed.

Both g and v are suffixes of w, and the suffix g begins no earlier than v (since $\ell(g) \leq \ell(v)$). Therefore, g is a suffix of v. Hence, Corollary 6.1.15 (applied to v and g instead of w and v) yields $g \geq v$. Hence, $v \leq g < gt = q \leq t$ (since $t \geq q$). This contradicts the fact that we do not have $v < t$. Thus, we have obtained a contradiction. Our assumption was therefore wrong, and we have shown that t is the longest Lyndon suffix of wt. This proves the $\Longleftarrow$ part of the equivalence (13.148.1).

We have now proven both parts of the equivalence (13.148.1), and thus solved Exercise 6.1.35.

[*Remark:* Exercise 6.1.35 still holds in the partial-order setting[1038]. In fact, the solution we have given above still applies in this setting.]

13.149. **Solution to Exercise 6.1.36.** *Solution to Exercise 6.1.36.* Let a be the first letter of the word w. (This is well-defined, since w has length $> 1 > 0$.) We consider a as a one-letter word; thus, $\ell(a) = 1$. Clearly, a is a prefix of w (since a is the first letter of w). Hence, there exists a word w' such that $w = aw'$. Consider this w'. The word w' is nonempty (since w has length > 1).

Now, if h is any word, then

$$\text{the suffixes of } h \text{ are precisely the proper suffixes of } ah \tag{13.149.1}$$

(since a is a single letter). Applying this to $h = w'$, we see that the suffixes of w' are precisely the proper suffixes of aw'. In other words, the suffixes of w' are precisely the proper suffixes of w (since $aw' = w$). Thus, v is the longest Lyndon suffix of w' (since v is the longest Lyndon proper suffix of w).

On the other hand, applying (13.149.1) to $h = w't$, we see that the suffixes of $w't$ are precisely the proper suffixes of $aw't$. In other words, the suffixes of $w't$ are precisely the proper suffixes of wt (since $aw' = w$).

But Exercise 6.1.35 (applied to w' instead of w) shows that

$$(t \text{ is the longest Lyndon suffix of } w't \text{ if and only if we do not have } v < t).$$

Since the suffixes of $w't$ are precisely the proper suffixes of wt, this result rewrites as follows:

$$(t \text{ is the longest Lyndon proper suffix of } wt \text{ if and only if we do not have } v < t).$$

This solves Exercise 6.1.36.

[*Remark:* Exercise 6.1.36 still holds in the partial-order setting[1039]. In fact, the solution we have given above still applies in this setting.]

13.150. **Solution to Exercise 6.1.39.** *Solution to Exercise 6.1.39.* Recall the definition of $\operatorname{stf} w$. It says that $\operatorname{stf} w = (u, v)$, where u and v are defined as follows:

- The word v is defined as the longest proper suffix of w such that v is Lyndon.
- The word u is defined as the nonempty word such that $w = uv$.

Consider these u and v. Thus, $(u, v) = \operatorname{stf} w = (g, h)$. In other words, $u = g$ and $v = h$.

We know that v is the longest proper suffix of w such that v is Lyndon. In other words, v is the longest Lyndon proper suffix of w. In other words, h is the longest Lyndon proper suffix of w (since $v = h$). This solves Exercise 6.1.39(a).

We have $w = \underbrace{u}_{=g}\underbrace{v}_{=h} = gh$. This solves Exercise 6.1.39(b).

From Exercise 6.1.31(b), we conclude that $u < w < v$. Since $u = g$, $w = gh$ and $v = h$, this rewrites as $g < gh < h$. This solves Exercise 6.1.39(c).

From Exercise 6.1.31(a), we conclude that the words u and v are Lyndon. Thus, the word u is Lyndon. In other words, the word g is Lyndon (since $u = g$). This solves solves Exercise 6.1.39(d).

The word v is the longest proper suffix of w such that v is Lyndon. In particular, the word v is Lyndon. In other words, $v \in \mathfrak{L}$.

We have $g \in \mathfrak{L}$ (since the word g is Lyndon) and $h = v \in \mathfrak{L}$. Also, the word g is nonempty (since g is Lyndon), and thus we have $\ell(g) \geq 1$. Furthermore, the word h is Lyndon (since $h \in \mathfrak{L}$) and thus nonempty.

[1038] See Exercise 6.1.33 for an explanation of what the partial-order setting is.

[1039] See Exercise 6.1.33 for an explanation of what the partial-order setting is.

Hence, $\ell(h) \geq 1$. Now, $\ell\left(\underbrace{w}_{=gh}\right) = \ell(gh) = \ell(g) + \underbrace{\ell(h)}_{\geq 1} \geq \ell(g) + 1 > \ell(g)$, so that $\ell(g) < \ell(w)$. Also, $\ell\left(\underbrace{w}_{=gh}\right) = \ell(gh) = \underbrace{\ell(g)}_{\geq 1} + \ell(h) \geq 1 + \ell(h) > \ell(h)$, so that $\ell(g) < \ell(w)$. Thus, Exercise 6.1.39(e) is solved.

(f) Exercise 6.1.36 (applied to $v = h$) shows that t is the longest Lyndon proper suffix of wt if and only if we do not have $h < t$ (since h is the longest Lyndon proper suffix of w). This solves Exercise 6.1.39(f).

13.151. **Solution to Exercise 6.1.40.** *Solution to Exercise 6.1.40.* We define a binary relation $\sim$ on the set $\mathfrak{A}^*$ as follows: If w and w' are two words, then we write $w \sim w'$ if and only if w' is a permutation of the word w (that is, if and only if there exists a permutation $\sigma \in \mathfrak{S}_k$ satisfying $w' = \left(w_{\sigma(1)}, w_{\sigma(2)}, \ldots, w_{\sigma(k)}\right)$, where $k = \ell(w)$). We notice the following properties of the relation $\sim$:

- The relation $\sim$ is an equivalence relation; in other words, it is reflexive, symmetric and transitive.
- If w and w' are two words satisfying $w \sim w'$, then $\ell(w) = \ell(w')$.
- If u, v, u' and v' are four words satisfying $u \sim u'$ and $v \sim v'$, then $uv \sim u'v'$. We shall refer to this fact as the *monoidality* of the relation $\sim$.
- If u and v are any two words, then $uv \sim vu$.

We also recall a fundamental property of Lie algebras (one of the forms of the Jacobi identity):

- Every three elements x, y and z of a Lie algebra $\mathfrak{k}$ satisfy

$$[[x,y],z] = [[x,z],y] - [[y,z],x]. \qquad (13.151.1)$$

We can now finally come to the solution of Exercise 6.1.40.

For every $h \in \mathfrak{A}^*$ and $s \in \mathfrak{A}^*$, we define a subset $\mathfrak{L}_{h,s}$ of $\mathfrak{L}$ by

$$\mathfrak{L}_{h,s} = \{w \in \mathfrak{L} \mid w \sim h \text{ and } w < s\}.$$

For every $h \in \mathfrak{A}^*$ and $s \in \mathfrak{A}^*$, we define a $\mathbf{k}$-submodule $B_{h,s}$ of B by

$$B_{h,s} = \sum_{w \in \mathfrak{L}_{h,s}} \mathbf{k} b_w.$$

(In other words, for every $h \in \mathfrak{A}^*$ and $s \in \mathfrak{A}^*$, we define $B_{h,s}$ as the $\mathbf{k}$-linear span of the elements b_w with $w \in \mathfrak{L}_{h,s}$.) If h, s, g and t are four words satisfying $h \sim g$ and $s < t$, then

$$B_{h,s} \subset B_{g,t} \qquad (13.151.2)$$

[1040].

(a) We claim that

$$[b_p, b_q] \in B_{pq,q} \qquad \text{for every } (p,q) \in \mathfrak{L} \times \mathfrak{L} \text{ satisfying } p < q. \qquad (13.151.3)$$

Proof of (13.151.3): We can WLOG assume that the alphabet $\mathfrak{A}$ is finite[1041]. Assume this.

[1040] *Proof of (13.151.2):* Let h, s, g and t be four words satisfying $h \sim g$ and $s < t$.

Let $v \in \mathfrak{L}_{h,s}$. Thus, $v \in \mathfrak{L}_{h,s} = \{w \in \mathfrak{L} \mid w \sim h \text{ and } w < s\}$ (by the definition of $\mathfrak{L}_{h,s}$). In other words, v is an element of $\mathfrak{L}$ and satisfies $v \sim h$ and $v < s$. From $v \sim h$ and $h \sim g$, we obtain $v \sim g$ (since the relation $\sim$ is transitive). Also, $v < s < t$. Thus, v is an element of $\mathfrak{L}$ and satisfies $v \sim g$ and $v < t$. In other words, $v \in \{w \in \mathfrak{L} \mid w \sim g \text{ and } w < t\} = \mathfrak{L}_{g,t}$ (since $\mathfrak{L}_{g,t}$ is defined to be $\{w \in \mathfrak{L} \mid w \sim g \text{ and } w < t\}$).

Now, let us forget that we fixed v. We thus have proven that every $v \in \mathfrak{L}_{h,s}$ satisfies $v \in \mathfrak{L}_{g,t}$. In other words, $\mathfrak{L}_{h,s} \subset \mathfrak{L}_{g,t}$. Now, the definition of $B_{h,s}$ yields $B_{h,s} = \sum_{w \in \mathfrak{L}_{h,s}} \mathbf{k} b_w \subset \sum_{w \in \mathfrak{L}_{g,t}} \mathbf{k} b_w$ (since $\mathfrak{L}_{h,s} \subset \mathfrak{L}_{g,t}$). Since $B_{g,t} = \sum_{w \in \mathfrak{L}_{g,t}} \mathbf{k} b_w$ (by the definition of $B_{g,t}$), this rewrites as $B_{h,s} \subset B_{g,t}$. This proves (13.151.2).

[1041] In fact, assume that (13.151.3) is proven in the case when the alphabet $\mathfrak{A}$ is finite. Now, let $\mathfrak{A}$ be arbitrary. We must prove (13.151.3) for this $\mathfrak{A}$.

Fix $(p,q) \in \mathfrak{L} \times \mathfrak{L}$ satisfying $p < q$. We need to prove that $[b_p, b_q] \in B_{pq,q}$. Let $\mathfrak{B}$ denote the set of all letters that appear in (at least) one of the words p and q. Then, $\mathfrak{B}$ is a finite subset of $\mathfrak{A}$, and the words p and q belong to $\mathfrak{B}^*$.

Let $\mathfrak{L}'$ denote the set of all Lyndon words over the alphabet $\mathfrak{B}$. Clearly, a word $w \in \mathfrak{B}^*$ is Lyndon as a word over the alphabet $\mathfrak{B}$ if and only if it is Lyndon as a word over the alphabet $\mathfrak{A}$. Thus, $\mathfrak{L}' = \mathfrak{L} \cap \mathfrak{B}^*$, so that p and q belong to $\mathfrak{L}'$. Also, for every given $w \in \mathfrak{L}'$ of length > 1, the pair $\operatorname{stf} w$ does not depend on whether w is considered as a Lyndon word over the

We shall prove (13.151.3) by strong induction over $\ell(pq)$:

Induction step: Let N be a nonnegative integer. Assume that (13.151.3) holds in the case when $\ell(pq) < N$. We need to prove that (13.151.3) holds in the case when $\ell(pq) = N$.

We have assumed that (13.151.3) holds in the case when $\ell(pq) < N$. In other words, we have

$$[b_p, b_q] \in B_{pq,q} \qquad \text{for every } (p,q) \in \mathfrak{L} \times \mathfrak{L} \text{ satisfying } p < q \text{ and } \ell(pq) < N. \tag{13.151.4}$$

We now must prove that (13.151.3) holds in the case when $\ell(pq) = N$. In other words, we must prove that

$$[b_p, b_q] \in B_{pq,q} \qquad \text{for every } (p,q) \in \mathfrak{L} \times \mathfrak{L} \text{ satisfying } p < q \text{ and } \ell(pq) = N. \tag{13.151.5}$$

Let $\mathfrak{G}$ be the set $\bigcup_{i=0}^{N} \mathfrak{A}^i$. This set $\mathfrak{G}$ is finite (since the set $\mathfrak{A}$ is finite) and totally ordered (by the lexicographic order). Thus, for every $w \in \mathfrak{G}$, we can define a nonnegative integer $\rho(w)$ by

$$\rho(w) = |\{g \in \mathfrak{G} \mid g < w\}|.$$

In other words, for every $w \in \mathfrak{G}$, we define $\rho(w)$ to be the number of all $g \in \mathfrak{G}$ which are smaller than w. It is clear that if w and w' are two elements of $\mathfrak{G}$ satisfying $w < w'$, then

$$\rho(w) < \rho(w') \tag{13.151.6}$$

[1042].

For every $(p,q) \in \mathfrak{L} \times \mathfrak{L}$ satisfying $p < q$ and $\ell(pq) = N$, we have $q \in \mathfrak{G}$ [1043], and thus $\rho(q)$ is well-defined. We are thus going to prove (13.151.5) by strong induction over $\rho(q)$ [1044]:

Induction step: Let K be a nonnegative integer. Assume that (13.151.5) holds in the case when $\rho(q) < K$. We need to prove that (13.151.5) holds in the case when $\rho(q) = K$.

We have assumed that (13.151.5) holds in the case when $\rho(q) < K$. In other words, we have

$$[b_p, b_q] \in B_{pq,q} \qquad \text{for every } (p,q) \in \mathfrak{L} \times \mathfrak{L} \text{ satisfying } p < q \text{ and } \ell(pq) = N \text{ and } \rho(q) < K. \tag{13.151.7}$$

Now, let $(p,q) \in \mathfrak{L} \times \mathfrak{L}$ be such that $p < q$ and $\ell(pq) = N$ and $\rho(q) = K$. We are going to prove that $[b_p, b_q] \in B_{pq,q}$.

We have $(p,q) \in \mathfrak{L} \times \mathfrak{L}$. In other words, the words p and q are Lyndon. Proposition 6.1.16(a) (applied to $u = p$ and $v = q$) thus shows that the word pq is Lyndon. In other words, $pq \in \mathfrak{L}$.

Furthermore, Proposition 6.1.16(b) (applied to $u = p$ and $v = q$) shows that $pq < q$.

The definition of $\mathfrak{L}_{pq,q}$ yields $\mathfrak{L}_{pq,q} = \{w \in \mathfrak{L} \mid w \sim pq \text{ and } w < q\}$. The definition of $B_{pq,q}$ yields $B_{pq,q} = \sum_{w \in \mathfrak{L}_{pq,q}} \mathbf{k} b_w$.

The words p and q are nonempty (since they are Lyndon), and thus have length ≥ 1 each. Hence, the word pq has length $\geq 1 + 1 > 1$. Hence, pq is a Lyndon word of length > 1 (since pq is Lyndon and since pq has length $\ell(pq) > 1$). Therefore, $\operatorname{stf}(pq)$ is well-defined. If $\operatorname{stf}(pq) = (p,q)$, then it is easy to see that

alphabet $\mathfrak{A}$ or as a Lyndon word over the alphabet $\mathfrak{B}$ (because the definition of $\operatorname{stf} w$ involves only suffixes of w, and all of these suffixes belong to $\mathfrak{B}^*$).

For every $h \in \mathfrak{B}^*$ and $s \in \mathfrak{B}^*$, let us define the set $\mathfrak{L}'_{h,s}$, the $\mathbf{k}$-module B' and the $\mathbf{k}$-module $B'_{h,s}$ in the same way as we have defined the set $\mathfrak{L}_{h,s}$, the $\mathbf{k}$-module B and the $\mathbf{k}$-module $B_{h,s}$, but using the alphabet $\mathfrak{B}$ instead of $\mathfrak{A}$. (Thus, $\mathfrak{L}'_{h,s} = \{w \in \mathfrak{L}' \mid w \sim h \text{ and } w < s\}$, $B' = \left(\text{the } \mathbf{k}\text{-submodule of } \mathfrak{g} \text{ spanned by the family } (b_w)_{w \in \mathfrak{L}'}\right)$ and $B'_{h,s} = \sum_{w \in \mathfrak{L}'_{h,s}} \mathbf{k} b_w$.)

Now, whenever w is a Lyndon word over $\mathfrak{B}$ of length > 1, we must have $w \in \mathfrak{L}' = \mathfrak{L} \cap \mathfrak{B}^* \subset \mathfrak{L}$ and thus $b_w = [b_u, b_v]$, where $(u,v) = \operatorname{stf} w$ (according to (6.1.2)). Here, when we speak of $\operatorname{stf} w$, we are regarding w as a Lyndon word over $\mathfrak{A}$, but as we have already explained, the result is the same if we regard w as a Lyndon word over $\mathfrak{B}$ instead. Thus, we can apply (13.151.3) to $\mathfrak{B}$ and $\mathfrak{L}'$ instead of $\mathfrak{A}$ and $\mathfrak{L}$ (since we assumed that (13.151.3) is proven in the case when the alphabet $\mathfrak{A}$ is finite), and obtain $[b_p, b_q] \in B'_{pq,q}$.

But we have $\mathfrak{L}' = \mathfrak{L} \cap \mathfrak{B}^* \subset \mathfrak{L}$, thus $\mathfrak{L}'_{pq,q} \subset \mathfrak{L}_{pq,q}$ and therefore $B'_{pq,q} \subset B_{pq,q}$ (actually, a little thought shows that $B'_{pq,q} = B_{pq,q}$), so that we have $[b_p, b_q] \in B'_{pq,q} \subset B_{pq,q}$, and thus (13.151.3) is proven.

[1042] *Proof.* Let w and w' be two elements of $\mathfrak{G}$ satisfying $w < w'$. Then, $\{g \in \mathfrak{G} \mid g < w\}$ is a proper subset of $\{g \in \mathfrak{G} \mid g < w'\}$ (proper because w belongs to the latter set but not to the former set). Hence, $|\{g \in \mathfrak{G} \mid g < w\}| < |\{g \in \mathfrak{G} \mid g < w'\}|$. Since $\rho(w) = |\{g \in \mathfrak{G} \mid g < w\}|$ and $\rho(w') = |\{g \in \mathfrak{G} \mid g < w'\}|$ (similarly), this rewrites as $\rho(w) < \rho(w')$, qed.

[1043] *Proof.* Let $(p,q) \in \mathfrak{L} \times \mathfrak{L}$ be such that $p < q$ and $\ell(pq) = N$. Then, $N = \ell(pq) = \underbrace{\ell(p)}_{\geq 0} + \ell(q) \geq \ell(q)$, so that $\ell(q) \leq N$ and thus $q \in \bigcup_{i=0}^{N} \mathfrak{A}^i = \mathfrak{G}$, qed.

[1044] Of course, this will be an induction within our current induction step, so the reader should try not to confuse the two inductions going on.

$[b_p, b_q] \in B_{pq,q}$ [1045]. Hence, for the rest of the proof of $[b_p, b_q] \in B_{pq,q}$, we WLOG assume that we don't have $\operatorname{stf}(pq) = (p, q)$. Thus, q is not the longest Lyndon proper suffix of pq [1046]. In other words, the statement that q is the longest Lyndon proper suffix of pq is **false**.

We have $\ell(p) > 1$ [1047]. Thus, p is a Lyndon word of length > 1 (since p is Lyndon and since p has length $\ell(p) > 1$). Therefore, $\operatorname{stf} p$ is well-defined. Set $(u, v) = \operatorname{stf} p$. Then, Exercise 6.1.39(a) (applied to $w = p$, $g = u$ and $h = v$) says that v is the longest Lyndon proper suffix of p. In particular, v is a Lyndon proper suffix of p. Moreover, Exercise 6.1.39(b) (applied to $w = p$, $g = u$ and $h = v$) says that we have $p = uv$. Also, Exercise 6.1.39(c) (applied to $w = p$, $g = u$ and $h = v$) says that we have $u < uv < v$. Finally, Exercise 6.1.39(d) (applied to $w = p$, $g = u$ and $h = v$) says that the word u is Lyndon. In other words, $u \in \mathfrak{L}$. The words u and v are nonempty (since they are Lyndon).

Exercise 6.1.36 (applied to $w = p$ and $t = q$) now shows that q is the longest Lyndon proper suffix of pq if and only if we do not have $v < q$. Thus, the statement that we do not have $v < q$ is **false** (because the statement that q is the longest Lyndon proper suffix of pq is **false**). Thus, we have $v < q$. Thus, $u < v < q$.

Recall that $(u, v) = \operatorname{stf} p$. Thus, (6.1.2) (applied to $w = p$) shows that $b_p = [b_u, b_v]$. Thus,

$$\left[\underbrace{b_p}_{=[b_u,b_v]}, b_q\right] = [[b_u, b_v], b_q] = [[b_u, b_q], b_v] - [[b_v, b_q], b_u] \tag{13.151.8}$$

(by (13.151.1), applied to $\mathfrak{k} = \mathfrak{g}$, $x = b_u$, $y = b_v$ and $z = b_q$).

Now,

$$[b_u, b_q] \in B_{uq,q} \tag{13.151.9}$$

[1048] and

$$[b_v, b_q] \in B_{vq,q} \tag{13.151.10}$$

[1045] *Proof.* Assume that $\operatorname{stf}(pq) = (p, q)$. Thus, (6.1.2) (applied to $w = pq$, $u = p$ and $v = q$) shows that $b_{pq} = [b_p, b_q]$. But pq is an element of $\mathfrak{L}$ and satisfies $pq \sim pq$ (since the relation $\sim$ is reflexive) and $pq < q$. In other words, $pq \in \{w \in \mathfrak{L} \mid w \sim pq \text{ and } w < q\} = \mathfrak{L}_{pq,q}$. Thus, $\mathbf{k} b_{pq} \subset \sum_{w \in \mathfrak{L}_{pq,q}} \mathbf{k} b_w$.

Now, from $b_{pq} = [b_p, b_q]$, we obtain

$$[b_p, b_q] = b_{pq} \in \mathbf{k} b_{pq} \subset \sum_{w \in \mathfrak{L}_{pq,q}} \mathbf{k} b_w = B_{pq,q}$$

(since $B_{pq,q} = \sum_{w \in \mathfrak{L}_{pq,q}} \mathbf{k} b_w$), qed.

[1046] *Proof.* Assume the contrary. Thus, q is the longest Lyndon proper suffix of pq.

Let $w = pq$. Recall that q is the longest Lyndon proper suffix of pq. In other words, q is the longest Lyndon proper suffix of w (since $w = pq$).

Let $(g, h) = \operatorname{stf}(pq)$. Then, $(g, h) = \operatorname{stf}\left(\underbrace{pq}_{=w}\right) = \operatorname{stf} w$. Thus, h is the longest Lyndon proper suffix of w (by Exercise 6.1.39(a)). Comparing this with the fact that q is the longest Lyndon proper suffix of w, we obtain that $h = q$.

But Exercise 6.1.39(b) shows that $w = g \underbrace{h}_{=q} = gq$. Thus, $gq = w = pq$. Cancelling q from this equality, we obtain $g = p$. Now, from $(g, h) = \operatorname{stf}(pq)$, we obtain $\operatorname{stf}(pq) = \left(\underbrace{g}_{=p}, \underbrace{h}_{=q}\right) = (p, q)$. This contradicts the fact that we don't have $\operatorname{stf}(pq) = (p, q)$. This contradiction proves that our assumption was wrong, qed.

[1047] *Proof.* Assume the contrary. Thus, $\ell(p) \leq 1$. Since p is nonempty, this shows that $\ell(p) = 1$. Therefore, q is the longest proper suffix of pq. Thus, q is the longest Lyndon proper suffix of pq (since q is Lyndon). This contradicts the fact that q is not the longest Lyndon proper suffix of pq. This contradiction shows that our assumption was wrong, qed.

[1048] *Proof of (13.151.9):* We have $(u, q) \in \mathfrak{L} \times \mathfrak{L}$ (since $u \in \mathfrak{L}$ and $q \in \mathfrak{L}$) and $u < q$. Also, $\ell\left(\underbrace{p}_{=uv}\right) = \ell(uv) = \ell(u) + \underbrace{\ell(v)}_{\substack{>0 \\ (\text{since } v \text{ is nonempty})}} > \ell(u)$. But $\ell(pq) = N$, so that $N = \ell(pq) = \underbrace{\ell(p)}_{>\ell(u)} + \ell(q) > \ell(u) + \ell(q) = \ell(uq)$. Thus, $\ell(uq) < N$. Therefore, (13.151.4) (applied to (u, q) instead of (p, q)) yields $[b_u, b_q] \in B_{uq,q}$. This proves (13.151.9).

[1049]. Hence, (13.151.8) becomes

$$[b_p, b_q] = \left[\underbrace{[b_u, b_q]}_{\substack{\in B_{uq,q} \\ \text{(by (13.151.9))}}}, b_v \right] - \left[\underbrace{[b_v, b_q]}_{\substack{\in B_{vq,q} \\ \text{(by (13.151.10))}}}, b_u \right] \in [B_{uq,q}, b_v] - [B_{vq,q}, b_u] . \tag{13.151.11}$$

On the other hand, if g and h are two Lyndon words satisfying $g < q$, $h < q$ and $gh \sim p$, then

$$(\text{every } r \in \mathfrak{L}_{gq,q} \text{ satisfies } [b_r, b_h] \in B_{pq,q}) \tag{13.151.12}$$

[1050] and therefore

$$[B_{gq,q}, b_h] \subset B_{pq,q} \tag{13.151.13}$$

[1049] *Proof of (13.151.10):* We have $(v, q) \in \mathfrak{L} \times \mathfrak{L}$ (since $v \in \mathfrak{L}$ and $q \in \mathfrak{L}$) and $v < q$. Also, $\ell \left(\underbrace{p}_{=uv} \right) = \ell (uv) = \underbrace{\ell (u)}_{\substack{>0 \\ \text{(since } u \text{ is nonempty)}}} + \ell (v) > \ell (v)$. But $\ell (pq) = N$, so that $N = \ell (pq) = \underbrace{\ell (p)}_{> \ell(v)} + \ell (q) > \ell (v) + \ell (q) = \ell (vq)$. Thus, $\ell (vq) < N$. Therefore, (13.151.4) (applied to (v, q) instead of (p, q)) yields $[b_v, b_q] \in B_{vq,q}$. This proves (13.151.10).

[1050] *Proof of (13.151.12):* Let g and h be two Lyndon words satisfying $g < q$, $h < q$ and $gh \sim p$. Let $r \in \mathfrak{L}_{gq,q}$. We must prove that $[b_r, b_h] \in B_{pq,q}$.

The words g and h are Lyndon. In other words, $g \in \mathfrak{L}$ and $h \in \mathfrak{L}$.

We have $gh \sim p$ and thus $\ell (gh) = \ell (p)$. Hence, $\ell (p) = \ell (gh) = \ell (g) + \ell (h)$.

We have $gh \sim p$ and $q \sim q$ (since the relation $\sim$ is reflexive). Hence, $ghq \sim pq$ (by the monoidality of the relation $\sim$).

We have $N = \ell (pq) = \underbrace{\ell (p)}_{\geq 0} + \ell (q) \geq \ell (q)$, whence $\ell (q) \leq N$ and thus $q \in \bigcup_{i=0}^{N} \mathfrak{A}^i = \mathfrak{G}$.

We have $r \in \mathfrak{L}_{gq,q} = \{ w \in \mathfrak{L} \mid w \sim gq \text{ and } w < q \}$ (by the definition of $\mathfrak{L}_{gq,q}$). In other words, r is an element of $\mathfrak{L}$ and satisfies $r \sim gq$ and $r < q$. From $r \sim gq$, we obtain $\ell (r) = \ell (gq) = \ell (g) + \ell (q)$.

If $r = h$, then $\left[\underbrace{b_r}_{\substack{= b_h \\ \text{(since } r = h)}}, b_h \right] = [b_h, b_h] = 0 \in B_{pq,q}$ (since $B_{pq,q}$ is a $\mathbf{k}$-module). Hence, for the rest of the proof of $[b_r, b_h] \in B_{pq,q}$, we WLOG assume that we don't have $r = h$.

Thus, we have $r \neq h$. Hence, we have either $r < h$ or $r > h$ (since the lexicographic order on $\mathfrak{A}^*$ is a total order). In other words, we are in one of the following two Cases:

Case 1: We have $r < h$.

Case 2: We have $r > h$.

Let us first consider Case 1. In this case, we have $r < h$. We have $\ell (rh) = \underbrace{\ell (r)}_{= \ell(g) + \ell(q)} + \ell (h) = \ell (g) + \ell (q) + \ell (h) = \ell (g) + \ell (h) + \ell (q)$. Comparing this with $\ell (pq) = \underbrace{\ell (p)}_{= \ell(g) + \ell(h)} + \ell (q) = \ell (g) + \ell (h) + \ell (q)$, we obtain $\ell (rh) = \ell (pq) = N$.

We have $r \sim gq$ and $h \sim h$ (since the relation $\sim$ is reflexive). Thus, $rh \sim gqh$ (by the monoidality of the relation $\sim$). But $gqh \sim ghq$ (by the monoidality of the relation $\sim$ again, since $g \sim g$ and $qh \sim hq$). From $rh \sim gqh$ and $gqh \sim ghq$, we obtain $rh \sim ghq$ (since the relation $\sim$ is transitive). From $rh \sim ghq$ and $ghq \sim pq$, we obtain $rh \sim pq$ (since the relation $\sim$ is transitive). Now, (13.151.2) (applied to rh, h, pq and q instead of h, s, g and t) yields $B_{rh,h} \subset B_{pq,q}$ (since $h < q$).

On the other hand, $N = \ell (rh) = \underbrace{\ell (r)}_{\geq 0} + \ell (h) \geq \ell (h)$, whence $\ell (h) \leq N$ and thus $h \in \bigcup_{i=0}^{N} \mathfrak{A}^i = \mathfrak{G}$. Since $h < q$, we have $\rho (h) < \rho (q)$ (by (13.151.6), applied to h and q instead of w and w'), so that $\rho (h) < \rho (q) = K$.

Now, we have $(r, h) \in \mathfrak{L} \times \mathfrak{L}$ (since $r \in \mathfrak{L}$ and $h \in \mathfrak{L}$) and $r < h$ and $\ell (rh) = N$ and $\rho (h) < K$. Therefore, (13.151.7) (applied to r and h instead of p and q) shows that $[b_r, b_h] \in B_{rh,h} \subset B_{pq,q}$. Thus, $[b_r, b_h] \in B_{pq,q}$ is proven in Case 1.

Let us now consider Case 2. In this case, we have $h < r$. We have $\ell (hr) = \ell (h) + \underbrace{\ell (r)}_{= \ell(g) + \ell(q)} = \ell (h) + \ell (g) + \ell (q) = \ell (g) + \ell (h) + \ell (q)$. Comparing this with $\ell (pq) = \underbrace{\ell (p)}_{= \ell(g) + \ell(h)} + \ell (q) = \ell (g) + \ell (h) + \ell (q)$, we obtain $\ell (hr) = \ell (pq) = N$.

We have $h \sim h$ (since the relation $\sim$ is reflexive) and $r \sim gq$. Thus, $hr \sim hgq$ (by the monoidality of the relation $\sim$). But $hgq \sim ghq$ (by the monoidality of the relation $\sim$, since $hg \sim gh$ and $q \sim q$). From $hr \sim hgq$ and $hgq \sim ghq$, we obtain $hr \sim ghq$ (since the relation $\sim$ is transitive). From $hr \sim ghq$ and $ghq \sim pq$, we obtain $hr \sim pq$ (since the relation $\sim$ is transitive). Now, (13.151.2) (applied to hr, r, pq and q instead of h, s, g and t) yields $B_{hr,r} \subset B_{pq,q}$ (since $r < q$).

[1051].

We have $p \sim p$ (since the relation $\sim$ is reflexive). In other words, $uv \sim p$ (since $p = uv$). Also, $vu \sim uv$. Since $p = uv$, this rewrites as $vu \sim p$.

Now, the words u and v are Lyndon and satisfy $u < q$, $v < q$ and $uv \sim p$. Thus, we can apply (13.151.13) to $g = u$ and $h = v$. As a result, we obtain $[B_{uq,q}, b_v] \subset B_{pq,q}$.

Furthermore, the words v and u are Lyndon and satisfy $v < q$, $u < q$ and $vu \sim p$. Thus, we can apply (13.151.13) to $g = v$ and $h = u$. As a result, we obtain $[B_{vq,q}, b_u] \subset B_{pq,q}$.

Now, (13.151.11) becomes

$$[b_p, b_q] \in \underbrace{[B_{uq,q}, b_v]}_{\subset B_{pq,q}} - \underbrace{[B_{vq,q}, b_u]}_{\subset B_{pq,q}} \subset B_{pq,q} - B_{pq,q} \subset B_{pq,q}$$

(since $B_{pq,q}$ is a $\mathbf{k}$-module).

Let us now forget that we fixed (p, q). We thus have proven that

$$[b_p, b_q] \in B_{pq,q} \qquad \text{for every } (p, q) \in \mathfrak{L} \times \mathfrak{L} \text{ satisfying } p < q \text{ and } \ell(pq) = N \text{ and } \rho(q) = K.$$

In other words, (13.151.5) holds in the case when $\rho(q) = K$. This completes the induction step (in the induction proof of (13.151.5)). The induction proof of (13.151.5) is thus finished.

We thus have proven (13.151.5). In other words, (13.151.3) holds in the case when $\ell(pq) = N$. This completes the induction step (in the induction proof of (13.151.3)). The induction proof of (13.151.3) is thus complete.

Now, we recall that B is the $\mathbf{k}$-submodule of $\mathfrak{g}$ spanned by the family $(b_w)_{w \in \mathfrak{L}}$. In other words,

$$B = \sum_{w \in \mathfrak{L}} \mathbf{k} b_w. \tag{13.151.14}$$

Thus,

$$B_{h,s} \subset B \qquad \text{for every } h \in \mathfrak{A}^* \text{ and } s \in \mathfrak{A}^* \tag{13.151.15}$$

[1052].

Now, using (13.151.3), we can easily see the following fact: For any $p \in \mathfrak{L}$ and $q \in \mathfrak{L}$, we have

$$[b_p, b_q] \in B \tag{13.151.16}$$

On the other hand, $N = \ell(hr) = \underbrace{\ell(h)}_{\geq 0} + \ell(r) \geq \ell(r)$, whence $\ell(r) \leq N$ and thus $r \in \bigcup_{i=0}^{N} \mathfrak{A}^i = \mathfrak{G}$. Since $r < q$, we have $\rho(r) < \rho(q)$ (by (13.151.6), applied to r and q instead of w and w'), so that $\rho(r) < \rho(q) = K$.

Now, we have $(h, r) \in \mathfrak{L} \times \mathfrak{L}$ (since $h \in \mathfrak{L}$ and $r \in \mathfrak{L}$) and $h < r$ and $\ell(hr) = N$ and $\rho(r) < K$. Therefore, (13.151.7) (applied to h and r instead of p and q) shows that $[b_h, b_r] \in B_{hr,r} \subset B_{pq,q}$. Thus, $[b_r, b_h] = -\underbrace{[b_h, b_r]}_{\in B_{pq,q}} \in -B_{pq,q} \subset B_{pq,q}$ (since $B_{pq,q}$ is a $\mathbf{k}$-module). Hence, $[b_r, b_h] \in B_{pq,q}$ is proven in Case 2.

Thus, $[b_r, b_h] \in B_{pq,q}$ is proven in each of the two Cases 1 and 2. This completes the proof of (13.151.12).

[1051] *Proof of (13.151.13):* Let g and h be two Lyndon words satisfying $g < q$, $h < q$ and $gh \sim p$. The definition of $B_{gq,q}$ shows that $B_{gq,q} = \sum_{w \in \mathfrak{L}_{gq,q}} \mathbf{k} b_w$. In other words, $B_{gq,q}$ is the $\mathbf{k}$-linear span of the elements b_w with $w \in \mathfrak{L}_{gq,q}$. Hence, in order to prove the relation (13.151.13), it suffices to show that $[b_w, b_h] \in B_{pq,q}$ for every $w \in \mathfrak{L}_{gq,q}$. But this follows from (13.151.12) (applied to $r = w$). This proves (13.151.13).

[1052] *Proof of (13.151.15):* Let $h \in \mathfrak{A}^*$ and $s \in \mathfrak{A}^*$.

Clearly, $\mathfrak{L}_{h,s} \subset \mathfrak{L}$. Thus, $\sum_{w \in \mathfrak{L}_{h,s}} \mathbf{k} b_w \subset \sum_{w \in \mathfrak{L}} \mathbf{k} b_w$. Since $B_{h,s} = \sum_{w \in \mathfrak{L}_{h,s}} \mathbf{k} b_w$ and $B = \sum_{w \in \mathfrak{L}} \mathbf{k} b_w$ (by (13.151.14)), this rewrites as $B_{h,s} \subset B$. This proves (13.151.15).

[1053]. Now, (13.151.14) yields $B = \sum_{w\in\mathfrak{L}} \mathbf{k} b_w = \sum_{p\in\mathfrak{L}} \mathbf{k} b_p$ (here, we renamed the summation index w as p) and $B = \sum_{w\in\mathfrak{L}} \mathbf{k} b_w = \sum_{q\in\mathfrak{L}} \mathbf{k} b_q$ (here, we renamed the summation index w as q). Thus,

$$\begin{aligned}
&\left[\underbrace{B}_{=\sum_{p\in\mathfrak{L}} \mathbf{k} b_p}, \underbrace{B}_{=\sum_{q\in\mathfrak{L}} \mathbf{k} b_q}\right] \\
&= \left[\sum_{p\in\mathfrak{L}} \mathbf{k} b_p, \sum_{q\in\mathfrak{L}} \mathbf{k} b_q\right] = \sum_{p\in\mathfrak{L}} \sum_{q\in\mathfrak{L}} \underbrace{\mathbf{k}\mathbf{k}}_{\subset \mathbf{k}} \underbrace{[b_p, b_q]}_{\substack{\in B \\ \text{(by (13.151.16))}}} \qquad \text{(since the Lie bracket on } \mathfrak{g} \text{ is } \mathbf{k}\text{-bilinear)} \\
&\subset \sum_{p\in\mathfrak{L}} \sum_{q\in\mathfrak{L}} \mathbf{k} B \subset B \qquad \text{(since } B \text{ is a } \mathbf{k}\text{-module)}.
\end{aligned}$$

In other words, B is a Lie subalgebra of $\mathfrak{g}$. This solves Exercise 6.1.40(a).

(b) We shall first prove that

$$f([b_p, b_q]) = [f(b_p), f(b_q)] \qquad \text{for every } (p,q) \in \mathfrak{L}\times\mathfrak{L} \text{ satisfying } p < q. \tag{13.151.17}$$

The proof of (13.151.17) is very similar to our above proof of (13.151.3); it proceeds using the same kind of double induction, with almost the same computations. Here are the details of this proof:

Proof of (13.151.17): We can WLOG assume that the alphabet $\mathfrak{A}$ is finite[1054]. Assume this.

We shall prove (13.151.17) by strong induction over $\ell(pq)$:

Induction step: Let N be a nonnegative integer. Assume that (13.151.17) holds in the case when $\ell(pq) < N$. We need to prove that (13.151.17) holds in the case when $\ell(pq) = N$.

We have assumed that (13.151.17) holds in the case when $\ell(pq) < N$. In other words, we have

$$f([b_p, b_q]) = [f(b_p), f(b_q)] \qquad \text{for every } (p,q) \in \mathfrak{L}\times\mathfrak{L} \text{ satisfying } p < q \text{ and } \ell(pq) < N. \tag{13.151.18}$$

We now must prove that (13.151.17) holds in the case when $\ell(pq) = N$. In other words, we must prove that

$$f([b_p, b_q]) = [f(b_p), f(b_q)] \qquad \text{for every } (p,q) \in \mathfrak{L}\times\mathfrak{L} \text{ satisfying } p < q \text{ and } \ell(pq) = N. \tag{13.151.19}$$

We define a set $\mathfrak{G}$ in the same fashion as in our proof of (13.151.3). Likewise, we define a nonnegative integer $\rho(w)$ for every $w \in \mathfrak{G}$ in the same way as we did in our proof of (13.151.3).

For every $(p,q) \in \mathfrak{L}\times\mathfrak{L}$ satisfying $p < q$ and $\ell(pq) = N$, we have $q \in \mathfrak{G}$ [1055], and thus $\rho(q)$ is well-defined. We are thus going to prove (13.151.19) by strong induction over $\rho(q)$ [1056]:

[1053] *Proof of (13.151.16):* Let $p \in \mathfrak{L}$ and $q \in \mathfrak{L}$. We need to prove that $[b_p, b_q] \in B$. If $p = q$, then this is clear (because if $p = q$, then $\left[\underbrace{b_p}_{\substack{=b_q \\ (\text{since } p=q)}}, b_q\right] = [b_q, b_q] = 0 \in B$ (since B is a $\mathbf{k}$-module)). Thus, for the rest of this proof, we WLOG assume that we don't have $p = q$.

We have $(p,q) \in \mathfrak{L}\times\mathfrak{L}$ (since $p \in \mathfrak{L}$ and $q \in \mathfrak{L}$) and $(q,p) \in \mathfrak{L}\times\mathfrak{L}$ (since $q \in \mathfrak{L}$ and $p \in \mathfrak{L}$). We have $p \neq q$ (since we don't have $p = q$). Thus, we have either $p < q$ or $p > q$ (since the lexicographic order on $\mathfrak{A}^*$ is a total order). In other words, we are in one of the following two Cases:

Case 1: We have $p < q$.

Case 2: We have $p > q$.

Let us first consider Case 1. In this case, we have $p < q$. Thus, from (13.151.3), we obtain $[b_p, b_q] \in B_{pq,q} \subset B$ (by (13.151.15) (applied to $h = pq$ and $s = q$)). Thus, $[b_p, b_q] \in B$ is proven in Case 1.

Let us now consider Case 2. In this case, we have $p > q$. In other words, $q < p$. Thus, (13.151.3) (applied to (q,p) instead of (p,q)) shows that $[b_q, b_p] \in B_{qp,p} \subset B$ (by (13.151.15) (applied to $h = qp$ and $s = p$)). Now, $[b_p, b_q] = -\underbrace{[b_q, b_p]}_{\in B} \in -B \subset B$ (since B is a $\mathbf{k}$-module). Thus, $[b_p, b_q] \in B$ is proven in Case 2.

Now, $[b_p, b_q] \in B$ is proven in each of the two Cases 1 and 2. Thus, (13.151.16) is proven.

[1054] The reasons why this is legitimate are similar to the analogous reasons in the proof of (13.151.3).

[1055] This can be proven in the same way as in our proof of (13.151.3).

[1056] Of course, this will be an induction within our current induction step, so the reader should try not to confuse the two inductions going on.

Induction step: Let K be a nonnegative integer. Assume that (13.151.19) holds in the case when $\rho(q) < K$. We need to prove that (13.151.19) holds in the case when $\rho(q) = K$.

We have assumed that (13.151.19) holds in the case when $\rho(q) < K$. In other words, we have

$$f([b_p, b_q]) = [f(b_p), f(b_q)] \qquad \text{for every } (p,q) \in \mathfrak{L} \times \mathfrak{L} \text{ satisfying } p < q \text{ and } \ell(pq) = N \text{ and } \rho(q) < K. \tag{13.151.20}$$

Now, let $(p,q) \in \mathfrak{L} \times \mathfrak{L}$ be such that $p < q$ and $\ell(pq) = N$ and $\rho(q) = K$. We are going to prove that $f([b_p, b_q]) = [f(b_p), f(b_q)]$.

As in our proof of (13.151.5), we can prove the following facts:

- The words p and q are Lyndon.
- The word pq is Lyndon. In other words, $pq \in \mathfrak{L}$.
- We have $pq < q$.
- The word pq is a Lyndon word of length > 1. Therefore, $\operatorname{stf}(pq)$ is well-defined.

If $\operatorname{stf}(pq) = (p,q)$, then it is easy to see that $f([b_p, b_q]) = [f(b_p), f(b_q)]$ [1057]. Hence, for the rest of the proof of $f([b_p, b_q]) = [f(b_p), f(b_q)]$, we WLOG assume that we don't have $\operatorname{stf}(pq) = (p,q)$. As in our proof of (13.151.5), we can see that p is a Lyndon word of length > 1. Therefore, $\operatorname{stf} p$ is well-defined. Set $(u,v) = \operatorname{stf} p$.

As in our proof of (13.151.5), we can see the following facts:

- The word v is a Lyndon proper suffix of p.
- We have $p = uv$.
- We have $u < uv < v$.
- The word u is Lyndon. In other words, $u \in \mathfrak{L}$.
- The words u and v are nonempty.
- We have $u < v < q$.
- We have $b_p = [b_u, b_v]$.
- The equality (13.151.8) holds.

On the other hand, (6.1.3) (applied to $w = p$) shows that $f([b_u, b_v]) = [f(b_u), f(b_v)]$ (since p is a Lyndon word of length > 1, and since $(u,v) = \operatorname{stf} p$). Now, applying the map f to both sides of the equality $b_p = [b_u, b_v]$, we obtain

$$f(b_p) = f([b_u, b_v]) = [f(b_u), f(b_v)]. \tag{13.151.21}$$

Now,

$$f([b_u, b_q]) = [f(b_u), f(b_q)] \tag{13.151.22}$$

[1058] and

$$f([b_v, b_q]) = [f(b_v), f(b_q)] \tag{13.151.23}$$

[1059].

On the other hand, if g and h are two Lyndon words satisfying $g < q$, $h < q$ and $gh \sim p$, then

$$(\text{every } r \in \mathfrak{L}_{gq,q} \text{ satisfies } f([b_r, b_h]) = [f(b_r), f(b_h)]) \tag{13.151.24}$$

[1057] *Proof.* Assume that $\operatorname{stf}(pq) = (p,q)$. Thus, $(p,q) = \operatorname{stf}(pq)$. Hence, (6.1.3) (applied to $w = pq$, $u = p$ and $v = q$) shows that $f([b_p, b_q]) = [f(b_p), f(b_q)]$, qed.

[1058] *Proof of (13.151.22):* We have $(u,q) \in \mathfrak{L} \times \mathfrak{L}$ (since $u \in \mathfrak{L}$ and $q \in \mathfrak{L}$) and $u < q$. Also, $\ell\left(\underbrace{p}_{=uv}\right) = \ell(uv) = \ell(u) + \underbrace{\ell(v)}_{\substack{>0 \\ (\text{since } v \text{ is nonempty})}} > \ell(u)$. But $\ell(pq) = N$, so that $N = \ell(pq) = \underbrace{\ell(p)}_{>\ell(u)} + \ell(q) > \ell(u) + \ell(q) = \ell(uq)$. Thus, $\ell(uq) < N$. Therefore, (13.151.18) (applied to (u,q) instead of (p,q)) yields $f([b_u, b_q]) = [f(b_u), f(b_q)]$. This proves (13.151.22).

[1059] *Proof of (13.151.23):* We have $(v,q) \in \mathfrak{L} \times \mathfrak{L}$ (since $v \in \mathfrak{L}$ and $q \in \mathfrak{L}$) and $v < q$. Also, $\ell\left(\underbrace{p}_{=uv}\right) = \ell(uv) = \underbrace{\ell(u)}_{\substack{>0 \\ (\text{since } u \text{ is nonempty})}} + \ell(v) > \ell(v)$. But $\ell(pq) = N$, so that $N = \ell(pq) = \underbrace{\ell(p)}_{>\ell(v)} + \ell(q) > \ell(v) + \ell(q) = \ell(vq)$. Thus, $\ell(vq) < N$. Therefore, (13.151.18) (applied to (v,q) instead of (p,q)) yields $f([b_v, b_q]) = [f(b_v), f(b_q)]$. This proves (13.151.23).

[1060] and therefore

$$\text{(every } x \in B_{gq,q} \text{ satisfies } f([x, b_h]) = [f(x), f(b_h)]) \tag{13.151.25}$$

[1061].

Recall that (13.151.3) holds. (This was proven in our solution to Exercise 6.1.40(a).) Now, $(u, q) \in \mathfrak{L} \times \mathfrak{L}$ (since $u \in \mathfrak{L}$ and $q \in \mathfrak{L}$) and $u < q$. Thus, (13.151.3) (applied to (u, q) instead of (p, q)) shows that $[b_u, b_q] \in B_{uq,q}$. Also, $(v, q) \in \mathfrak{L} \times \mathfrak{L}$ (since $v \in \mathfrak{L}$ and $q \in \mathfrak{L}$) and $v < q$. Thus, (13.151.3) (applied to (v, q) instead of (p, q)) shows that $[b_v, b_q] \in B_{vq,q}$.

As in our proof of (13.151.5), we can show that $uv \sim p$ and $vu \sim p$.

Now, the words u and v are Lyndon and satisfy $u < q$, $v < q$, $uv \sim p$ and $[b_u, b_q] \in B_{uq,q}$. Thus, we can apply (13.151.25) to $g = u$, $h = v$ and $x = [b_u, b_q]$. As a result, we obtain

$$f([[b_u, b_q], b_v]) = \left[\underbrace{f([b_u, b_q])}_{\substack{=[f(b_u), f(b_q)] \\ \text{(by (13.151.22))}}}, f(b_v) \right] = [[f(b_u), f(b_q)], f(b_v)]. \tag{13.151.26}$$

Furthermore, the words v and u are Lyndon and satisfy $v < q$, $u < q$, $vu \sim p$ and $[b_v, b_q] \in B_{vq,q}$. Thus, we can apply (13.151.25) to $g = v$, $h = u$ and $x = [b_v, b_q]$. As a result, we obtain

$$f([[b_v, b_q], b_u]) = \left[\underbrace{f([b_v, b_q])}_{\substack{=[f(b_v), f(b_q)] \\ \text{(by (13.151.23))}}}, f(b_u) \right] = [[f(b_v), f(b_q)], f(b_u)]. \tag{13.151.27}$$

Now, applying the map f to both sides of the equality (13.151.8), we obtain

$$\begin{aligned} f([b_p, b_q]) &= f([[b_u, b_q], b_v] - [[b_v, b_q], b_u]) \\ &= \underbrace{f([[b_u, b_q], b_v])}_{\substack{=[[f(b_u), f(b_q)], f(b_v)] \\ \text{(by (13.151.26))}}} - \underbrace{f([[b_v, b_q], b_u])}_{\substack{=[[f(b_v), f(b_q)], f(b_u)] \\ \text{(by (13.151.27))}}} \qquad \text{(since the map } f \text{ is } \mathbf{k}\text{-linear)} \\ &= [[f(b_u), f(b_q)], f(b_v)] - [[f(b_v), f(b_q)], f(b_u)]. \end{aligned}$$

Comparing this with

$$\begin{aligned} \left[\underbrace{f(b_p)}_{\substack{=[f(b_u), f(b_v)] \\ \text{(by (13.151.21))}}}, f(b_q) \right] &= [[f(b_u), f(b_v)], f(b_q)] \\ &= [[f(b_u), f(b_q)], f(b_v)] - [[f(b_v), f(b_q)], f(b_u)]. \\ &\qquad \text{(by (13.151.1), applied to } \mathfrak{k} = \mathfrak{h},\ x = f(b_u),\ y = f(b_v) \text{ and } z = f(b_q)), \end{aligned}$$

we obtain $f([b_p, b_q]) = [f(b_p), f(b_q)]$.

Let us now forget that we fixed (p, q). We thus have proven that

$$f([b_p, b_q]) = [f(b_p), f(b_q)] \qquad \text{for every } (p, q) \in \mathfrak{L} \times \mathfrak{L} \text{ satisfying } p < q \text{ and } \ell(pq) = N \text{ and } \rho(q) = K.$$

In other words, (13.151.19) holds in the case when $\rho(q) = K$. This completes the induction step (in the induction proof of (13.151.19)). The induction proof of (13.151.19) is thus finished.

[1060] The proof of (13.151.24) can be obtained by modifying our proof of (13.151.12) in a straightforward way. (We now must use (13.151.20) instead of (13.151.7).)

[1061] *Proof of (13.151.25):* Let g and h be two Lyndon words satisfying $g < q$, $h < q$ and $gh \sim p$. The definition of $B_{gq,q}$ shows that $B_{gq,q} = \sum_{w \in \mathfrak{L}_{gq,q}} \mathbf{k} b_w$. In other words, $B_{gq,q}$ is the $\mathbf{k}$-linear span of the elements b_w with $w \in \mathfrak{L}_{gq,q}$. Hence, in order to prove the relation (13.151.25), it suffices to show that $f([b_w, b_h]) = [f(b_w), f(b_h)]$ for every $w \in \mathfrak{L}_{gq,q}$. But this follows from (13.151.24) (applied to $r = w$). This proves (13.151.25).

We thus have proven (13.151.19). In other words, (13.151.17) holds in the case when $\ell(pq) = N$. This completes the induction step (in the induction proof of (13.151.17)). The induction proof of (13.151.17) is thus complete.

Using (13.151.17), we can easily see the following fact: For any $p \in \mathfrak{L}$ and $q \in \mathfrak{L}$, we have

$$f([b_p, b_q]) = [f(b_p), f(b_q)] \tag{13.151.28}$$

[1062].

Now, we recall that B is the $\mathbf{k}$-submodule of $\mathfrak{g}$ spanned by the family $(b_w)_{w \in \mathfrak{L}}$. Thus, the family $(b_w)_{w \in \mathfrak{L}}$ spans the $\mathbf{k}$-module B.

Now, we have

$$f([x, y]) = [f(x), f(y)] \qquad \text{for every } x \in B \text{ and } y \in B \tag{13.151.29}$$

[1063]. In other words, the map $f : B \to \mathfrak{h}$ is a Lie algebra homomorphism. This solves Exercise 6.1.40(b).

13.152. **Solution to Exercise 6.1.41.** *Solution to Exercise 6.1.41.* The definition of $\mathfrak{g}$ shows that $\mathfrak{g} = \mathfrak{g}_1 + \mathfrak{g}_2 + \mathfrak{g}_3 + \cdots = \sum_{i \geq 1} \mathfrak{g}_i$. Thus, for every positive integer k, we have

$$\mathfrak{g}_k \subset \mathfrak{g}. \tag{13.152.1}$$

Notice that $\mathfrak{g}_1 = V$, so that

$$V = \mathfrak{g}_1 \subset \mathfrak{g} \qquad (\text{by (13.152.1), applied to } k = 1). \tag{13.152.2}$$

We also recall a fundamental property of Lie algebras (one of the forms of the Jacobi identity):

- Every three elements x, y and z of a Lie algebra $\mathfrak{k}$ satisfy

$$[[x, y], z] = [[x, z], y] - [[y, z], x]. \tag{13.152.3}$$

[1062] *Proof of (13.151.28):* Let $p \in \mathfrak{L}$ and $q \in \mathfrak{L}$. We need to prove that $f([b_p, b_q]) = [f(b_p), f(b_q)]$. If $p = q$, then this is clear (because if $p = q$, then $f\left(\left[\underbrace{b_p}_{\substack{=b_q \\ (\text{since } p=q)}}, b_q\right]\right) = f\left(\underbrace{[b_q, b_q]}_{=0}\right) = f(0) = 0$ and $\left[f\left(\underbrace{b_p}_{\substack{=b_q \\ (\text{since } p=q)}}\right), f(b_q)\right] = [f(b_q), f(b_q)] = 0$, so that both sides of the equality $f([b_p, b_q]) = [f(b_p), f(b_q)]$ vanish). Thus, for the rest of this proof, we WLOG assume that we don't have $p = q$.

We have $(p, q) \in \mathfrak{L} \times \mathfrak{L}$ (since $p \in \mathfrak{L}$ and $q \in \mathfrak{L}$) and $(q, p) \in \mathfrak{L} \times \mathfrak{L}$ (since $q \in \mathfrak{L}$ and $p \in \mathfrak{L}$). We have $p \neq q$ (since we don't have $p = q$). Thus, we have either $p < q$ or $p > q$ (since the lexicographic order on $\mathfrak{A}^*$ is a total order). In other words, we are in one of the following two Cases:

Case 1: We have $p < q$.

Case 2: We have $p > q$.

Let us first consider Case 1. In this case, we have $p < q$. Thus, from (13.151.17), we obtain $f([b_p, b_q]) = [f(b_p), f(b_q)]$. Thus, $f([b_p, b_q]) = [f(b_p), f(b_q)]$ is proven in Case 1.

Let us now consider Case 2. In this case, we have $p > q$. In other words, $q < p$. Thus, (13.151.17) (applied to (q, p) instead of (p, q)) shows that $f([b_q, b_p]) = [f(b_q), f(b_p)]$. Now,

$$f\left(\underbrace{[b_p, b_q]}_{=-[b_q, b_p]}\right) = f(-[b_q, b_p]) = -\underbrace{f([b_q, b_p])}_{=[f(b_q), f(b_p)]} = -[f(b_q), f(b_p)] = [f(b_p), f(b_q)].$$

Thus, $f([b_p, b_q]) = [f(b_p), f(b_q)]$ is proven in Case 2.

Now, $f([b_p, b_q]) = [f(b_p), f(b_q)]$ is proven in each of the two Cases 1 and 2. This completes the proof of (13.151.28).

[1063] *Proof of (13.151.29):* Let $x \in B$ and $y \in B$. We must prove the equality $f([x, y]) = [f(x), f(y)]$. Both sides of this equality are $\mathbf{k}$-linear in each of x and y. Hence, we can WLOG assume that both x and y belong to the family $(b_w)_{w \in \mathfrak{L}}$ (since the family $(b_w)_{w \in \mathfrak{L}}$ spans the $\mathbf{k}$-module B). In other words, we can WLOG assume that there exist $p \in \mathfrak{L}$ and $q \in \mathfrak{L}$ satisfying $x = b_p$ and $y = b_q$. Assume this, and consider these p and q.

From (13.151.28), we obtain $f([b_p, b_q]) = [f(b_p), f(b_q)]$. This rewrites as $f([x, y]) = [f(x), f(y)]$ (since $x = b_p$ and $y = b_q$). This proves (13.151.29).

(a) For every two positive integers i and j, we have

$$[\mathfrak{g}_i, \mathfrak{g}_j] \subset \mathfrak{g}_{i+j}. \tag{13.152.4}$$

Proof of (13.152.4): We shall prove (13.152.4) by induction over i:

Induction base: For every positive integer j, we have $[\mathfrak{g}_1, \mathfrak{g}_j] \subset \mathfrak{g}_{1+j}$ [1064]. In other words, (13.152.4) holds for $i = 1$. This completes the induction base.

Induction step: Let I be a positive integer. Assume that (13.152.4) holds for $i = I$. We must prove that (13.152.4) holds for $i = I + 1$.

We have assumed that (13.152.4) holds for $i = I$. In other words, for every positive integer j, we have

$$[\mathfrak{g}_I, \mathfrak{g}_j] \subset \mathfrak{g}_{I+j}. \tag{13.152.5}$$

Now, let j be a positive integer. Thus, the recursive definition of $\mathfrak{g}_{j+1}$ yields $\mathfrak{g}_{j+1} = \left[V, \underbrace{\mathfrak{g}_{(j+1)-1}}_{=\mathfrak{g}_j}\right] = [V, \mathfrak{g}_j]$. The same argument (applied to I instead of j) shows that $\mathfrak{g}_{I+1} = [V, \mathfrak{g}_I]$.

Also, the recursive definition of $\mathfrak{g}_{I+j+1}$ yields $\mathfrak{g}_{I+j+1} = \left[V, \underbrace{\mathfrak{g}_{(I+j+1)-1}}_{=\mathfrak{g}_{I+j}}\right] = [V, \mathfrak{g}_{I+j}]$.

Now, let $z \in \mathfrak{g}_j$. Then, $z \in \mathfrak{g}_j \subset \mathfrak{g}$ (by (13.152.1), applied to $k = j$).

Also, let $p \in \mathfrak{g}_{I+1}$. We are going to prove that $[p, z] \in \mathfrak{g}_{I+1+j}$.

Recall that $[V, \mathfrak{g}_I]$ is the $\mathbf{k}$-linear span of all elements of the form $[x, y]$ with $(x, y) \in V \times \mathfrak{g}_I$ (indeed, this is how $[V, \mathfrak{g}_I]$ is defined). Thus, p is a $\mathbf{k}$-linear combination of elements of the form $[x, y]$ with $(x, y) \in V \times \mathfrak{g}_I$ (since $p \in \mathfrak{g}_{I+1} = [V, \mathfrak{g}_I]$).

Now, we must prove the relation $[p, z] \in \mathfrak{g}_{I+1+j}$. But this relation is $\mathbf{k}$-linear in p. Thus, we WLOG assume that p is an element of the form $[x, y]$ for with $(x, y) \in V \times \mathfrak{g}_I$ (since p is a $\mathbf{k}$-linear combination of elements of the form $[x, y]$ with $(x, y) \in V \times \mathfrak{g}_I$). In other words, there exists an $(x, y) \in V \times \mathfrak{g}_I$ such that $p = [x, y]$. Consider this (x, y).

[1064] *Proof.* Let j be a positive integer. Thus, the recursive definition of $\mathfrak{g}_{1+j}$ yields $\mathfrak{g}_{1+j} = \left[V, \underbrace{\mathfrak{g}_{(1+j)-1}}_{=\mathfrak{g}_j}\right] = [V, \mathfrak{g}_j]$, so that $[V, \mathfrak{g}_j] = \mathfrak{g}_{1+j}$. Now, $\left[\underbrace{\mathfrak{g}_1}_{=V}, \mathfrak{g}_j\right] = [V, \mathfrak{g}_j] = \mathfrak{g}_{1+j} \subset \mathfrak{g}_{1+j}$, qed.

We have $(x, y) \in V \times \mathfrak{g}_I$. In other words, $x \in V$ and $y \in \mathfrak{g}_I$. Thus, $y \in \mathfrak{g}_I \subset \mathfrak{g}$ (by (13.152.1), applied to $k = I$). Also, $x \in V \subset \mathfrak{g}$ (by (13.152.2)). Now,

$$\begin{aligned} \Bigg[\underbrace{p}_{=[x,y]}, z\Bigg] &= [[x,y],z] = \underbrace{[[x,z],y]}_{=-[y,[x,z]]} - \underbrace{[[y,z],x]}_{=-[x,[y,z]]} \qquad (\text{by } (13.152.3)) \\ &= -[y,[x,z]] - (-[x,[y,z]]) = \Bigg[\underbrace{x}_{\in V}, \Bigg[\underbrace{y}_{\in \mathfrak{g}_I}, \underbrace{z}_{\in\mathfrak{g}_j}\Bigg]\Bigg] - \Bigg[\underbrace{y}_{\in\mathfrak{g}_I}, \Bigg[\underbrace{x}_{\in V}, \underbrace{z}_{\in \mathfrak{g}_j}\Bigg]\Bigg] \\ &\in \Bigg[V, \underbrace{[\mathfrak{g}_I,\mathfrak{g}_j]}_{\substack{\subset \mathfrak{g}_{I+j} \\ (\text{by } (13.152.5))}}\Bigg] - \Bigg[\mathfrak{g}_I, \underbrace{[V,\mathfrak{g}_j]}_{\substack{=\mathfrak{g}_{j+1}\\(\text{since } \mathfrak{g}_{j+1}=[V,\mathfrak{g}_j])}}\Bigg] \\ &\subset \underbrace{[V,\mathfrak{g}_{I+j}]}_{\substack{=\mathfrak{g}_{I+j+1}\\ (\text{since } \mathfrak{g}_{I+j+1}=[V,\mathfrak{g}_{I+j}])}} - \underbrace{[\mathfrak{g}_I,\mathfrak{g}_{j+1}]}_{\substack{\subset \mathfrak{g}_{I+j+1}\\ (\text{by } (13.152.5)\text{, applied to } j+1 \text{ instead of } j)}} \\ &\subset \mathfrak{g}_{I+j+1} - \mathfrak{g}_{I+j+1} \subset \mathfrak{g}_{I+j+1} \qquad (\text{since } \mathfrak{g}_{I+j+1} \text{ is a } \mathbf{k}\text{-module}) \\ &= \mathfrak{g}_{I+1+j}. \end{aligned}$$

Now, let us forget that we fixed z and p. We thus have proven that $[p, z] \in \mathfrak{g}_{I+1+j}$ for any $p \in \mathfrak{g}_{I+1}$ and $z \in \mathfrak{g}_j$. Thus, $[\mathfrak{g}_{I+1}, \mathfrak{g}_j] \subset \mathfrak{g}_{I+1+j}$ (since $\mathfrak{g}_{I+1+j}$ is a $\mathbf{k}$-module).

Let us now forget that we fixed j. We thus have proven that, for every positive integer j, we have $[\mathfrak{g}_{I+1}, \mathfrak{g}_j] \subset \mathfrak{g}_{I+1+j}$. In other words, (13.152.4) holds for $i = I + 1$. This completes the induction step. The induction proof of (13.152.4) is thus complete.

Now, for every two positive integers i and j, we have

$$\begin{aligned} [\mathfrak{g}_i, \mathfrak{g}_j] &\subset \mathfrak{g}_{i+j} \qquad (\text{by } (13.152.4)) \\ &\subset \mathfrak{g} \qquad (\text{by } (13.152.1)\text{, applied to } k = i + j)\,. \end{aligned} \tag{13.152.6}$$

But $\mathfrak{g} = \sum_{i \geq 1} \mathfrak{g}_i = \sum_{j \geq 1} \mathfrak{g}_j$ (here, we have renamed the summation index i as j). Thus,

$$\begin{aligned} \Bigg[\underbrace{\mathfrak{g}}_{=\sum_{i\geq 1}\mathfrak{g}_i}, \underbrace{\mathfrak{g}}_{=\sum_{j\geq 1}\mathfrak{g}_j}\Bigg] &= \left[\sum_{i\geq 1}\mathfrak{g}_i, \sum_{j\geq 1}\mathfrak{g}_j\right] \\ &\subset \sum_{i\geq 1}\sum_{j\geq 1} \underbrace{[\mathfrak{g}_i, \mathfrak{g}_j]}_{\substack{\subset\mathfrak{g} \\ (\text{by } (13.152.6))}} \qquad (\text{since the Lie bracket on } T(V) \text{ is } \mathbf{k}\text{-bilinear}) \\ &\subset \sum_{i\geq 1}\sum_{j\geq 1} \mathfrak{g} \subset \mathfrak{g} \qquad (\text{since } \mathfrak{g} \text{ is a } \mathbf{k}\text{-module})\,. \end{aligned}$$

Thus, $\mathfrak{g}$ is a Lie subalgebra of $T(V)$. This solves Exercise 6.1.41(a).

(b) Let $\mathfrak{k}$ be any Lie subalgebra of $T(V)$ satisfying $V \subset \mathfrak{k}$. We must prove that $\mathfrak{g} \subset \mathfrak{k}$.

We claim that

$$\mathfrak{g}_k \subset \mathfrak{k} \qquad \text{for every positive integer } k. \tag{13.152.7}$$

Proof of (13.152.7): We shall prove (13.152.7) by induction over k:

Induction base: We have $\mathfrak{g}_1 = V \subset \mathfrak{k}$. In other words, (13.152.7) holds for $i = 1$. This completes the induction base.

Induction step: Let K be a positive integer. Assume that (13.152.7) holds for $k = K$. We must prove that (13.152.7) holds for $k = K + 1$.

We have assumed that (13.152.7) holds for $k = K$. In other words, we have $\mathfrak{g}_K \subset \mathfrak{k}$.

But $\mathfrak{k}$ is a Lie subalgebra of $T(V)$. Hence, $[\mathfrak{k}, \mathfrak{k}] \subset \mathfrak{k}$.

Now, the recursive definition of $\mathfrak{g}_{K+1}$ yields $\mathfrak{g}_{K+1} = \left[\underbrace{V}_{\subset \mathfrak{k}}, \underbrace{\mathfrak{g}_{(K+1)-1}}_{=\mathfrak{g}_K \subset \mathfrak{k}}\right] \subset [\mathfrak{k}, \mathfrak{k}] \subset \mathfrak{k}$. In other words, (13.152.7) holds for $k = K+1$. This completes the induction step. The induction proof of (13.152.7) is thus complete.

Now,

$$\mathfrak{g} = \sum_{i \geq 1} \underbrace{\mathfrak{g}_i}_{\substack{\subset \mathfrak{k} \\ \text{(by (13.152.7), applied to } k=i\text{)}}} \subset \sum_{i \geq 1} \mathfrak{k} \subset \mathfrak{k}$$

(since $\mathfrak{k}$ is a $\mathbf{k}$-module (since $\mathfrak{k}$ is a Lie algebra)). This solves Exercise 6.1.41(b).

Before we step to the solution of Exercise 6.1.41(c), we record a simple fact: If $u \in \mathfrak{A}^*$ and $v \in \mathfrak{A}^*$, then

$$x_u x_v = x_{uv} \tag{13.152.8}$$

in the $\mathbf{k}$-algebra $T(V)$ [1065].

(c) We shall solve Exercise 6.1.41(c) by strong induction on $\ell(w)$:

Induction step: Let $N \in \mathbb{N}$. Assume that Exercise 6.1.41(c) holds under the condition that $\ell(w) < N$. We need to show that Exercise 6.1.41(c) also holds under the condition that $\ell(w) = N$.

We have assumed that Exercise 6.1.41(c) holds under the condition that $\ell(w) < N$. In other words, we have

$$b_w \in x_w + \sum_{\substack{v \in \mathfrak{A}^{\ell(w)}; \\ v > w}} \mathbf{k} x_v \qquad \text{for every } w \in \mathfrak{L} \text{ satisfying } \ell(w) < N. \tag{13.152.10}$$

For every $w \in \mathfrak{L}$ satisfying $\ell(w) < N$, we have

$$\begin{aligned} b_w &\in x_w + \sum_{\substack{v \in \mathfrak{A}^{\ell(w)}; \\ v > w}} \mathbf{k} x_v \\ &= x_w + \sum_{\substack{p \in \mathfrak{A}^{\ell(w)}; \\ p > w}} \mathbf{k} x_p \qquad \text{(here, we renamed the summation index } v \text{ as } p) \qquad (13.152.11) \\ &= x_w + \sum_{\substack{q \in \mathfrak{A}^{\ell(w)}; \\ q > w}} \mathbf{k} x_q \qquad \text{(here, we renamed the summation index } p \text{ as } q)\,. \qquad (13.152.12) \end{aligned}$$

[1065] *Proof of (13.152.8):* Let $u \in \mathfrak{A}^*$ and $v \in \mathfrak{A}^*$. We have $uv = \left((uv)_1, (uv)_2, \ldots, (uv)_{\ell(uv)}\right)$ and thus

$$\begin{aligned} \left((uv)_1, (uv)_2, \ldots, (uv)_{\ell(uv)}\right) &= \underbrace{u}_{=(u_1, u_2, \ldots, u_{\ell(u)})} \underbrace{v}_{=(v_1, v_2, \ldots, v_{\ell(v)})} \\ &= \left(u_1, u_2, \ldots, u_{\ell(u)}\right)\left(v_1, v_2, \ldots, v_{\ell(v)}\right) = \left(u_1, u_2, \ldots, u_{\ell(u)}, v_1, v_2, \ldots, v_{\ell(v)}\right) \end{aligned}$$

and therefore

$$x_{(uv)_1} \otimes x_{(uv)_2} \otimes \cdots \otimes x_{(uv)_{\ell(uv)}} = x_{u_1} \otimes x_{u_2} \otimes \cdots \otimes x_{u_{\ell(u)}} \otimes x_{v_1} \otimes x_{v_2} \otimes \cdots \otimes x_{v_{\ell(v)}}.$$

The definition of x_{uv} now yields

$$x_{uv} = x_{(uv)_1} \otimes x_{(uv)_2} \otimes \cdots \otimes x_{(uv)_{\ell(uv)}} = x_{u_1} \otimes x_{u_2} \otimes \cdots \otimes x_{u_{\ell(u)}} \otimes x_{v_1} \otimes x_{v_2} \otimes \cdots \otimes x_{v_{\ell(v)}}. \tag{13.152.9}$$

But the definition of x_u yields $x_u = x_{u_1} \otimes x_{u_2} \otimes \cdots \otimes x_{u_{\ell(u)}}$, and the definition of x_v yields $x_v = x_{v_1} \otimes x_{v_2} \otimes \cdots \otimes x_{v_{\ell(v)}}$. Thus,

$$\begin{aligned} &\underbrace{x_u}_{=x_{u_1} \otimes x_{u_2} \otimes \cdots \otimes x_{u_{\ell(u)}}} \underbrace{x_v}_{=x_{v_1} \otimes x_{v_2} \otimes \cdots \otimes x_{v_{\ell(v)}}} \\ &= \left(x_{u_1} \otimes x_{u_2} \otimes \cdots \otimes x_{u_{\ell(u)}}\right)\left(x_{v_1} \otimes x_{v_2} \otimes \cdots \otimes x_{v_{\ell(v)}}\right) \\ &= x_{u_1} \otimes x_{u_2} \otimes \cdots \otimes x_{u_{\ell(u)}} \otimes x_{v_1} \otimes x_{v_2} \otimes \cdots \otimes x_{v_{\ell(v)}} \\ &= x_{uv} \qquad \text{(by (13.152.9))}\,. \end{aligned}$$

This proves (13.152.8).

From this, it is easy to conclude the following: For every $w \in \mathfrak{L}$ satisfying $\ell(w) < N$, we have

$$b_w \in \sum_{\substack{q \in \mathfrak{A}^{\ell(w)}; \\ q \geq w}} \mathbf{k} x_q \tag{13.152.13}$$

[1066].

Now, let $w \in \mathfrak{L}$ be such that $\ell(w) = N$. We shall prove that $b_w \in x_w + \sum_{\substack{r \in \mathfrak{A}^{\ell(w)}; \\ r > w}} \mathbf{k} x_r$.

If $\ell(w) \leq 1$, then $b_w \in x_w + \sum_{\substack{r \in \mathfrak{A}^{\ell(w)}; \\ r > w}} \mathbf{k} x_r$ holds[1067]. Hence, for the rest of this proof, we can WLOG assume that we don't have $\ell(w) \leq 1$. Assume this.

The word w is Lyndon (since $w \in \mathfrak{L}$) and satisfies $\ell(w) > 1$ (since we don't have $\ell(w) \leq 1$). Thus, w is a Lyndon word of length > 1. Therefore, $\operatorname{stf} w$ is well-defined. Let $(u, v) = \operatorname{stf} w$. The recursive definition of b_w yields $b_w = [b_u, b_v]$ (since $\ell(w) > 1$ and $(u, v) = \operatorname{stf} w$).

From Exercise 6.1.39(a) (applied to $(g, h) = (u, v)$), we see that v is the longest Lyndon proper suffix of w. In particular, v is a Lyndon proper suffix of w. Also, Exercise 6.1.39(d) (applied to $(g, h) = (u, v)$) shows that the word u is Lyndon. From Exercise 6.1.39(c) (applied to $(g, h) = (u, v)$), we obtain $u < uv < v$. Finally, Exercise 6.1.39(b) (applied to $(g, h) = (u, v)$) shows that $w = uv$. Exercise 6.1.39(e) (applied to $(g, h) = (u, v)$) shows that $u \in \mathfrak{L}$, $v \in \mathfrak{L}$, $\ell(u) < \ell(w)$ and $\ell(v) < \ell(w)$.

The word u is Lyndon and thus nonempty. Hence, $\ell(u) \geq 1$. Also, the word v is Lyndon and thus nonempty. Thus, $\ell(v) \geq 1$.

Now, $\ell(u) < \ell(w) = N$. Thus, (13.152.11) (applied to u instead of w) shows that

$$b_u \in x_u + \sum_{\substack{p \in \mathfrak{A}^{\ell(u)}; \\ p > u}} \mathbf{k} x_p. \tag{13.152.14}$$

[1066] *Proof of (13.152.13):* Let $w \in \mathfrak{L}$ be such that $\ell(w) < N$.

Every $q \in \mathfrak{A}^{\ell(w)}$ satisfying $q > w$ must also satisfy $q \geq w$. Thus, $\sum_{\substack{q \in \mathfrak{A}^{\ell(w)}; \\ q > w}} \mathbf{k} x_q \subset \sum_{\substack{q \in \mathfrak{A}^{\ell(w)}; \\ q \geq w}} \mathbf{k} x_q$.

On the other hand, w is an element of $\mathfrak{A}^{\ell(w)}$ (since $\ell(w) = \ell(w)$) and satisfies $w \geq w$. In other words, w is a $q \in \mathfrak{A}^{\ell(w)}$ satisfying $q \geq w$. Thus, $\mathbf{k} x_w$ is an addend of the sum $\sum_{\substack{q \in \mathfrak{A}^{\ell(w)}; \\ q \geq w}} \mathbf{k} x_q$. Hence, $\mathbf{k} x_w \subset \sum_{\substack{q \in \mathfrak{A}^{\ell(w)}; \\ q \geq w}} \mathbf{k} x_q$.

Now, $x_w \in \mathbf{k} x_w \subset \sum_{\substack{q \in \mathfrak{A}^{\ell(w)}; \\ q \geq w}} \mathbf{k} x_q$. But (13.152.12) becomes

$$b_w \in \underbrace{x_w}_{\in \sum_{\substack{q \in \mathfrak{A}^{\ell(w)}; \\ q \geq w}} \mathbf{k} x_q} + \underbrace{\sum_{\substack{q \in \mathfrak{A}^{\ell(w)}; \\ q > w}} \mathbf{k} x_q}_{\subset \sum_{\substack{q \in \mathfrak{A}^{\ell(w)}; \\ q \geq w}} \mathbf{k} x_q} \subset \sum_{\substack{q \in \mathfrak{A}^{\ell(w)}; \\ q \geq w}} \mathbf{k} x_q + \sum_{\substack{q \in \mathfrak{A}^{\ell(w)}; \\ q \geq w}} \mathbf{k} x_q \subset \sum_{\substack{q \in \mathfrak{A}^{\ell(w)}; \\ q \geq w}} \mathbf{k} x_q$$

(since $\sum_{\substack{q \in \mathfrak{A}^{\ell(w)}; \\ q \geq w}} \mathbf{k} x_q$ is a $\mathbf{k}$-module). This proves (13.152.13).

[1067] *Proof.* Assume that $\ell(w) \leq 1$. The word w is Lyndon (since $w \in \mathfrak{L}$) and thus nonempty. Hence, $\ell(w) \geq 1$. Combined with $\ell(w) \leq 1$, this yields $\ell(w) = 1$. In other words, the word w consists of a single letter. In other words, $w = (a)$ for some $a \in \mathfrak{A}$. Consider this a. The definition of b_w then yields $b_w = x_a$ (since $\ell(w) = 1$ and $w = (a)$).

On the other hand, the definition of x_w yields $x_w = x_a$ (since $w = (a)$). Compared with $b_w = x_a$, this yields

$$b_w = x_w = x_w + \underbrace{0}_{\substack{\in \sum_{\substack{r \in \mathfrak{A}^{\ell(w)}; \\ r > w}} \mathbf{k} x_r \\ \left(\text{since } \sum_{\substack{r \in \mathfrak{A}^{\ell(w)}; \\ r > w}} \mathbf{k} x_r \text{ is a } \mathbf{k}\text{-module}\right)}} \in x_w + \sum_{\substack{r \in \mathfrak{A}^{\ell(w)}; \\ r > w}} \mathbf{k} x_r,$$

qed.

Also, (13.152.13) (applied to u instead of w) shows that

$$b_u \in \sum_{\substack{q \in \mathfrak{A}^{\ell(u)}; \\ q \geq u}} \mathbf{k} x_q = \sum_{\substack{p \in \mathfrak{A}^{\ell(u)}; \\ p \geq u}} \mathbf{k} x_p \tag{13.152.15}$$

(here, we renamed the summation index q as p).

Also, $\ell(v) < \ell(w) = N$. Thus, (13.152.12) (applied to v instead of w) shows that

$$b_v \in x_v + \sum_{\substack{q \in \mathfrak{A}^{\ell(v)}; \\ q > v}} \mathbf{k} x_q. \tag{13.152.16}$$

Also, (13.152.13) (applied to v instead of w) shows that

$$b_v \in \sum_{\substack{q \in \mathfrak{A}^{\ell(v)}; \\ q \geq v}} \mathbf{k} x_q. \tag{13.152.17}$$

Now, let $G = \sum\limits_{\substack{r \in \mathfrak{A}^{\ell(w)}; \\ r > w}} \mathbf{k} x_r$. Thus, $G = \sum\limits_{\substack{r \in \mathfrak{A}^{\ell(w)}; \\ r > w}} \mathbf{k} x_r$ is a $\mathbf{k}$-submodule of $T(V)$.

If $p \in \mathfrak{A}^{\ell(u)}$ and $q \in \mathfrak{A}^{\ell(v)}$ are such that $q \geq v$, then

$$x_q x_p \in G \tag{13.152.18}$$

[1068]. Hence,

$$b_v b_u \in G \tag{13.152.19}$$

[1069].

Furthermore, if $p \in \mathfrak{A}^{\ell(u)}$ and $q \in \mathfrak{A}^{\ell(v)}$ are such that $p > u$, then

$$x_p x_q \in G \tag{13.152.20}$$

[1068] *Proof of (13.152.18):* Let $p \in \mathfrak{A}^{\ell(u)}$ and $q \in \mathfrak{A}^{\ell(v)}$ be such that $q \geq v$.

We have $\ell(qp) = \underbrace{\ell(q)}_{\substack{= \ell(v) \\ (\text{since } q \in \mathfrak{A}^{\ell(v)})}} + \underbrace{\ell(p)}_{\substack{= \ell(u) \\ (\text{since } p \in \mathfrak{A}^{\ell(u)})}} = \ell(v) + \ell(u) = \ell(u) + \ell(v)$. Compared with $\ell(w) = \ell(u) + \ell(v)$, this yields $\ell(qp) = \ell(w)$. In other words, $qp \in \mathfrak{A}^{\ell(w)}$.

But the word w is Lyndon and satisfies $w = uv$. Thus, Proposition 6.1.14(a) shows that $v \geq w$ (since v is nonempty). Since $\ell(v) \neq \ell(w)$ (because $\ell(v) < \ell(w)$), we have $v \neq w$. Combined with $v \geq w$, this yields $v > w$. Now, $qp \geq q \geq v > w$.

So we know that $qp \in \mathfrak{A}^{\ell(w)}$ and $qp > w$. In other words, qp is an $r \in \mathfrak{A}^{\ell(w)}$ satisfying $r > w$. Thus, $\mathbf{k} x_{qp}$ is an addend of the sum $\sum\limits_{\substack{r \in \mathfrak{A}^{\ell(w)}; \\ r > w}} \mathbf{k} x_r$. Therefore, $\mathbf{k} x_{qp} \subset \sum\limits_{\substack{r \in \mathfrak{A}^{\ell(w)}; \\ r > w}} \mathbf{k} x_r = G$ (since $G = \sum\limits_{\substack{r \in \mathfrak{A}^{\ell(w)}; \\ r > w}} \mathbf{k} x_r$).

But (13.152.8) (applied to q and p instead of u and v) shows that $x_q x_p = x_{qp} \in \mathbf{k} x_{qp} \subset G$. This proves (13.152.18).

[1069] *Proof of (13.152.19):* We have

$$\begin{aligned} & \underbrace{b_v}_{\substack{\in \sum\limits_{\substack{q \in \mathfrak{A}^{\ell(v)}; \\ q \geq v}} \mathbf{k} x_q \\ (\text{by } (13.152.17))}} \underbrace{b_u}_{\substack{\in \sum\limits_{\substack{p \in \mathfrak{A}^{\ell(u)}; \\ p \geq u}} \mathbf{k} x_p \\ (\text{by } (13.152.15))}} \\ & = \left(\sum_{\substack{q \in \mathfrak{A}^{\ell(v)}; \\ q \geq v}} \mathbf{k} x_q \right) \left(\sum_{\substack{p \in \mathfrak{A}^{\ell(u)}; \\ p \geq u}} \mathbf{k} x_p \right) \subset \sum_{\substack{q \in \mathfrak{A}^{\ell(v)}; \\ q \geq v}} \sum_{\substack{p \in \mathfrak{A}^{\ell(u)}; \\ p \geq u}} \underbrace{\mathbf{k}\mathbf{k}}_{\subset \mathbf{k}} \underbrace{x_q x_p}_{\substack{\in G \\ (\text{by } (13.152.18))}} \subset \sum_{\substack{q \in \mathfrak{A}^{\ell(v)}; \\ q \geq v}} \sum_{\substack{p \in \mathfrak{A}^{\ell(u)}; \\ p \geq u}} \mathbf{k} G \subset G \end{aligned}$$

(since G is a $\mathbf{k}$-module). This proves (13.152.19).

[1070]. Hence,

$$(b_u - x_u)\, b_v \in G \tag{13.152.21}$$

[1071].

Furthermore, if $q \in \mathfrak{A}^{\ell(v)}$ is such that $q > v$, then

$$x_u x_q \in G \tag{13.152.22}$$

[1072]. Hence,

$$x_u\,(b_v - x_v) \in G \tag{13.152.23}$$

[1070] *Proof of (13.152.20):* Let $p \in \mathfrak{A}^{\ell(u)}$ and $q \in \mathfrak{A}^{\ell(v)}$ be such that $p > u$.

We have $\ell(pq) = \underbrace{\ell(p)}_{\substack{=\ell(u) \\ (\text{since } p \in \mathfrak{A}^{\ell(u)})}} + \underbrace{\ell(q)}_{\substack{=\ell(v) \\ (\text{since } q \in \mathfrak{A}^{\ell(v)})}} = \ell(u) + \ell(v)$. Compared with $\ell(w) = \ell(u) + \ell(v)$, this yields $\ell(pq) = \ell(w)$. In other words, $pq \in \mathfrak{A}^{\ell(w)}$.

We have $\ell(p) = \ell(u)$ (since $p \in \mathfrak{A}^{\ell(u)}$), so that $\ell(u) = \ell(p)$.

Assume (for the sake of contradiction) that the word u is a prefix of p. Since the word u has the same length as p (since $\ell(u) = \ell(p)$), this shows that $u = p$. Thus, $u = p > u$, which is absurd. This contradiction shows that our assumption (that the word u is a prefix of p) was false. In other words, the word u is not a prefix of p.

We have $u < p$ (since $p > u$), thus $u \leq p$. Thus, Proposition 6.1.2(d) (applied to u, v, p and $\varnothing$ instead of a, b, c and d) shows that either we have $uv \leq p\varnothing$ or the word u is a prefix of p. Since the word u is not a prefix of p, we thus conclude that $uv \leq p\varnothing$. Hence, $w = uv \leq p\varnothing = p$.

Now, $q \in \mathfrak{A}^{\ell(v)}$, so that $\ell(q) = \ell(v) \geq 1$. The word q is thus nonempty. Hence, $p < pq$. Thus, $w \leq p < pq$, so that $pq > w$.

So we know that $pq \in \mathfrak{A}^{\ell(w)}$ and $pq > w$. In other words, pq is an $r \in \mathfrak{A}^{\ell(w)}$ satisfying $r > w$. Thus, $\mathbf{k}x_{pq}$ is an addend of the sum $\sum_{\substack{r \in \mathfrak{A}^{\ell(w)}; \\ r > w}} \mathbf{k}x_r$. Therefore, $\mathbf{k}x_{pq} \subset \sum_{\substack{r \in \mathfrak{A}^{\ell(w)}; \\ r > w}} \mathbf{k}x_r = G$ (since $G = \sum_{\substack{r \in \mathfrak{A}^{\ell(w)}; \\ r > w}} \mathbf{k}x_r$).

But (13.152.8) (applied to p and q instead of u and v) shows that $x_p x_q = x_{pq} \in \mathbf{k}x_{pq} \subset G$. This proves (13.152.20).

[1071] *Proof of (13.152.21):* Subtracting x_u from both sides of the relation (13.152.14), we obtain

$$b_u - x_u \in \sum_{\substack{p \in \mathfrak{A}^{\ell(u)}; \\ p > u}} \mathbf{k}x_p.$$

Now,

$$\begin{aligned} &\underbrace{(b_u - x_u)}_{\in \sum_{\substack{p \in \mathfrak{A}^{\ell(u)}; \\ p > u}} \mathbf{k}x_p} \underbrace{b_v}_{\substack{\in \sum_{\substack{q \in \mathfrak{A}^{\ell(v)}; \\ q \geq v}} \mathbf{k}x_q \\ (\text{by } (13.152.17))}} \\ &\in \left(\sum_{\substack{p \in \mathfrak{A}^{\ell(u)}; \\ p > u}} \mathbf{k}x_p \right) \left(\sum_{\substack{q \in \mathfrak{A}^{\ell(v)}; \\ q \geq v}} \mathbf{k}x_q \right) \subset \sum_{\substack{p \in \mathfrak{A}^{\ell(u)}; \\ p > u}} \sum_{\substack{q \in \mathfrak{A}^{\ell(v)}; \\ q \geq v}} \underbrace{\mathbf{k}\mathbf{k}}_{\subset \mathbf{k}} \underbrace{x_p x_q}_{\substack{\in G \\ (\text{by } (13.152.20))}} \subset \sum_{\substack{p \in \mathfrak{A}^{\ell(u)}; \\ p > u}} \sum_{\substack{q \in \mathfrak{A}^{\ell(v)}; \\ q \geq v}} \mathbf{k}G \subset G \end{aligned}$$

(since G is a $\mathbf{k}$-module). This proves (13.152.21).

[1072] *Proof of (13.152.22):* Let $q \in \mathfrak{A}^{\ell(v)}$ be such that $q > v$.

We have $\ell(uq) = \ell(u) + \underbrace{\ell(q)}_{\substack{=\ell(v) \\ (\text{since } q \in \mathfrak{A}^{\ell(v)})}} = \ell(u) + \ell(v)$. Compared with $\ell(w) = \ell(u) + \ell(v)$, this yields $\ell(uq) = \ell(w)$. In other words, $uq \in \mathfrak{A}^{\ell(w)}$.

We have $q > v$, thus $v < q$, thus $v \leq q$. Hence, Proposition 6.1.2(b) (applied to u, v and q instead of a, c and d) shows that $uv \leq uq$. If we had $uv = uq$, then we would have $v = q$ (since we could cancel u from the equality $uv = uq$), which would contradict $v < q$. Thus, we cannot have $uv = uq$. Hence, we have $uv \neq uq$. Combined with $uv \leq uq$, this shows that $uv < uq$. In other words, $uq > uv = w$ (since $w = uv$).

So we know that $uq \in \mathfrak{A}^{\ell(w)}$ and $uq > w$. In other words, uq is an $r \in \mathfrak{A}^{\ell(w)}$ satisfying $r > w$. Thus, $\mathbf{k}x_{uq}$ is an addend of the sum $\sum_{\substack{r \in \mathfrak{A}^{\ell(w)}; \\ r > w}} \mathbf{k}x_r$. Therefore, $\mathbf{k}x_{uq} \subset \sum_{\substack{r \in \mathfrak{A}^{\ell(w)}; \\ r > w}} \mathbf{k}x_r = G$ (since $G = \sum_{\substack{r \in \mathfrak{A}^{\ell(w)}; \\ r > w}} \mathbf{k}x_r$).

But (13.152.8) (applied to u and q instead of u and v) shows that $x_u x_q = x_{uq} \in \mathbf{k}x_{uq} \subset G$. This proves (13.152.22).

[1073].

Now,

$$\begin{aligned} b_w &= [b_u, b_v] = b_u b_v - b_v b_u \qquad (\text{by the definition of the Lie bracket on } T(V)) \\ &= \underbrace{(b_u - x_u) b_v}_{\substack{\in G \\ (\text{by (13.152.21)})}} + \underbrace{x_u (b_v - x_v)}_{\substack{\in G \\ (\text{by (13.152.23)})}} + x_u x_v - \underbrace{b_v b_u}_{\substack{\in G \\ (\text{by (13.152.19)})}} \\ &\qquad (\text{by straightforward computation}) \\ &\in G + G + x_u x_v - G = \underbrace{x_u x_v}_{\substack{= x_{uv} \\ (\text{by (13.152.8)})}} + \underbrace{G + G - G}_{\substack{\subset G \\ (\text{since } G \text{ is a } \mathbf{k}\text{-module})}} \subset \underbrace{x_{uv}}_{\substack{= x_w \\ (\text{since } uv = w)}} + \underbrace{G}_{= \sum_{\substack{r \in \mathfrak{A}^{\ell(w)}; \\ r > w}} \mathbf{k} x_r} \\ &= x_w + \sum_{\substack{r \in \mathfrak{A}^{\ell(w)}; \\ r > w}} \mathbf{k} x_r . \end{aligned}$$

Thus, $b_w \in x_w + \sum_{\substack{r \in \mathfrak{A}^{\ell(w)}; \\ r > w}} \mathbf{k} x_r$ is proven.

Let us now forget that we defined (u, v). We have

$$b_w \in x_w + \sum_{\substack{r \in \mathfrak{A}^{\ell(w)}; \\ r > w}} \mathbf{k} x_r = x_w + \sum_{\substack{v \in \mathfrak{A}^{\ell(w)}; \\ v > w}} \mathbf{k} x_v$$

(here, we have renamed the summation index r as v).

Now, let us forget that we fixed w. We thus have proven that

$$b_w \in x_w + \sum_{\substack{v \in \mathfrak{A}^{\ell(w)}; \\ v > w}} \mathbf{k} x_v \qquad \text{for every } w \in \mathfrak{L} \text{ satisfying } \ell(w) = N.$$

In other words, we have proven that Exercise 6.1.41(c) holds under the condition that $\ell(w) = N$. Thus, our induction is complete, and Exercise 6.1.41(c) is solved.

(d) We know that $\mathfrak{g}$ is a Lie subalgebra of $T(V)$ (by Exercise 6.1.41(a)). Thus, $[\mathfrak{g}, \mathfrak{g}] \subset \mathfrak{g}$.

We first notice that

$$(13.152.24) \qquad b_w \in \mathfrak{g} \qquad \text{for every } w \in \mathfrak{L}.$$

Proof of (13.152.24): We shall prove (13.152.24) by strong induction on $\ell(w)$:

Induction step: Let $N \in \mathbb{N}$. Assume that (13.152.24) holds under the condition that $\ell(w) < N$. We need to show that (13.152.24) also holds under the condition that $\ell(w) = N$.

We have assumed that (13.152.24) holds under the condition that $\ell(w) < N$. In other words, we have

$$(13.152.25) \qquad b_w \in \mathfrak{g} \qquad \text{for every } w \in \mathfrak{L} \text{ satisfying } \ell(w) < N.$$

Now, let $w \in \mathfrak{L}$ be such that $\ell(w) = N$. We shall prove that $b_w \in \mathfrak{g}$.

[1073] *Proof of (13.152.23):* Subtracting x_v from both sides of the relation (13.152.16), we obtain

$$b_v - x_v \in \sum_{\substack{q \in \mathfrak{A}^{\ell(v)}; \\ q > v}} \mathbf{k} x_q .$$

Now,

$$x_u \underbrace{(b_v - x_v)}_{\in \sum_{\substack{q \in \mathfrak{A}^{\ell(v)}; \\ q > v}} \mathbf{k} x_q} \in x_u \left(\sum_{\substack{q \in \mathfrak{A}^{\ell(v)}; \\ q > v}} \mathbf{k} x_q \right) \subset \sum_{\substack{q \in \mathfrak{A}^{\ell(v)}; \\ q > v}} \mathbf{k} \underbrace{x_u x_q}_{\substack{\in G \\ (\text{by (13.152.22)})}} \subset \sum_{\substack{q \in \mathfrak{A}^{\ell(v)}; \\ q > v}} \mathbf{k} G \subset G$$

(since G is a $\mathbf{k}$-module). This proves (13.152.23).

If $\ell(w) \leq 1$, then $b_w \in \mathfrak{g}$ holds[1074]. Hence, for the rest of this proof, we can WLOG assume that we don't have $\ell(w) \leq 1$. Assume this.

The word w is Lyndon (since $w \in \mathfrak{L}$) and satisfies $\ell(w) > 1$ (since we don't have $\ell(w) \leq 1$). Thus, w is a Lyndon word of length > 1. Therefore, $\operatorname{stf} w$ is well-defined. Let $(u, v) = \operatorname{stf} w$. The recursive definition of b_w yields $b_w = [b_u, b_v]$ (since $\ell(w) > 1$ and $(u, v) = \operatorname{stf} w$).

Exercise 6.1.39(e) (applied to $(g, h) = (u, v)$) shows that $u \in \mathfrak{L}$, $v \in \mathfrak{L}$, $\ell(u) < \ell(w)$ and $\ell(v) < \ell(w)$.

Now, $\ell(u) < \ell(w) = N$. Thus, (13.152.25) (applied to u instead of w) shows that $b_u \in \mathfrak{g}$.

Also, $\ell(v) < \ell(w) = N$. Thus, (13.152.25) (applied to v instead of w) shows that $b_v \in \mathfrak{g}$.

Now, $b_w = \left[\underbrace{b_u}_{\in \mathfrak{g}}, \underbrace{b_v}_{\in \mathfrak{g}}\right] \in [\mathfrak{g}, \mathfrak{g}] \subset \mathfrak{g}$.

Let us now forget that we fixed w. We thus have shown that $b_w \in \mathfrak{g}$ for every $w \in \mathfrak{L}$ satisfying $\ell(w) = N$. In other words, (13.152.24) holds under the condition that $\ell(w) = N$. This completes the induction step. The induction proof of (13.152.24) is thus complete.

Now, (13.152.24) shows that $(b_w)_{w \in \mathfrak{L}}$ is a family of elements of $\mathfrak{g}$. Using Exercise 6.1.40(a), it is easy to conclude that this family $(b_w)_{w \in \mathfrak{L}}$ spans the $\mathbf{k}$-module $\mathfrak{g}$ [1075].

We shall now show that the family $(b_w)_{w \in \mathfrak{L}}$ is $\mathbf{k}$-linearly independent. In order to do so, we will prove a more general result:

Proposition 13.152.1. *Let $\mathfrak{V}$ be a $\mathbf{k}$-module, and let W be a totally ordered set. Let $(p_w)_{w \in W}$ be a $\mathbf{k}$-linearly independent family of elements of $\mathfrak{V}$. Let L be a subset of W. Let $(s_w)_{w \in L}$ be a family of elements of $\mathfrak{V}$. Assume that every $w \in L$ satisfies*

$$s_w \in p_w + \sum_{\substack{v \in W; \\ v > w}} \mathbf{k} p_v. \tag{13.152.28}$$

(Here, the ">" sign under the sum refers to the total order on W.) Then, the family $(s_w)_{w \in L}$ is $\mathbf{k}$-linearly independent.

Proposition 13.152.1 is actually a standard criterion for linear independence. It is often summarized by the motto "vectors with distinct leading coordinates are linearly independent". For the sake of completeness, we shall nevertheless prove it. First, let us state an obvious lemma:

[1074] *Proof.* Assume that $\ell(w) \leq 1$. The word w is Lyndon (since $w \in \mathfrak{L}$) and thus nonempty. Hence, $\ell(w) \geq 1$. Combined with $\ell(w) \leq 1$, this yields $\ell(w) = 1$. In other words, the word w consists of a single letter. In other words, $w = (a)$ for some $a \in \mathfrak{A}$. Consider this a. The definition of b_w then yields $b_w = x_a$ (since $\ell(w) = 1$ and $w = (a)$).

Now, $b_w = x_a \in V \subset \mathfrak{g}$, qed.

[1075] *Proof.* Let B be the $\mathbf{k}$-submodule of $\mathfrak{g}$ spanned by the family $(b_w)_{w \in \mathfrak{L}}$ (this is well-defined since $(b_w)_{w \in \mathfrak{L}}$ is a family of elements of $\mathfrak{g}$). Then, clearly,

$$b_w \in B \qquad \text{for every } w \in \mathfrak{L}. \tag{13.152.26}$$

Whenever w is a Lyndon word of length > 1, we have

$$b_w = [b_u, b_v], \qquad \text{where } (u, v) = \operatorname{stf} w$$

(due to the recursive definition of b_w). Thus, Exercise 6.1.40(a) shows that B is a Lie subalgebra of $\mathfrak{g}$. Hence, B is a Lie subalgebra of $T(V)$.

Recall that $(x_a)_{a \in \mathfrak{A}}$ is a basis of the $\mathbf{k}$-module V. Hence,

$$\left(\text{the } \mathbf{k}\text{-linear span of the family } (x_a)_{a \in \mathfrak{A}}\right) = V. \tag{13.152.27}$$

Now, let $a \in \mathfrak{A}$. We shall show that $x_a \in B$.

Indeed, let w be the one-letter word (a). Then, w is Lyndon (since w is a one-letter word) and has length 1. Thus, $b_w = x_a$ (by the definition of b_w, since $w = (a)$). Hence, $x_a = b_w \in B$ (by (13.152.26)).

Now, let us forget that we fixed a. We thus have shown that $x_a \in B$ for every $a \in \mathfrak{A}$. Since B is a $\mathbf{k}$-module, this entails that $\left(\text{the } \mathbf{k}\text{-linear span of the family } (x_a)_{a \in \mathfrak{A}}\right) \subset B$. Because of (13.152.27), this rewrites as $V \subset B$.

Now, we know that B is a Lie subalgebra of $T(V)$ satisfying $V \subset B$. Thus, $\mathfrak{g} \subset B$ (by Exercise 6.1.41(b), applied to $\mathfrak{k} = B$). Combined with $B \subset \mathfrak{g}$ (since B is a $\mathbf{k}$-submodule of $\mathfrak{g}$), this yields $\mathfrak{g} = B$. But the family $(b_w)_{w \in \mathfrak{L}}$ spans the $\mathbf{k}$-module B (since B is the $\mathbf{k}$-submodule of $\mathfrak{g}$ spanned by the family $(b_w)_{w \in \mathfrak{L}}$). Since $\mathfrak{g} = B$, this rewrites as follows: The family $(b_w)_{w \in \mathfrak{L}}$ spans the $\mathbf{k}$-module $\mathfrak{g}$. Qed.

Lemma 13.152.2. *Let $\mathfrak{V}$ be a $\mathbf{k}$-module, and let W be a set. Let $(p_w)_{w\in W}$ be a $\mathbf{k}$-linearly independent family of elements of $\mathfrak{V}$. Let $x \in W$ and $\lambda \in \mathbf{k}$ be such that*

$$0 \in \lambda p_x + \sum_{v\in W\setminus\{x\}} \mathbf{k} p_v . \tag{13.152.29}$$

Then, $\lambda = 0$.

Proof of Lemma 13.152.2. The equality (13.152.29) shows that we can write 0 as a $\mathbf{k}$-linear combination of the elements p_v with $v \in W$ in such a way that the coefficient in front of p_x is λ. But since $(p_w)_{w\in W}$ is $\mathbf{k}$-linearly independent, the only such linear combination which gives 0 is the trivial one (i.e., the one where all the coefficients are 0). Hence, all coefficients in our linear combination are 0. In particular, the coefficient in front of p_x is 0. Since this coefficient is λ, this means that $\lambda = 0$. This proves Lemma 13.152.2. □

Proof of Proposition 13.152.1. Let us first prove the following fact: If S is a finite subset of L, then

$$\text{the family } (s_w)_{w\in S} \text{ is } \mathbf{k}\text{-linearly independent.} \tag{13.152.30}$$

Proof of (13.152.30): We shall prove (13.152.30) by induction over $|S|$:

Induction base: If S is a finite subset of L satisfying $|S| = 0$, then the family $(s_w)_{w\in S}$ is $\mathbf{k}$-linearly independent (because $|S| = 0$ entails $S = \varnothing$, and thus the family $(s_w)_{w\in S}$ is empty). In other words, (13.152.30) holds in the case when $|S| = 0$. This completes the induction base.

Induction step: Let K be a positive integer. Assume that (13.152.30) is proven in the case when $|S| = K - 1$. We must prove that (13.152.30) holds in the case when $|S| = K$.

We have assumed that (13.152.30) is proven in the case when $|S| = K - 1$. In other words, if S is a finite subset of L satisfying $|S| = K - 1$, then

$$\text{the family } (s_w)_{w\in S} \text{ is } \mathbf{k}\text{-linearly independent.} \tag{13.152.31}$$

Now, let S be a finite subset of L satisfying $|S| = K$. Let $(\lambda_w)_{w\in S} \in \mathbf{k}^S$ be a family of elements of $\mathbf{k}$ such that $\sum_{w\in S} \lambda_w s_w = 0$. We shall prove that $(\lambda_w)_{w\in S} = (0)_{w\in S}$.

We have $|S| = K > 0$. Thus, the set S is nonempty. Also, $S \subset L \subset W$, and thus the set S is totally ordered (since it is a subset of the totally ordered set W). Therefore, this set S has a smallest element (since every nonempty finite totally ordered set has a smallest element). Let x be this smallest element. Thus,

$$x \leq w \qquad \text{for every } w \in S \tag{13.152.32}$$

(by the definition of the smallest element). Also, $x \in S$ (since x is the smallest element of S), and thus $|S \setminus \{x\}| = \underbrace{|S|}_{=K} - 1 = K - 1$. Hence, we can apply (13.152.31) to $S \setminus \{x\}$ instead of S. As a result, we see that the family $(s_w)_{w\in S\setminus\{x\}}$ is $\mathbf{k}$-linearly independent. In other words, if $(\mu_w)_{w\in S\setminus\{x\}} \in \mathbf{k}^{S\setminus\{x\}}$ is a family of elements of $\mathbf{k}$ such that $\sum_{w\in S\setminus\{x\}} \mu_w s_w = 0$, then

$$(\mu_w)_{w\in S\setminus\{x\}} = (0)_{w\in S\setminus\{x\}} . \tag{13.152.33}$$

On the other hand, every $w \in S \setminus \{x\}$ satisfies

$$s_w \in \sum_{v\in W\setminus\{x\}} \mathbf{k} p_v \tag{13.152.34}$$

[1076]. Also,

$$s_x - p_x \in \sum_{v\in W\setminus\{x\}} \mathbf{k} p_v \tag{13.152.35}$$

[1076] *Proof of (13.152.34):* Let $w \in S \setminus \{x\}$. Thus, $w \in S$ and $w \neq x$.

Let $v \in \{q \in W \mid q > w\}$. We shall show that $v \in W \setminus \{x\}$.

Indeed, we have $v \in \{q \in W \mid q > w\}$. In other words, v is an element of W and satisfies $v > w$. But $w \in S \setminus \{x\} \subset S$, so that (13.152.32) shows that $x \leq w$. Hence, $w \geq x$, so that $v > w \geq x$. Thus, $v \neq x$. Combining $v \in W$ with $v \neq x$, we obtain $v \in W \setminus \{x\}$.

Let us now forget that we fixed v. We thus have proven that every $v \in \{q \in W \mid q > w\}$ satisfies $v \in W \setminus \{x\}$. In other words, $\{q \in W \mid q > w\} \subset W \setminus \{x\}$. Therefore, $\sum_{v\in\{q\in W \mid q>w\}} \mathbf{k} p_v \subset \sum_{v\in W\setminus\{x\}} \mathbf{k} p_v$.

Also, combining $w \in W$ with $w \neq x$, we obtain $w \in W \setminus \{x\}$. Hence, $\mathbf{k} p_w$ is an addend of the sum $\sum_{v\in W\setminus\{x\}} \mathbf{k} p_v$. Thus, $\mathbf{k} p_w \subset \sum_{v\in W\setminus\{x\}} \mathbf{k} p_v$. Now, $p_w \in \mathbf{k} p_w \subset \sum_{v\in W\setminus\{x\}} \mathbf{k} p_v$.

[1077]. Now, $\sum_{w\in S}\lambda_w s_w = 0$, so that

$$\begin{aligned}
0 &= \sum_{w\in S}\lambda_w s_w = \lambda_x \underbrace{s_x}_{=p_x+(s_x-p_x)} + \underbrace{\sum_{\substack{w\in S;\\ w\neq x}}}_{=\sum_{w\in S\setminus\{x\}}} \lambda_w s_w \qquad (\text{since } x\in S)\\
&= \underbrace{\lambda_x\left(p_x+(s_x-p_x)\right)}_{=\lambda_x p_x+\lambda_x(s_x-p_x)} + \sum_{w\in S\setminus\{x\}} \lambda_w \underbrace{s_w}_{\substack{\in\sum_{v\in W\setminus\{x\}}\mathbf{k}p_v\\ (\text{by (13.152.34)})}}\\
&\in \lambda_x p_x + \lambda_x \underbrace{(s_x-p_x)}_{\substack{\in\sum_{v\in W\setminus\{x\}}\mathbf{k}p_v\\ (\text{by (13.152.35)})}} + \underbrace{\sum_{w\in S\setminus\{x\}}\lambda_w \sum_{v\in W\setminus\{x\}}\mathbf{k}p_v}_{\substack{\subset\sum_{v\in W\setminus\{x\}}\mathbf{k}p_v\\ (\text{since } \sum_{v\in W\setminus\{x\}}\mathbf{k}p_v \text{ is a } \mathbf{k}\text{-module})}}\\
&\subset \lambda_x p_x + \underbrace{\lambda_x \sum_{v\in W\setminus\{x\}}\mathbf{k}p_v + \sum_{v\in W\setminus\{x\}}\mathbf{k}p_v}_{\substack{\subset\sum_{v\in W\setminus\{x\}}\mathbf{k}p_v\\ (\text{since } \sum_{v\in W\setminus\{x\}}\mathbf{k}p_v \text{ is a } \mathbf{k}\text{-module})}} \subset \lambda_x p_x + \sum_{v\in W\setminus\{x\}}\mathbf{k}p_v .
\end{aligned}$$

Lemma 13.152.2 (applied to $\lambda=\lambda_x$) thus shows that $\lambda_x = 0$. Thus,

$$0 = \underbrace{\lambda_x}_{=0} s_x + \underbrace{\sum_{\substack{w\in S;\\ w\neq x}}}_{=\sum_{w\in S\setminus\{x\}}} \lambda_w s_w = \underbrace{0 s_x}_{=0} + \sum_{w\in S\setminus\{x\}}\lambda_w s_w = \sum_{w\in S\setminus\{x\}}\lambda_w s_w .$$

Thus, the family $(\lambda_w)_{w\in S\setminus\{x\}} \in \mathbf{k}^{S\setminus\{x\}}$ satisfies $\sum_{w\in S\setminus\{x\}}\lambda_w s_w = 0$. Hence, $(\lambda_w)_{w\in S\setminus\{x\}} = (0)_{w\in S\setminus\{x\}}$ (according to (13.152.33), applied to $(\mu_w)_{w\in S\setminus\{x\}} = (\lambda_w)_{w\in S\setminus\{x\}}$). In other words,

$$\lambda_w = 0 \qquad \text{for every } w\in S\setminus\{x\}. \tag{13.152.36}$$

Combining this with the fact that $\lambda_x = 0$, we conclude that $\lambda_w = 0$ for every $w\in S$. In other words, $(\lambda_w)_{w\in S} = (0)_{w\in S}$.

Now, $w\in S\subset L\subset W$. Hence, (13.152.28) yields

$$\begin{aligned}
s_w &\in \underbrace{p_w}_{\in\sum_{v\in W\setminus\{x\}}\mathbf{k}p_v} + \underbrace{\sum_{\substack{v\in W;\\ v>w}}}_{=\sum_{v\in\{q\in W\ \mid\ q>w\}}}\mathbf{k}p_v \subset \sum_{v\in W\setminus\{x\}}\mathbf{k}p_v + \underbrace{\sum_{v\in\{q\in W\ \mid\ q>w\}}\mathbf{k}p_v}_{\subset\sum_{v\in W\setminus\{x\}}\mathbf{k}p_v}\\
&\subset \sum_{v\in W\setminus\{x\}}\mathbf{k}p_v + \sum_{v\in W\setminus\{x\}}\mathbf{k}p_v \subset \sum_{v\in W\setminus\{x\}}\mathbf{k}p_v
\end{aligned}$$

(since $\sum_{v\in W\setminus\{x\}}\mathbf{k}p_v$ is a $\mathbf{k}$-module). This proves (13.152.34).

[1077] *Proof of (13.152.35):* Let $v\in\{q\in W\ \mid\ q>x\}$. We shall show that $v\in W\setminus\{x\}$.

Indeed, we have $v\in\{q\in W\ \mid\ q>x\}$. In other words, v is an element of W and satisfies $v>x$. Hence, $v\neq x$ (since $v>x$). Combining $v\in W$ with $v\neq x$, we obtain $v\in W\setminus\{x\}$.

Let us now forget that we fixed v. We thus have proven that every $v\in\{q\in W\ \mid\ q>x\}$ satisfies $v\in W\setminus\{x\}$. In other words, $\{q\in W\ \mid\ q>x\}\subset W\setminus\{x\}$. Therefore, $\sum_{v\in\{q\in W\ \mid\ q>x\}}\mathbf{k}p_v \subset \sum_{v\in W\setminus\{x\}}\mathbf{k}p_v$.

Now, $x\in S\subset L\subset W$. Hence, (13.152.28) (applied to $w=x$) yields

$$s_x \in p_x + \sum_{\substack{v\in W;\\ v>x}}\mathbf{k}p_v .$$

Subtracting p_x from both sides of this relation, we obtain

$$s_x - p_x \in \underbrace{\sum_{\substack{v\in W;\\ v>x}}}_{=\sum_{v\in\{q\in W\ \mid\ q>x\}}}\mathbf{k}p_v = \sum_{v\in\{q\in W\ \mid\ q>x\}}\mathbf{k}p_v \subset \sum_{v\in W\setminus\{x\}}\mathbf{k}p_v .$$

This proves (13.152.35).

Now, let us forget that we fixed $(\lambda_w)_{w\in S}$. We thus have shown that if $(\lambda_w)_{w\in S} \in \mathbf{k}^S$ is a family of elements of $\mathbf{k}$ such that $\sum_{w\in S}\lambda_w s_w = 0$, then $(\lambda_w)_{w\in S} = (0)_{w\in S}$. In other words, the family $(s_w)_{w\in S}$ is $\mathbf{k}$-linearly independent.

Let us now forget that we fixed S. We thus have proven that if S is a finite subset of L satisfying $|S| = K$, then the family $(s_w)_{w\in S}$ is $\mathbf{k}$-linearly independent. In other words, (13.152.30) holds in the case when $|S| = K$. This completes the induction step. Thus, we have proven (13.152.30) by induction.

Now, a family $\mathfrak{f}$ of vectors in a $\mathbf{k}$-module is $\mathbf{k}$-linearly independent if every finite subfamily of $\mathfrak{f}$ is $\mathbf{k}$-linearly independent (because every linear dependence relation for $\mathfrak{f}$ has only finitely many nonzero coefficients, and thus can be recast as a linear dependence relation for some finite subfamily of $\mathfrak{f}$). Now, (13.152.30) shows that every finite subfamily of the family $(s_w)_{w\in L}$ is $\mathbf{k}$-linearly independent; therefore, the previous sentence shows that the family $(s_w)_{w\in L}$ is $\mathbf{k}$-linearly independent. This proves Proposition 13.152.1. □

Let us now return to the solution of Exercise 6.1.41(d). The set $\mathfrak{A}^*$ is totally ordered (by the lexicographic order), and the set $\mathfrak{L}$ is a subset of $\mathfrak{A}^*$. The family $(x_w)_{w\in\mathfrak{A}^*}$ is a basis of the $\mathbf{k}$-module $T(V)$, and thus is a $\mathbf{k}$-linearly independent family of elements of this $\mathbf{k}$-module. The family $(b_w)_{w\in\mathfrak{L}}$ is a family of elements of $T(V)$. Every $w \in \mathfrak{L}$ satisfies

$$b_w \in x_w + \underbrace{\sum_{\substack{v\in\mathfrak{A}^{\ell(w)};\\ v>w}} \mathbf{k}x_v}_{\substack{\subset \sum_{\substack{v\in\mathfrak{A}^*;\\ v>w}} \mathbf{k}x_v \\ (\text{since } \mathfrak{A}^{\ell(w)}\subset\mathfrak{A}^*)}} \qquad (\text{by Exercise 6.1.41(c)})$$
$$\subset x_w + \sum_{\substack{v\in\mathfrak{A}^*;\\ v>w}} \mathbf{k}x_v.$$

Hence, Proposition 13.152.1 (applied to $\mathfrak{V} = T(V)$, $W = \mathfrak{A}^*$, $(p_w)_{w\in\mathfrak{A}^*} = (x_w)_{w\in\mathfrak{A}^*}$, $L = \mathfrak{L}$ and $(s_w)_{w\in\mathfrak{L}} = (b_w)_{w\in\mathfrak{L}}$) shows that the family $(b_w)_{w\in\mathfrak{L}}$ is $\mathbf{k}$-linearly independent. Combining this with the fact that this family $(b_w)_{w\in\mathfrak{L}}$ spans the $\mathbf{k}$-module $\mathfrak{g}$, we therefore conclude that the family $(b_w)_{w\in\mathfrak{L}}$ is a basis of the $\mathbf{k}$-module $\mathfrak{g}$. This solves Exercise 6.1.41(d).

(e) Let us first show a simple lemma:

Lemma 13.152.3. *Let $\mathfrak{a}$ and $\mathfrak{b}$ be two $\mathbf{k}$-Lie algebras. Let $p : \mathfrak{a} \to \mathfrak{b}$ and $q : \mathfrak{a} \to \mathfrak{b}$ be two Lie algebra homomorphisms. Then, $\ker(p-q)$ is a Lie subalgebra of $\mathfrak{a}$.*

Proof of Lemma 13.152.3. Let $x \in \ker(p-q)$ and $y \in \ker(p-q)$. Then, $(p-q)(x) = 0$ (since $x \in \ker(p-q)$), so that $0 = (p-q)(x) = p(x) - q(x)$, and thus $p(x) = q(x)$. The same argument (applied to y instead of x) shows that $p(y) = q(y)$.

But p is a Lie algebra homomorphism, and thus satisfies $p([x,y]) = \left[\underbrace{p(x)}_{=q(x)}, \underbrace{p(y)}_{=q(y)}\right] = [q(x), q(y)] = q([x,y])$ (since q is a Lie algebra homomorphism). Now, $(p-q)([x,y]) = \underbrace{p([x,y])}_{=q([x,y])} - q([x,y]) = q([x,y]) - q([x,y]) = 0$. In other words, $[x,y] \in \ker(p-q)$.

Let us now forget that we fixed x and y. We thus have proven that $[x,y] \in \ker(p-q)$ whenever $x \in \ker(p-q)$ and $y \in \ker(p-q)$. In other words, the set $\ker(p-q)$ is closed under the Lie bracket. Also, clearly, $p-q$ is a $\mathbf{k}$-linear map (since both maps p and q are $\mathbf{k}$-linear), and therefore its kernel $\ker(p-q)$ is a $\mathbf{k}$-submodule of $\mathfrak{a}$. Thus, $\ker(p-q)$ is a $\mathbf{k}$-submodule of $\mathfrak{a}$ which is closed under the Lie bracket. In other words, $\ker(p-q)$ is a Lie subalgebra of $\mathfrak{a}$. This proves Lemma 13.152.3. □

Now, it is easy to see that if Ξ_1 and Ξ_2 are two Lie algebra homomorphisms $\Xi : \mathfrak{g} \to \mathfrak{h}$ such that every $a \in \mathfrak{A}$ satisfies $\Xi(x_a) = \xi(a)$, then $\Xi_1 = \Xi_2$ [1078]. In other words, there exists **at most one** Lie algebra

[1078] *Proof.* Let Ξ_1 and Ξ_2 be two Lie algebra homomorphisms $\Xi : \mathfrak{g} \to \mathfrak{h}$ such that every $a \in \mathfrak{A}$ satisfies $\Xi(x_a) = \xi(a)$. We must prove that $\Xi_1 = \Xi_2$.

homomorphism $\Xi : \mathfrak{g} \to \mathfrak{h}$ such that every $a \in \mathfrak{A}$ satisfies $\Xi(x_a) = \xi(a)$. We shall now show that there actually exists such a homomorphism.

For every $w \in \mathfrak{L}$, we define an element z_w of $\mathfrak{h}$ as follows: We define z_w by recursion on the length of w. If the length of w is 1 [1079], then we have $w = (a)$ for some letter $a \in \mathfrak{A}$, and we set $z_w = \xi(a)$ for this letter a. If the length of w is > 1, then we set $z_w = [z_u, z_v]$, where $(u, v) = \operatorname{stf} w$ [1080].

Thus, we have defined a $z_w \in \mathfrak{h}$ for every $w \in \mathfrak{L}$. Now, Exercise 6.1.41(d) shows that the family $(b_w)_{w\in\mathfrak{L}}$ is a basis of the $\mathbf{k}$-module $\mathfrak{g}$. Thus, we can define a $\mathbf{k}$-module homomorphism $f : \mathfrak{g} \to \mathfrak{h}$ by requiring that

$$(f(b_w) = z_w \qquad \text{for every } w \in \mathfrak{L}). \tag{13.152.37}$$

Consider this f. Whenever w is a Lyndon word of length > 1, we have

$$f([b_u, b_v]) = [f(b_u), f(b_v)], \qquad \text{where } (u, v) = \operatorname{stf} w \tag{13.152.38}$$

[1081]. But recall that the family $(b_w)_{w\in\mathfrak{L}}$ is a basis of the $\mathbf{k}$-module $\mathfrak{g}$. Thus, this family spans the $\mathbf{k}$-module $\mathfrak{g}$. In other words, $\mathfrak{g}$ is the $\mathbf{k}$-submodule of $\mathfrak{g}$ spanned by the family $(b_w)_{w\in\mathfrak{L}}$. Thus, Exercise 6.1.40(b) (applied to $B = \mathfrak{g}$) shows that f is a Lie algebra homomorphism.

We notice that

$$\text{every } a \in \mathfrak{A} \text{ satisfies } f(x_a) = \xi(a)$$

[1082]. Thus, f is a Lie algebra homomorphism $\mathfrak{g} \to \mathfrak{h}$ having the property that every $a \in \mathfrak{A}$ satisfies $f(x_a) = \xi(a)$. Therefore, there exists **at least one** Lie algebra homomorphism $\Xi : \mathfrak{g} \to \mathfrak{h}$ such that every $a \in \mathfrak{A}$ satisfies $\Xi(x_a) = \xi(a)$ (namely, $\Xi = f$). Combining this with the fact that there exists **at most one**

Both Ξ_1 and Ξ_2 are $\mathbf{k}$-linear maps, and therefore $\Xi_1 - \Xi_2$ is a $\mathbf{k}$-linear map as well. Hence, its kernel $\ker(\Xi_1 - \Xi_2)$ is a $\mathbf{k}$-submodule of $\mathfrak{g}$.

We know that Ξ_1 is a Lie algebra homomorphism $\Xi : \mathfrak{g} \to \mathfrak{h}$ such that every $a \in \mathfrak{A}$ satisfies $\Xi(x_a) = \xi(a)$. Thus, every $a \in \mathfrak{A}$ satisfies $\Xi_1(x_a) = \xi(a)$. Similarly, every $a \in \mathfrak{A}$ satisfies $\Xi_2(x_a) = \xi(a)$. Hence, every $a \in \mathfrak{A}$ satisfies $(\Xi_1 - \Xi_2)(x_a) = \underbrace{\Xi_1(x_a)}_{=\xi(a)} - \underbrace{\Xi_2(x_a)}_{=\xi(a)} = \xi(a) - \xi(a) = 0$, so that $x_a \in \ker(\Xi_1 - \Xi_2)$. In other words, the set $\ker(\Xi_1 - \Xi_2)$ contains x_a for every $a \in \mathfrak{A}$. Since $\ker(\Xi_1 - \Xi_2)$ is a $\mathbf{k}$-submodule of $\mathfrak{g}$, this shows that

$$\ker(\Xi_1 - \Xi_2) \supset \left(\text{the } \mathbf{k}\text{-linear span of the family } (x_a)_{a\in\mathfrak{A}}\right).$$

Since $\left(\text{the } \mathbf{k}\text{-linear span of the family } (x_a)_{a\in\mathfrak{A}}\right) = V$ (because the family $(x_a)_{a\in\mathfrak{A}}$ is a basis of the $\mathbf{k}$-module V), this rewrites as $\ker(\Xi_1 - \Xi_2) \supset V$. In other words, $V \subset \ker(\Xi_1 - \Xi_2)$.

From Lemma 13.152.3 (applied to $\mathfrak{a} = \mathfrak{g}$, $\mathfrak{b} = \mathfrak{h}$, $p = \Xi_1$ and $q = \Xi_2$), we see that $\ker(\Xi_1 - \Xi_2)$ is a Lie subalgebra of $\mathfrak{g}$. Since $\mathfrak{g}$ (in turn) is a Lie subalgebra of $T(V)$, this shows that $\ker(\Xi_1 - \Xi_2)$ is a Lie subalgebra of $T(V)$.

Thus, we know that $\ker(\Xi_1 - \Xi_2)$ is a Lie subalgebra of $T(V)$ satisfying $V \subset \ker(\Xi_1 - \Xi_2)$. Exercise 6.1.41(b) (applied to $\mathfrak{k} = \ker(\Xi_1 - \Xi_2)$) thus shows that $\mathfrak{g} \subset \ker(\Xi_1 - \Xi_2)$. Hence, $\Xi_1 - \Xi_2 = 0$, so that $\Xi_1 = \Xi_2$. Qed.

[1079] The length of any $w \in \mathfrak{L}$ must be at least 1. (Indeed, if $w \in \mathfrak{L}$, then the word w is Lyndon and thus nonempty, and hence its length must be at least 1.)

[1080] This is well-defined, because z_u and z_v have already been defined. [*Proof.* Let $(u, v) = \operatorname{stf} w$. Then, Exercise 6.1.39(e) (applied to $(g, h) = (u, v)$) shows that $u \in \mathfrak{L}$, $v \in \mathfrak{L}$, $\ell(u) < \ell(w)$ and $\ell(v) < \ell(w)$. Recall that we are defining z_w by recursion on the length of w. Hence, z_p is already defined for every $p \in \mathfrak{L}$ satisfying $\ell(p) < \ell(w)$. Applying this to $p = u$, we see that z_u is already defined (since $u \in \mathfrak{L}$ and $\ell(u) < \ell(w)$). The same argument (but applied to v instead of u) shows that z_v is already defined. Hence, z_u and z_v have already been defined. Thus, z_w is well-defined by $z_w = [z_u, z_v]$, qed.]

[1081] *Proof of (13.152.38):* Let w be a Lyndon word of length > 1. Let $(u, v) = \operatorname{stf} w$. Thus, $(u, v) = \operatorname{stf} w \in \mathfrak{L} \times \mathfrak{L}$.

The recursive definition of z_w shows that $z_w = [z_u, z_v]$ (since w is a Lyndon word of length > 1, and since $(u, v) = \operatorname{stf} w$). The recursive definition of b_w shows that $b_w = [b_u, b_v]$ (for the same reasons). Thus, $[b_u, b_v] = b_w$, so that

$$\begin{aligned} f\left(\underbrace{[b_u, b_v]}_{=b_w}\right) &= f(b_w) = z_w \qquad (\text{by } (13.152.37)) \\ &= [z_u, z_v]. \end{aligned}$$

Comparing this with

$$\left[\underbrace{f(b_u)}_{\substack{=z_u \\ (\text{by } (13.152.37), \text{ applied to } u \text{ instead of } w)}}, \underbrace{f(b_v)}_{\substack{=z_v \\ (\text{by } (13.152.37), \text{ applied to } v \text{ instead of } w)}}\right] = [z_u, z_v],$$

we obtain $f([b_u, b_v]) = [f(b_u), f(b_v)]$. This proves (13.152.38).

[1082] *Proof.* Let $a \in \mathfrak{A}$. Let w be the one-letter word (a). Then, w is a Lyndon word (since w is a one-letter word) and has length 1. Thus, the definition of z_w shows that $z_w = \xi(a)$ (since $w = (a)$).

Lie algebra homomorphism $\Xi : \mathfrak{g} \to \mathfrak{h}$ such that every $a \in \mathfrak{A}$ satisfies $\Xi(x_a) = \xi(a)$, we conclude that there exists a **unique** Lie algebra homomorphism $\Xi : \mathfrak{g} \to \mathfrak{h}$ such that every $a \in \mathfrak{A}$ satisfies $\Xi(x_a) = \xi(a)$. This solves Exercise 6.1.41(e).

13.153. **Solution to Exercise 6.2.7.** *Solution to Exercise 6.2.7.*

Proof of Remark 6.2.6. (a) Let I and J be two nonempty intervals of $\mathbb{Z}$ satisfying $I < J$. Then,

$$\text{every } i \in I \text{ and } j \in J \text{ satisfy } i < j \qquad (13.153.1)$$

(by the definition of $I < J$), since $I < J$.

Let $p \in I \cap J$. Then, $p \in I \cap J \subset I$ and $p \in I \cap J \subset J$. Hence, $p < p$ (by (13.153.1)), which is absurd. Now, let us forget that we fixed p. Thus, we have obtained a contradiction for every $p \in I \cap J$. Hence, there exists no $p \in I \cap J$. In other words, $I \cap J = \varnothing$, so that the sets I and J are disjoint. This proves Remark 6.2.6(a).

(b) Let I and J be two disjoint nonempty intervals of $\mathbb{Z}$. We need to prove that $I < J$ or $J < I$.

Let i_0 be the smallest element of I (this exists, since I is nonempty), and let j_0 be the smallest element of J (this exists, since J is nonempty). We WLOG assume that $i_0 \leq j_0$ (since otherwise, we can simply interchange I with J).

The intervals I and J are disjoint, and thus $I \cap J = \varnothing$.

Now, let $i \in I$ and $j \in J$ be arbitrary. Assume (for the sake of contradiction) that $i \geq j$. Notice that $j \geq j_0$ (since j is an element of J, whereas j_0 is the smallest element of J), so that $i \geq j \geq j_0$, so that $j_0 \leq i$.

Write the interval I in the form $[p : q]^+$ for some $p \in \mathbb{Z}$ and $q \in \mathbb{Z}$. Since $i \in I = [p : q]^+ = \{p+1, p+2, \ldots, q\}$, we have $p < i \leq q$. Since $i_0 \in I = [p : q]^+ = \{p+1, p+2, \ldots, q\}$, we have $p < i_0 \leq q$. Now, $p < i_0 \leq j_0$ and $j_0 \leq i \leq q$. Hence, $p < j_0 \leq q$ and thus $j_0 \in \{p+1, p+2, \ldots, q\} = [p : q]^+ = I$. Combined with $j_0 \in J$ (since j_0 is the smallest element of J), this yields $j_0 \in I \cap J = \varnothing$, which is absurd. Hence, our assumption (that $i \geq j$) was wrong. We thus have $i < j$.

Now, forget that we have fixed i and j. We thus have shown that every $i \in I$ and $j \in J$ satisfy $i < j$. In other words, $I < J$ (by the definition of $I < J$). Hence, $I < J$ or $J < I$. This proves Remark 6.2.6(b).

(c) For any ℓ-tuple $(I_1, I_2, \ldots, I_\ell)$ of nonempty intervals of $\mathbb{Z}$, we can state the following three properties (which might and might not be satisfied):

- *Property C1:* The intervals I_1, I_2, ..., I_ℓ form a set partition of the set $[0 : n]^+$, where $n = |\alpha|$.
- *Property C2:* We have $I_1 < I_2 < \cdots < I_\ell$.
- *Property C3:* We have $|I_i| = \alpha_i$ for every $i \in \{1, 2, \ldots, \ell\}$.

We have to prove that the interval system $\operatorname{intsys} \alpha$ is the unique ℓ-tuple $(I_1, I_2, \ldots, I_\ell)$ of nonempty intervals of $\mathbb{Z}$ satisfying these three properties C1, C2 and C3.

But the definition of b_w yields $b_w = x_a$ (since $\ell(w) = 1$ and $w = (a)$). Hence, $f\left(\underbrace{b_w}_{=x_a}\right) = f(x_a)$, so that $f(x_a) = f(b_w) = z_w$ (by (13.152.37)) and thus $f(x_a) = z_w = \xi(a)$, qed.

First, it is easy to check that the interval system $\operatorname{intsys}\alpha$ is an ℓ-tuple $(I_1, I_2, \ldots, I_\ell)$ of nonempty intervals of $\mathbb{Z}$ satisfying these three properties C1, C2 and C3.[1083] It remains to prove that it is the only such ℓ-tuple.

So, let us fix any ℓ-tuple $(I_1, I_2, \ldots, I_\ell)$ of nonempty intervals of $\mathbb{Z}$ satisfying the three properties C1, C2 and C3. We need to prove that this ℓ-tuple $(I_1, I_2, \ldots, I_\ell)$ is $\operatorname{intsys}\alpha$. In order to prove this, it is enough to show that

$$I_i = \left[\sum_{k=1}^{i-1} \alpha_k : \sum_{k=1}^{i} \alpha_k\right]^+ \qquad \text{for every } i \in \{1, 2, \ldots, \ell\} \tag{13.153.3}$$

(according to the definition of $\operatorname{intsys}\alpha$). So it remains to prove (13.153.3).

Set $n = |\alpha|$. The intervals I_1, I_2, $\ldots$, I_ℓ form a set partition of the set $[0 : n]^+$ (according to Property C1). Thus, the intervals I_1, I_2, $\ldots$, I_ℓ are disjoint, and satisfy $I_1 \cup I_2 \cup \cdots \cup I_\ell = [0 : n]^+$.

Now, let us show that

$$I_1 \cup I_2 \cup \cdots \cup I_u = \left[0 : \sum_{k=1}^{u} \alpha_k\right]^+ \qquad \text{for every } u \in \{0, 1, \ldots, \ell\}. \tag{13.153.4}$$

Proof of (13.153.4): We will prove (13.153.4) by induction over u.

[1083] *Proof.* Let $(I_1, I_2, \ldots, I_\ell)$ denote the interval system $\operatorname{intsys}\alpha$. We need to prove that the Properties C1, C2 and C3 are satisfied.

Let us first recall that

$$I_i = \left[\sum_{k=1}^{i-1} \alpha_k : \sum_{k=1}^{i} \alpha_k\right]^+ \qquad \text{for every } i \in \{1, 2, \ldots, \ell\} \tag{13.153.2}$$

(by the definition of $\operatorname{intsys}\alpha$).

Proof that Property C1 is satisfied: Let $n = |\alpha|$. Then, $\sum_{k=1}^{\ell} \alpha_k = |\alpha| = n$. Clearly, $I_i \subset [0 : n]^+$ for every $i \in \{1, 2, \ldots, \ell\}$. We have

$$0 = \sum_{k=1}^{0} \alpha_k \leq \sum_{k=1}^{1} \alpha_k \leq \cdots \leq \sum_{k=1}^{\ell} \alpha_k = n$$

(since α_1, α_2, $\ldots$, α_ℓ are positive integers). Hence, for every $x \in [0 : n]^+$, there exists precisely one $i \in \{1, 2, \ldots, \ell\}$ satisfying $\sum_{k=1}^{i-1} \alpha_k < x \leq \sum_{k=1}^{i} \alpha_k$. In other words, for every $x \in [0 : n]^+$, there exists precisely one $i \in \{1, 2, \ldots, \ell\}$ satisfying $x \in \left[\sum_{k=1}^{i-1} \alpha_k : \sum_{k=1}^{i} \alpha_k\right]^+$ (since $x \in \left[\sum_{k=1}^{i-1} \alpha_k : \sum_{k=1}^{i} \alpha_k\right]^+$ is equivalent to $\sum_{k=1}^{i-1} \alpha_k < x \leq \sum_{k=1}^{i} \alpha_k$). In other words, for every $x \in [0 : n]^+$, there exists precisely one $i \in \{1, 2, \ldots, \ell\}$ satisfying $x \in I_i$ (since $I_i = \left[\sum_{k=1}^{i-1} \alpha_k : \sum_{k=1}^{i} \alpha_k\right]^+$). In other words, the subsets I_1, I_2, $\ldots$, I_ℓ of $[0 : n]^+$ are disjoint, and their union is $[0 : n]^+$. In other words, the subsets I_1, I_2, $\ldots$, I_ℓ of $[0 : n]^+$ form a set partition of the set $[0 : n]^+$. This proves that Property C1 is satisfied.

Proof that Property C2 is satisfied: Let $u \in \{1, 2, \ldots, \ell - 1\}$. Let $i \in I_u$ and $j \in I_{u+1}$. Since $i \in I_u = \left[\sum_{k=1}^{u-1} \alpha_k : \sum_{k=1}^{u} \alpha_k\right]^+$ (by (13.153.2), applied to u instead of i), we have $\sum_{k=1}^{u-1} \alpha_k < i \leq \sum_{k=1}^{u} \alpha_k$. Since $j \in I_{u+1} = \left[\sum_{k=1}^{(u+1)-1} \alpha_k : \sum_{k=1}^{u+1} \alpha_k\right]^+$ (by (13.153.2), applied to $u + 1$ instead of i), we have $\sum_{k=1}^{(u+1)-1} \alpha_k < j \leq \sum_{k=1}^{u+1} \alpha_k$. Now, $i \leq \sum_{k=1}^{u} \alpha_k = \sum_{k=1}^{(u+1)-1} \alpha_k < j$.

Now, let us forget that we fixed i and j. We thus have proven that every $i \in I_u$ and $j \in I_{u+1}$ satisfy $i < j$. In other words, $I_u < I_{u+1}$ (by the definition of $I_u < I_{u+1}$).

Now, let us forget that we fixed u. We thus have shown that $I_u < I_{u+1}$ for every $u \in \{1, 2, \ldots, \ell - 1\}$. In other words, $I_1 < I_2 < \cdots < I_\ell$. This proves that Property C2 is satisfied.

Proof that Property C3 is satisfied: Let $i \in \{1, 2, \ldots, \ell\}$. We have $\sum_{k=1}^{i} \alpha_k = \sum_{k=1}^{i-1} \alpha_k + \underbrace{\alpha_i}_{>0} > \sum_{k=1}^{i-1} \alpha_k$. Now, (13.153.2) yields

$$|I_i| = \left|\left[\sum_{k=1}^{i-1} \alpha_k : \sum_{k=1}^{i} \alpha_k\right]^+\right| = \sum_{k=1}^{i} \alpha_k - \sum_{k=1}^{i-1} \alpha_k \qquad \left(\text{since } \sum_{k=1}^{i} \alpha_k > \sum_{k=1}^{i-1} \alpha_k\right)$$
$$= \alpha_i.$$

This proves that Property C3 is satisfied.

We thus have shown that the Properties C1, C2 and C3 are satisfied, qed.

Induction base: For $u = 0$, we have $I_1 \cup I_2 \cup \cdots \cup I_u = I_1 \cup I_2 \cup \cdots \cup I_0 = (\text{empty union}) = \varnothing$ and $[0 : \sum_{k=1}^{u} \alpha_k]^+ = \left[0 : \underbrace{\sum_{k=1}^{0} \alpha_k}_{=0}\right]^+ = [0 : 0]^+ = \varnothing$. Hence, for $u = 0$, both sides of the equality (13.153.4) are $\varnothing$. Thus, for $u = 0$, the equality (13.153.4) holds. This completes the induction base.

Induction step: Let $U \in \{1, 2, \ldots, \ell\}$. Assume that (13.153.4) holds for $u = U - 1$. We now need to prove that (13.153.4) holds for $u = U$ as well.

We have assumed that (13.153.4) holds for $u = U - 1$. In other words,

$$I_1 \cup I_2 \cup \cdots \cup I_{U-1} = \left[0 : \sum_{k=1}^{U-1} \alpha_k\right]^+ . \tag{13.153.5}$$

Let $\xi = \sum_{k=1}^{U-1} \alpha_k$. Then, $\xi \geq 0$, so that $\xi + 1 \geq 1$. Then,

$$n = |\alpha| = \sum_{k=1}^{\ell} \alpha_k = \sum_{k=1}^{U-1} \alpha_k + \underbrace{\sum_{k=U}^{\ell} \alpha_k}_{\substack{>0 \\ (\text{since all } \alpha_k \text{ are } >0, \\ \text{and since } U \leq \ell)}} > \sum_{k=1}^{U-1} \alpha_k = \xi .$$

Hence, $n \geq \xi + 1$ (since ξ and n are integers), so that $1 \leq \xi + 1 \leq n$. In other words, $\xi + 1 \in \{1, 2, \ldots, n\} = [0 : n]^+ = I_1 \cup I_2 \cup \cdots \cup I_\ell$ (since $I_1 \cup I_2 \cup \cdots \cup I_\ell = [0 : n]^+$). In other words, there exists some $v \in \{1, 2, \ldots, \ell\}$ such that $\xi + 1 \in I_v$. Consider this v. If we had $v < U$, then we would have

$$\begin{aligned} \xi + 1 \in I_v \subset I_1 \cup I_2 \cup \cdots \cup I_{U-1} \qquad & (\text{since } v \in \{1, 2, \ldots, U - 1\} \ (\text{because } v < U)) \\ = \left[0 : \underbrace{\sum_{k=1}^{U-1} \alpha_k}_{=\xi}\right]^+ = [0 : \xi]^+ = \{1, 2, \ldots, \xi\} , & \end{aligned}$$

which is absurd. Hence, we cannot have $v < U$. Thus, we have $v \geq U$.

Recall that

$$\left[0 : \underbrace{\xi}_{=\sum_{k=1}^{U-1} \alpha_k}\right]^+ = \left[0 : \sum_{k=1}^{U-1} \alpha_k\right]^+ = I_1 \cup I_2 \cup \cdots \cup I_{U-1} \tag{13.153.6}$$

(by (13.153.5)). Using this, it is easy to see that

$$\text{every } p \in I_U \text{ satisfies } p \geq \xi + 1. \tag{13.153.7}$$

[1084]

We now assume (for the sake of contradiction) that $v \neq U$. Then, $v > U$ (since $v \geq U$ and $v \neq U$), whence $I_U < I_v$ (since Property C2 yields $I_1 < I_2 < \cdots < I_\ell$).

The interval I_U is nonempty, and thus there exists some $p \in I_U$. Consider such a p. Recall that $I_U < I_v$. Thus, every $i \in I_U$ and $j \in I_v$ satisfy $i < j$ (by the definition of $I_U < I_v$). Applying this to $i = p$ and $j = \xi + 1$, we obtain $p < \xi + 1$. But (13.153.7) yields $p \geq \xi + 1$, which contradicts $p < \xi + 1$. This contradiction proves that our assumption (that $v \neq U$) was wrong. Hence, we have $v = U$.

[1084] *Proof of (13.153.7):* Let $p \in I_U$. Assume (for the sake of contradiction) that $p \leq \xi$. But $p \in I_U \subset I_1 \cup I_2 \cup \cdots \cup I_\ell = [0 : n]^+ = \{1, 2, \ldots, n\}$, so that $0 < p \leq n$. Since $0 < p \leq \xi$, we have $p \in \{1, 2, \ldots, \xi\} = [0 : \xi]^+ = I_1 \cup I_2 \cup \cdots \cup I_{U-1}$, which shows that there exists some $r \in \{1, 2, \ldots, U - 1\}$ such that $p \in I_r$. Consider this r. Since $r \neq U$ (because $r \in \{1, 2, \ldots, U - 1\}$), the intervals I_r and I_U are disjoint (since the intervals I_1, I_2, ..., I_ℓ are disjoint). In other words, $I_r \cap I_U = \varnothing$. But combining $p \in I_r$ with $p \in I_U$, we obtain $p \in I_r \cap I_U = \varnothing$, which is absurd. This contradiction proves that our assumption (that $p \leq \xi$) was wrong. Hence, we have $p > \xi$. Thus, $p \geq \xi + 1$ (since p and ξ are integers). This proves (13.153.7).

Now, $\xi+1 \in I_v = I_U$ (since $v=U$). Hence, $\xi+1$ is an element of I_U. Due to (13.153.7), this element $\xi+1$ is the smallest element of I_U.

But since property C3 is satisfied, we have $|I_U| = \alpha_U$ (by Property C3, applied to $i=U$). So we know that the interval I_U has length α_U (since $|I_U| = \alpha_U$) and smallest element $\xi+1$. Therefore, $I_U = [\xi : \xi+\alpha_U]^+$ (because the only interval having length α_U and smallest element $\xi+1$ is the interval $[\xi : \xi+\alpha_U]^+$). Now,

$$I_1 \cup I_2 \cup \cdots \cup I_U = \underbrace{(I_1 \cup I_2 \cup \cdots \cup I_{U-1})}_{\substack{=[0:\xi]^+ \\ \text{(by (13.153.6))}}} \cup \underbrace{I_U}_{=[\xi:\xi+\alpha_U]^+}$$
$$= [0:\xi]^+ \cup [\xi : \xi+\alpha_U]^+ = [0 : \xi+\alpha_U]^+$$

(since $0 \le \xi \le \xi+\alpha_U$ (since $\xi \ge 0$ and $\alpha_U \ge 0$)). Since

$$\underbrace{\xi}_{=\sum_{k=1}^{U-1}\alpha_k} + \alpha_U = \sum_{k=1}^{U-1}\alpha_k + \alpha_U = \sum_{k=1}^{U}\alpha_k,$$

this rewrites as $I_1 \cup I_2 \cup \cdots \cup I_U = \left[0 : \sum_{k=1}^{U}\alpha_k\right]^+$. In other words, (13.153.4) holds for $u=U$. This completes the induction step. The induction proof of (13.153.4) is thus complete.

Proof of (13.153.3): Let $i \in \{1,2,\ldots,\ell\}$. Notice that $\sum_{k=1}^{i-1}\alpha_k \ge 0$ (since $\alpha_k > 0$ for every k) and $\sum_{k=1}^{i}\alpha_k = \sum_{k=1}^{i-1}\alpha_k + \underbrace{\alpha_i}_{>0} > \sum_{k=1}^{i-1}\alpha_k$. Hence, $0 \le \sum_{k=1}^{i-1}\alpha_k \le \sum_{k=1}^{i}\alpha_k$.

The intervals $I_1, I_2, \ldots, I_\ell$ are disjoint. Hence, I_i is disjoint from $I_1 \cup I_2 \cup \cdots \cup I_{i-1}$. Thus,

$$I_i = \underbrace{((I_1 \cup I_2 \cup \cdots \cup I_{i-1}) \cup I_i)}_{=I_1\cup I_2\cup\cdots\cup I_i} \setminus (I_1 \cup I_2 \cup \cdots \cup I_{i-1})$$
$$= \underbrace{(I_1 \cup I_2 \cup \cdots \cup I_i)}_{\substack{=\left[0:\sum_{k=1}^{i}\alpha_k\right]^+ \\ \text{(by (13.153.4), applied to } u=i)}} \setminus \underbrace{(I_1 \cup I_2 \cup \cdots \cup I_{i-1})}_{\substack{=\left[0:\sum_{k=1}^{i-1}\alpha_k\right]^+ \\ \text{(by (13.153.4), applied to } u=i-1)}}$$
$$= \left[0 : \sum_{k=1}^{i}\alpha_k\right]^+ \setminus \left[0 : \sum_{k=1}^{i-1}\alpha_k\right]^+ = \left[\sum_{k=1}^{i-1}\alpha_k : \sum_{k=1}^{i}\alpha_k\right]^+$$

(since $0 \le \sum_{k=1}^{i-1}\alpha_k \le \sum_{k=1}^{i}\alpha_k$). This proves (13.153.3). As explained above, this completes our proof of Remark 6.2.6(c). □

13.154. **Solution to Exercise 6.2.9.** *Solution to Exercise 6.2.9.*

Proof of Lemma 6.2.8. We have $\sigma \in \mathrm{Sh}_{n,m}$, so that $\sigma^{-1}(1) < \sigma^{-1}(2) < \cdots < \sigma^{-1}(n)$ and $\sigma^{-1}(n+1) < \sigma^{-1}(n+2) < \cdots < \sigma^{-1}(n+m)$. In other words, the restriction of the map σ^{-1} to the interval $[0:n]^+$ is strictly increasing, and so is the restriction of the map σ^{-1} to the interval $[n:n+m]^+$.

(a) Let I be an interval of $\mathbb{Z}$ such that $I \subset [0:n+m]^+$. We will only show that $\sigma(I) \cap [0:n]^+$ is an interval; the proof that $\sigma(I) \cap [n:n+m]^+$ is an interval is completely analogous.

It is known that

$$\left(\begin{array}{c}\text{if } \mathfrak{R} \text{ is a finite subset of } \mathbb{Z} \text{ such that every } \alpha \in \mathfrak{R},\ \gamma \in \mathfrak{R} \text{ and } \beta \in \mathbb{Z} \\ \text{satisfying } \alpha < \beta < \gamma \text{ satisfy } \beta \in \mathfrak{R}, \text{ then } \mathfrak{R} \text{ is an interval of } \mathbb{Z}\end{array}\right). \tag{13.154.1}$$

(Indeed, it is clear that $\mathfrak{R} = [\min\mathfrak{R} - 1 : \max\mathfrak{R}]^+$ in this case, unless $\mathfrak{R}$ is empty in which case the statement is obvious anyway.)

We now denote $\mathfrak{R} = \sigma(I) \cap [0:n]^+$. Our next goal is to use (13.154.1) to show that $\mathfrak{R}$ is an interval.

Indeed, let $\alpha \in \mathfrak{R}$, $\gamma \in \mathfrak{R}$ and $\beta \in \mathbb{Z}$ be such that $\alpha < \beta < \gamma$. Then, $\alpha \in \mathfrak{R} = \sigma(I) \cap [0:n]^+ \subset [0:n]^+$ and similarly $\gamma \in [0:n]^+$. Combined with $\alpha < \beta < \gamma$, these yield $\beta \in [0:n]^+$. But recall that the restriction of the map σ^{-1} to the interval $[0:n]^+$ is strictly increasing. Hence, from $\alpha < \beta < \gamma$, we obtain

$\sigma^{-1}(\alpha) < \sigma^{-1}(\beta) < \sigma^{-1}(\gamma)$ (since α, β and γ belong to $[0:n]^+$). In other words, the integer $\sigma^{-1}(\beta)$ lies strictly between the integers $\sigma^{-1}(\alpha)$ and $\sigma^{-1}(\gamma)$. Since $\sigma^{-1}(\alpha) \in I$ (because $\alpha \in \sigma(I) \cap [0:n]^+ \subset \sigma(I)$) and $\sigma^{-1}(\gamma) \in I$ (for similar reasons), this entails $\sigma^{-1}(\beta) \in I$ (because I is an interval, and thus any integer lying between two elements of I must also belong to I). Hence, $\beta \in \sigma(I)$. Combined with $\beta \in [0:n]^+$, this yields $\beta \in \sigma(I) \cap [0:n]^+ = \mathfrak{R}$.

Now, forget that we fixed α, γ and β. We thus have shown that every $\alpha \in \mathfrak{R}$, $\gamma \in \mathfrak{R}$ and $\beta \in \mathbb{Z}$ satisfying $\alpha < \beta < \gamma$ satisfy $\beta \in \mathfrak{R}$. Thus, (13.154.1) shows that $\mathfrak{R}$ is an interval of $\mathbb{Z}$. In other words, $\sigma(I) \cap [0:n]^+$ is an interval of $\mathbb{Z}$ (since $\mathfrak{R} = \sigma(I) \cap [0:n]^+$). This completes the proof of Lemma 6.2.8(a).

(b) The intervals K and L both are subsets of $[0:n]^+$. Therefore, from $K < L$, we obtain $\sigma^{-1}(K) < \sigma^{-1}(L)$ (because the restriction of the map σ^{-1} to the interval $[0:n]^+$ is strictly increasing).

Set $\mathcal{K} = \sigma^{-1}(K)$ and $\mathcal{L} = \sigma^{-1}(L)$. Then, $\mathcal{K}$ is a nonempty interval[1085], and thus can be written in the form $\mathcal{K} = [x_\mathcal{K} : y_\mathcal{K}]^+$ for two elements $x_\mathcal{K}$ and $y_\mathcal{K}$ of $[0:n+m]^+$ satisfying $x_\mathcal{K} < y_\mathcal{K}$. Consider these $x_\mathcal{K}$ and $y_\mathcal{K}$. Also, $\mathcal{L}$ is a nonempty interval[1086], and thus can be written in the form $\mathcal{L} = [x_\mathcal{L} : y_\mathcal{L}]^+$ for two elements $x_\mathcal{L}$ and $y_\mathcal{L}$ of $[0:n+m]^+$ satisfying $x_\mathcal{L} < y_\mathcal{L}$. Consider these $x_\mathcal{L}$ and $y_\mathcal{L}$. Since $[x_\mathcal{K} : y_\mathcal{K}]^+ = \mathcal{K} = \sigma^{-1}(K) < \sigma^{-1}(L) = \mathcal{L} = [x_\mathcal{L} : y_\mathcal{L}]^+$, we have $y_\mathcal{K} \leq x_\mathcal{L}$.

Notice that $\sigma(\mathcal{K}) = K$ (since $\mathcal{K} = \sigma^{-1}(K)$) and $\sigma(\mathcal{L}) = L$ (since $\mathcal{L} = \sigma^{-1}(L)$).

If we had $y_\mathcal{K} = x_\mathcal{L}$, then $\underbrace{\sigma^{-1}(K)}_{\substack{=\mathcal{K}=[x_\mathcal{K}:y_\mathcal{K}]^+=[x_\mathcal{K}:x_\mathcal{L}]^+ \\ (\text{since } y_\mathcal{K}=x_\mathcal{L})}} \cup \underbrace{\sigma^{-1}(L)}_{=\mathcal{L}=[x_\mathcal{L}:y_\mathcal{L}]^+} = [x_\mathcal{K} : x_\mathcal{L}]^+ \cup [x_\mathcal{L} : y_\mathcal{L}]^+ = [x_\mathcal{K} : y_\mathcal{L}]^+$ would be an interval, which would contradict the assumption that $\sigma^{-1}(K) \cup \sigma^{-1}(L)$ is not an interval. Hence, we cannot have $y_\mathcal{K} = x_\mathcal{L}$. Thus, $y_\mathcal{K} \neq x_\mathcal{L}$. Therefore, $y_\mathcal{K} < x_\mathcal{L}$ (since $y_\mathcal{K} \leq x_\mathcal{L}$). Hence, we can define a nonempty interval $\mathcal{P} \subset [0:n+m]^+$ by $\mathcal{P} = [y_\mathcal{K} : x_\mathcal{L}]^+$. Consider this $\mathcal{P}$. It satisfies $|\mathcal{P}| \neq 0$ (since it is nonempty) and $\mathcal{K} < \mathcal{P} < \mathcal{L}$ (since $\mathcal{K} = [x_\mathcal{K} : y_\mathcal{K}]^+$, $\mathcal{P} = [y_\mathcal{K} : x_\mathcal{L}]^+$ and $\mathcal{L} = [x_\mathcal{L} : y_\mathcal{L}]^+$), so that the sets $\mathcal{K}$, $\mathcal{P}$ and $\mathcal{L}$ are disjoint. As a consequence, the sets $\sigma(\mathcal{K})$, $\sigma(\mathcal{P})$ and $\sigma(\mathcal{L})$ are disjoint. In other words, the sets K, $\sigma(\mathcal{P})$ and L are disjoint (since $\sigma(\mathcal{K}) = K$ and $\sigma(\mathcal{L}) = L$).

It is easy to see that $\sigma(\mathcal{P}) \subset [n:n+m]^+$ [1087]. Thus, $\sigma(\mathcal{P}) \cap [n:n+m]^+ = \sigma(\mathcal{P})$. But Lemma 6.2.8(a) (applied to $\mathcal{P}$ instead of I) shows that $\sigma(\mathcal{P}) \cap [0:n]^+$ and $\sigma(\mathcal{P}) \cap [n:n+m]^+$ are intervals. In particular, $\sigma(\mathcal{P}) \cap [n:n+m]^+$ is an interval. In other words, $\sigma(\mathcal{P})$ is an interval (since $\sigma(\mathcal{P}) \cap [n:n+m]^+ = \sigma(\mathcal{P})$).

[1085] because $\mathcal{K} = \sigma^{-1}(K)$ and because we know that $\sigma^{-1}(K)$ is an interval and K is nonempty

[1086] because $\mathcal{L} = \sigma^{-1}(L)$ and because we know that $\sigma^{-1}(L)$ is an interval and L is nonempty

[1087] *Proof.* Assume the contrary. Then, there exists some $q \in \sigma(\mathcal{P})$ such that $q \notin [n:n+m]^+$. Consider this q. Since $q \notin [n:n+m]^+$, we must have $q \in [0:n]^+$.

Notice that $q \in \sigma(\mathcal{P})$, so that $\sigma^{-1}(q) \in \mathcal{P}$.

The elements $\max K$ and $\min L$ of K and L are well-defined, since K and L are nonempty.

Now, $\max K \leq q - 1$. (To prove this, assume the contrary. Thus, $\max K > q - 1$, so that $\max K \geq q$. But $\max K \in K \subset [0:n]^+$ and $q \in [0:n]^+$. Therefore, $\sigma^{-1}(\max K) \geq \sigma^{-1}(q)$ (because $\max K \geq q$, and since the restriction of the map σ^{-1} to the interval $[0:n]^+$ is strictly increasing). But since $\mathcal{K} < \mathcal{P}$, we have $\sigma^{-1}(\max K) < \sigma^{-1}(q)$ (since $\sigma^{-1}\left(\underbrace{\max K}_{\in K}\right) \in \sigma^{-1}(K) = \mathcal{K}$ and $\sigma^{-1}(q) \in \mathcal{P}$), which contradicts $\sigma^{-1}(\max K) \geq \sigma^{-1}(q)$. This contradiction shows that our assumption was wrong, and we have shown that $\max K \leq q - 1$.)

Furthermore, $q \leq \min L - 1$. (To prove this, assume the contrary. Thus, $q > \min L - 1$. Hence, $q \geq \min L$. We have $\min L \in L \subset [0:n]^+$ and $q \in [0:n]^+$. Therefore, $\sigma^{-1}(q) \geq \sigma^{-1}(\min L)$ (because $q \geq \min L$, and since the restriction of the map σ^{-1} to the interval $[0:n]^+$ is strictly increasing). But since $\mathcal{P} < \mathcal{L}$, we have $\sigma^{-1}(q) < \sigma^{-1}(\min L)$ (since $\sigma^{-1}(q) \in \mathcal{P}$ and $\sigma^{-1}\left(\underbrace{\min L}_{\in L}\right) \in \sigma^{-1}(L) = \mathcal{L}$), which contradicts $\sigma^{-1}(q) \geq \sigma^{-1}(\min L)$. This contradiction shows that our assumption was wrong, and we have shown that $q \leq \min L - 1$.)

So we have $\max K \leq \underbrace{q}_{\leq \min L - 1} - 1 \leq \min L - 2$. But K and L are disjoint nonempty intervals satisfying $K < L$, and their union is an interval again (because $K \cup L$ is an interval). Hence, the interval L must begin immediately after the end of the interval K; in other words, we must have $\max K = \min L - 1 > \min L - 2$. This contradicts $\max K \leq \min L - 2$. This contradiction completes our proof.

So we know that $\sigma(\mathcal{P}) \subset [n : n+m]^+$ is a nonempty interval[1088], and $\sigma^{-1}(\sigma(\mathcal{P}))$ is also an interval (since $\sigma^{-1}(\sigma(\mathcal{P})) = \mathcal{P}$). Moreover, we have $\sigma^{-1}(K) < \sigma^{-1}(\sigma(\mathcal{P}))$ (since $\sigma^{-1}(K) = \mathcal{K} < \mathcal{P} = \sigma^{-1}(\sigma(\mathcal{P}))$). Also, $\underbrace{\sigma^{-1}(K)}_{=\mathcal{K}=[x_{\mathcal{K}}:y_{\mathcal{K}}]^+} \cup \underbrace{\sigma^{-1}(\sigma(\mathcal{P}))}_{=\mathcal{P}=[y_{\mathcal{K}}:x_{\mathcal{L}}]^+} = [x_{\mathcal{K}} : y_{\mathcal{K}}]^+ \cup [y_{\mathcal{K}} : x_{\mathcal{L}}]^+ = [x_{\mathcal{K}} : x_{\mathcal{L}}]^+$ is an interval. Furthermore, $\sigma^{-1}(\sigma(\mathcal{P})) < \sigma^{-1}(L)$ (since $\sigma^{-1}(\sigma(\mathcal{P})) = \mathcal{P} < \mathcal{L} = \sigma^{-1}(L)$), and the set $\underbrace{\sigma^{-1}(\sigma(\mathcal{P}))}_{=\mathcal{P}=[y_{\mathcal{K}}:x_{\mathcal{L}}]^+} \cup \underbrace{\sigma^{-1}(L)}_{=\mathcal{L}=[x_{\mathcal{L}}:y_{\mathcal{L}}]^+} = [y_{\mathcal{K}} : x_{\mathcal{L}}]^+ \cup [x_{\mathcal{L}} : y_{\mathcal{L}}]^+ = [y_{\mathcal{K}} : y_{\mathcal{L}}]^+$ is an interval.

Altogether, we now know that $\sigma(\mathcal{P}) \subset [n : n+m]^+$ is a nonempty interval such that $\sigma^{-1}(\sigma(\mathcal{P}))$, $\sigma^{-1}(K) \cup \sigma^{-1}(\sigma(\mathcal{P}))$ and $\sigma^{-1}(\sigma(\mathcal{P})) \cup \sigma^{-1}(L)$ are intervals and such that $\sigma^{-1}(K) < \sigma^{-1}(\sigma(\mathcal{P})) < \sigma^{-1}(L)$. Thus, there exists a nonempty interval $P \subset [n : n+m]^+$ such that $\sigma^{-1}(P)$, $\sigma^{-1}(K) \cup \sigma^{-1}(P)$ and $\sigma^{-1}(P) \cup \sigma^{-1}(L)$ are intervals and such that $\sigma^{-1}(K) < \sigma^{-1}(P) < \sigma^{-1}(L)$ (namely, $P = \sigma(\mathcal{P})$). This proves Lemma 6.2.8(b).

(c) The proof of Lemma 6.2.8(c) is analogous to the proof of Lemma 6.2.8(b). □

13.155. **Solution to Exercise 6.2.11.** *Solution to Exercise 6.2.11.*

Proof of Lemma 6.2.10. We have $\sigma \in \operatorname{Sh}_{n,m}$, so that $\sigma^{-1}(1) < \sigma^{-1}(2) < \cdots < \sigma^{-1}(n)$ and $\sigma^{-1}(n+1) < \sigma^{-1}(n+2) < \cdots < \sigma^{-1}(n+m)$. In other words, the restriction of the map σ^{-1} to the interval $[0 : n]^+$ is strictly increasing, and so is the restriction of the map σ^{-1} to the interval $[n : n+m]^+$.

(a) Let I be an interval of $\mathbb{Z}$ satisfying either $I \subset [0 : n]^+$ or $I \subset [n : n+m]^+$. Assume that $\sigma^{-1}(I)$ is an interval.

Recall that the restriction of the map σ^{-1} to the interval $[0 : n]^+$ is strictly increasing, and so is the restriction of the map σ^{-1} to the interval $[n : n+m]^+$. Hence, the restriction of the map σ^{-1} to the interval I is strictly increasing (since either $I \subset [0 : n]^+$ or $I \subset [n : n+m]^+$).

Write the interval I in the form $I = [\alpha : \beta]^+$ where $0 \leq \alpha \leq \beta \leq n+m$. Write the interval $\sigma^{-1}(I)$ in the form $\sigma^{-1}(I) = [a : b]^+$ where $0 \leq a \leq b \leq n+m$. Since σ is bijective, we have $\left|\sigma^{-1}(I)\right| = |I| = \beta - \alpha$ (since $I = [\alpha : \beta]^+$). Compared with $\left|\sigma^{-1}(I)\right| = b - a$ (since $\sigma^{-1}(I) = [a : b]^+$), this yields $\beta - \alpha = b - a$.

The restriction of the map σ^{-1} to the interval I is injective; hence, it can be viewed as a bijection $I \to \sigma^{-1}(I)$. This bijection must be strictly increasing (since the restriction of the map σ^{-1} to the interval I is strictly increasing), and thus is a strictly increasing bijection $[\alpha : \beta]^+ \to [a : b]^+$ (since it goes from $I = [\alpha : \beta]^+$ to $\sigma^{-1}(I) = [a : b]^+$). But the only such bijection is the one sending every $x \in [\alpha : \beta]^+$ to $x - \alpha + a$. Hence, our bijection $I \to \sigma^{-1}(I)$ must be the map sending every $x \in [\alpha : \beta]^+$ to $x - \alpha + a$. Since our bijection comes from restricting the map σ^{-1}, it thus follows that the map σ^{-1} sends every $x \in [\alpha : \beta]^+$ to $x - \alpha + a$. Thus, $\sigma^{-1}(x) = x - \alpha + a$ for every $x \in [\alpha : \beta]^+$. Substituting y for $x - \alpha + a$ in this fact, we conclude that $\sigma^{-1}(y + \alpha - a) = y$ for every $y \in [a : \beta - \alpha + a]^+$. In other words, $\sigma^{-1}(y + \alpha - a) = y$ for every $y \in [a : b]^+$ (since $\beta - \alpha + a = b$ (because $\beta - \alpha = b - a$)). In other words, $\sigma(y) = y + \alpha - a$ for every $y \in [a : b]^+$. Thus,

$$(\sigma(a+1), \sigma(a+2), \ldots, \sigma(b)) = \left(\alpha+1, \alpha+2, \ldots, \underbrace{b + \alpha - a}_{\substack{=\beta \\ (\text{since } \beta-\alpha=b-a)}}\right) = (\alpha+1, \alpha+2, \ldots, \beta).$$

[1088] nonempty because $\mathcal{P}$ is nonempty

But let $w = (w_1, w_2, \ldots, w_{n+m})$ denote the word uv. The definition of $u \underset{\sigma}{\sqcup\!\sqcup} v$ then yields $u \underset{\sigma}{\sqcup\!\sqcup} v = \left(w_{\sigma(1)}, w_{\sigma(2)}, \ldots, w_{\sigma(n+m)}\right)$, so that

$$\begin{aligned}
&\underbrace{\left(u \underset{\sigma}{\sqcup\!\sqcup} v\right)}_{=\left(w_{\sigma(1)},w_{\sigma(2)},\ldots,w_{\sigma(n+m)}\right)} \left[\underbrace{\sigma^{-1}(I)}_{=[a:b]^+}\right] \\
&= \left(w_{\sigma(1)}, w_{\sigma(2)}, \ldots, w_{\sigma(n+m)}\right) \left[[a:b]^+\right] = \left(w_{\sigma(a+1)}, w_{\sigma(a+2)}, \ldots, w_{\sigma(b)}\right) \\
&= \left(w_{\alpha+1}, w_{\alpha+2}, \ldots, w_{\beta}\right) \qquad \left(\text{since } \left(\sigma(a+1), \sigma(a+2), \ldots, \sigma(b)\right) = (\alpha+1, \alpha+2, \ldots, \beta)\right) \\
&= \underbrace{w}_{=uv} \left[\underbrace{[\alpha:\beta]^+}_{=I}\right] = (uv)[I].
\end{aligned}$$

This proves Lemma 6.2.10(a).

(b) Notice that $\sigma^{-1}(I)$ is a nonempty interval (since I is nonempty and $\sigma^{-1}(I)$ is an interval). Hence, we can write the interval $\sigma^{-1}(I)$ in the form $[a:b]^+$ for some elements a and b of $[0:n+m]^+$ satisfying $a<b$. Consider these a and b. Similarly, write $\sigma^{-1}(J)$ in the form $[c:d]^+$ for some elements c and d of $[0:n+m]^+$ satisfying $c<d$. We have $b \leq c$ (since $\sigma^{-1}(I) < \sigma^{-1}(J)$), but we cannot have $b<c$ (because $\underbrace{[a:b]^+}_{=\sigma^{-1}(I)} \cup \underbrace{[c:d]^+}_{=\sigma^{-1}(J)} = \sigma^{-1}(I) \cup \sigma^{-1}(J)$ is an interval). Thus, we have $b=c$. Hence, $[b:d]^+ = [c:d]^+ = \sigma^{-1}(J)$ and $b=c<d$.

Now, let $A = [0:a]^+$ and $Z = [d:n+m]^+$. Then, the interval $[0:n+m]^+$ is the union of the disjoint intervals A, $\sigma^{-1}(I)$, $\sigma^{-1}(J)$ and Z (because

$$[0:n+m]^+ = \underbrace{[0:a]^+}_{=A} \sqcup \underbrace{[a:b]^+}_{=\sigma^{-1}(I)} \sqcup \underbrace{[b:d]^+}_{=\sigma^{-1}(J)} \sqcup \underbrace{[d:n+m]^+}_{=Z} = A \sqcup \sigma^{-1}(I) \sqcup \sigma^{-1}(J) \sqcup Z$$

), and these intervals satisfy $A < \sigma^{-1}(I) < \sigma^{-1}(J) < Z$ (since $A = [0:a]^+$, $\sigma^{-1}(I) = [a:b]^+$, $\sigma^{-1}(J) = [b:d]^+$ and $Z = [d:n+m]^+$). Therefore,

$$p = p[A] \cdot p\left[\sigma^{-1}(I)\right] \cdot p\left[\sigma^{-1}(J)\right] \cdot p[Z] \qquad \text{for every word } p \in \mathfrak{B}^{n+m} \tag{13.155.1}$$

for any alphabet $\mathfrak{B}$. Applying this to $p=\sigma$ and $\mathfrak{B} = \{1, 2, \ldots, n+m\}$, we obtain

$$\sigma = \sigma[A] \cdot \sigma\left[\sigma^{-1}(I)\right] \cdot \sigma\left[\sigma^{-1}(J)\right] \cdot \sigma[Z] \tag{13.155.2}$$

(where we consider the permutation σ as a word in $\{1, 2, \ldots, n+m\}^{n+m}$ by writing it in one-line notation).

Now, define a word τ by

$$\tau = \sigma[A] \cdot \sigma\left[\sigma^{-1}(J)\right] \cdot \sigma\left[\sigma^{-1}(I)\right] \cdot \sigma[Z]. \tag{13.155.3}$$

This word τ is obtained from the word σ by switching the two factors $\sigma\left[\sigma^{-1}(I)\right]$ and $\sigma\left[\sigma^{-1}(J)\right]$ (this is clear by comparing (13.155.3) with (13.155.2)), and thus is a permutation written in one-line notation (because σ is a permutation). In other words, $\tau \in \mathfrak{S}_{n+m}$.

From (13.155.3), we have

$$\begin{aligned}\tau &= \sigma\left[\underbrace{A}_{=[0:a]^+}\right]\cdot\sigma\left[\underbrace{\sigma^{-1}(J)}_{=[b:d]^+}\right]\cdot\sigma\left[\underbrace{\sigma^{-1}(I)}_{=[a:b]^+}\right]\cdot\sigma\left[\underbrace{Z}_{=[d:n+m]^+}\right]\\
&= \underbrace{\sigma\left[[0:a]^+\right]}_{=(\sigma(1),\sigma(2),\ldots,\sigma(a))}\cdot\underbrace{\sigma\left[[b:d]^+\right]}_{=(\sigma(b+1),\sigma(b+2),\ldots,\sigma(d))}\cdot\underbrace{\sigma\left[[a:b]^+\right]}_{=(\sigma(a+1),\sigma(a+2),\ldots,\sigma(b))}\cdot\underbrace{\sigma\left[[d:n+m]^+\right]}_{=(\sigma(d+1),\sigma(d+2),\ldots,\sigma(n+m))}\\
&= (\sigma(1),\sigma(2),\ldots,\sigma(a))\cdot(\sigma(b+1),\sigma(b+2),\ldots,\sigma(d))\\
&\qquad\cdot(\sigma(a+1),\sigma(a+2),\ldots,\sigma(b))\cdot(\sigma(d+1),\sigma(d+2),\ldots,\sigma(n+m))\\
&= (\sigma(1),\sigma(2),\ldots,\sigma(a),\sigma(b+1),\sigma(b+2),\ldots,\sigma(d),\\
&\qquad\sigma(a+1),\sigma(a+2),\ldots,\sigma(b),\sigma(d+1),\sigma(d+2),\ldots,\sigma(n+m)).\end{aligned}$$

Thus,

$$(\tau(1),\tau(2),\ldots,\tau(a)) = (\sigma(1),\sigma(2),\ldots,\sigma(a)); \tag{13.155.4}$$

$$(\tau(a+1),\tau(a+2),\ldots,\tau(a+d-b)) = (\sigma(b+1),\sigma(b+2),\ldots,\sigma(d)); \tag{13.155.5}$$

$$(\tau(a+d-b+1),\tau(a+d-b+2),\ldots,\tau(d)) = (\sigma(a+1),\sigma(a+2),\ldots,\sigma(b)); \tag{13.155.6}$$

$$(\tau(d+1),\tau(d+2),\ldots,\tau(n+m)) = (\sigma(d+1),\sigma(d+2),\ldots,\sigma(n+m)). \tag{13.155.7}$$

From this, it is easy to see that $\tau^{-1}(J) = [a:a+d-b]^+$ [1089] and $\tau^{-1}(I) = [a+d-b:d]^+$ [1090]. In particular, $\tau^{-1}(J)$ and $\tau^{-1}(I)$ are intervals. Now, obviously, the intervals $[0:a]^+$, $[a:a+d-b]^+$, $[a+d-b:d]^+$ and $[d:n+m]^+$ are disjoint intervals having union $[0:n+m]^+$ and satisfying $[0:a]^+ < [a:a+d-b]^+ < [a+d-b:d]^+ < [d:n+m]^+$. Since $A=[0:a]^+$, $\tau^{-1}(J) = [a:a+d-b]^+$, $\tau^{-1}(I) = [a+d-b:d]^+$ and $Z=[d:n+m]^+$, this rewrites as follows: The intervals A, $\tau^{-1}(J)$, $\tau^{-1}(I)$ and Z are disjoint intervals having union $[0:n+m]^+$ and satisfying $A<\tau^{-1}(J)<\tau^{-1}(I)<Z$. Therefore,

$$p = p[A]\cdot p\left[\tau^{-1}(J)\right]\cdot p\left[\tau^{-1}(I)\right]\cdot p[Z] \qquad \text{for every word } p\in\mathfrak{B}^{n+m} \tag{13.155.8}$$

for every alphabet $\mathfrak{B}$.

Next, we claim that τ belongs to $\operatorname{Sh}_{n,m}$. In fact, let i and j be two elements of $\{1,2,\ldots,n\}$ such that $i<j$. Our next goal is to prove that $\tau^{-1}(i)<\tau^{-1}(j)$.

Indeed, assume the contrary. Thus, $\tau^{-1}(i)\geq\tau^{-1}(j)$, so that $\tau^{-1}(i)>\tau^{-1}(j)$ (since τ is a permutation). In other words, the letter i lies further right than the letter j in the word τ. But we also have $\sigma^{-1}(i)<\sigma^{-1}(j)$ (since $\sigma^{-1}(1)<\sigma^{-1}(2)<\cdots<\sigma^{-1}(n)$ and $i<j$ and since $i,j\in\{1,2,\ldots,n\}$), which means that the letter i lies further left than the letter j in the word σ.

So the order in which the letters i and j appear in the word τ is different from that in σ. Since the word τ is obtained from the word σ by switching the two adjacent factors $\sigma\left[\sigma^{-1}(I)\right]$ and $\sigma\left[\sigma^{-1}(J)\right]$, this is only possible if one of the letters i and j is contained in one of these two factors and the other is contained in the other factor. Hence, this is what must be happening. In particular, one of the letters i and j must be contained in the factor $\sigma\left[\sigma^{-1}(J)\right]$. Since all letters of $\sigma\left[\sigma^{-1}(J)\right]$ belong to the set $[n:n+m]^+$ (because the letters of $\sigma\left[\sigma^{-1}(J)\right]$ are precisely the elements of J, but we have $J\subset[n:n+m]^+$), this yields that

[1089] In fact, this follows from

$$\begin{aligned}\tau\left(\underbrace{[a:a+d-b]^+}_{=\{a+1,a+2,\ldots,a+d-b\}}\right) &= \tau(\{a+1,a+2,\ldots,a+d-b\}) = \{\tau(a+1),\tau(a+2),\ldots,\tau(a+d-b)\}\\
&= \{\sigma(b+1),\sigma(b+2),\ldots,\sigma(d)\} \qquad \text{(by (13.155.5))}\\
&= \sigma\left(\underbrace{\{b+1,b+2,\ldots,d\}}_{=[b:d]^+=\sigma^{-1}(J)}\right) = \sigma\left(\sigma^{-1}(J)\right) = J.\end{aligned}$$

[1090] The proof of this is similar to that of $\tau^{-1}(J) = [a:a+d-b]^+$, but we have to use (13.155.6) this time.

one of the letters i and j must belong to the set $[n : n+m]^+$. But this is impossible, since the letters i and j belong to $\{1, 2, \ldots, n\}$ and thus neither of them can be an element of $[n : n+m]^+$ (because $[n : n+m]^+$ is disjoint with $\{1, 2, \ldots, n\}$). This contradiction shows that our assumption was wrong, and so we do have $\tau^{-1}(i) < \tau^{-1}(j)$.

Now, forget that we fixed i and j. We have shown that any two elements i and j of $\{1, 2, \ldots, n\}$ such that $i < j$ must satisfy $\tau^{-1}(i) < \tau^{-1}(j)$. Thus, $\tau^{-1}(1) < \tau^{-1}(2) < \cdots < \tau^{-1}(n)$. Similarly, $\tau^{-1}(n+1) < \tau^{-1}(n+2) < \cdots < \tau^{-1}(n+m)$. These two chains of inequalities, together, yield that $\tau \in \operatorname{Sh}_{n,m}$. Hence, $u \underset{\tau}{\shuffle} v$ is a well-defined element of the multiset $u \shuffle v$. Since $u \underset{\sigma}{\shuffle} v$ is the lexicographically highest element of this multiset, this shows that

$$u \underset{\sigma}{\shuffle} v \geq u \underset{\tau}{\shuffle} v. \tag{13.155.9}$$

Let $\mathfrak{a}$ denote the word $\left(u \underset{\tau}{\shuffle} v\right)[A]$, and let $\mathfrak{z}$ denote the word $\left(u \underset{\tau}{\shuffle} v\right)[Z]$.

We can now apply (13.155.1) to $p = u \underset{\sigma}{\shuffle} v$ and $\mathfrak{B} = \mathfrak{A}$. As a result, we obtain

$$u \underset{\sigma}{\shuffle} v = \left(u \underset{\sigma}{\shuffle} v\right)[A] \cdot \left(u \underset{\sigma}{\shuffle} v\right)\left[\sigma^{-1}(I)\right] \cdot \left(u \underset{\sigma}{\shuffle} v\right)\left[\sigma^{-1}(J)\right] \cdot \left(u \underset{\sigma}{\shuffle} v\right)[Z]. \tag{13.155.10}$$

Let now $(w_1, w_2, \ldots, w_{n+m})$ denote the word uv. The definition of $u \underset{\sigma}{\shuffle} v$ then yields $u \underset{\sigma}{\shuffle} v = \left(w_{\sigma(1)}, w_{\sigma(2)}, \ldots, w_{\sigma(n+m)}\right)$. Now, it is easy to see that

$$\left(u \underset{\sigma}{\shuffle} v\right)[A] = \mathfrak{a}$$

[1091] and

$$\left(u \underset{\sigma}{\shuffle} v\right)[Z] = \mathfrak{z}$$

[1092]. Thus, (13.155.10) becomes

$$\begin{aligned} u \underset{\sigma}{\shuffle} v &= \underbrace{\left(u \underset{\sigma}{\shuffle} v\right)[A]}_{=\mathfrak{a}} \cdot \underbrace{\left(u \underset{\sigma}{\shuffle} v\right)\left[\sigma^{-1}(I)\right]}_{\substack{=(uv)[I] \\ \text{(by (6.2.1))}}} \cdot \underbrace{\left(u \underset{\sigma}{\shuffle} v\right)\left[\sigma^{-1}(J)\right]}_{\substack{=(uv)[J] \\ \text{(by (6.2.1), applied to } J \\ \text{instead of } I)}} \cdot \underbrace{\left(u \underset{\sigma}{\shuffle} v\right)[Z]}_{=\mathfrak{z}} \\ &= \mathfrak{a} \cdot (uv)[I] \cdot (uv)[J] \cdot \mathfrak{z}. \end{aligned}$$

[1091] *Proof.* We have

$$\underbrace{\left(u \underset{\sigma}{\shuffle} v\right)}_{=\left(w_{\sigma(1)}, w_{\sigma(2)}, \ldots, w_{\sigma(n+m)}\right)} \left[\underbrace{A}_{=[0:a]^+}\right] = \left(w_{\sigma(1)}, w_{\sigma(2)}, \ldots, w_{\sigma(n+m)}\right)\left[[0:a]^+\right] = \left(w_{\sigma(1)}, w_{\sigma(2)}, \ldots, w_{\sigma(a)}\right).$$

The same argument, applied to τ instead of σ, shows that $\left(u \underset{\tau}{\shuffle} v\right)[A] = \left(w_{\tau(1)}, w_{\tau(2)}, \ldots, w_{\tau(a)}\right)$. But (13.155.4) yields $\left(w_{\tau(1)}, w_{\tau(2)}, \ldots, w_{\tau(a)}\right) = \left(w_{\sigma(1)}, w_{\sigma(2)}, \ldots, w_{\sigma(a)}\right)$, so that

$$\left(u \underset{\sigma}{\shuffle} v\right)[A] = \left(w_{\sigma(1)}, w_{\sigma(2)}, \ldots, w_{\sigma(a)}\right) = \left(w_{\tau(1)}, w_{\tau(2)}, \ldots, w_{\tau(a)}\right) = \left(u \underset{\tau}{\shuffle} v\right)[A] = \mathfrak{a},$$

qed.

[1092] *Proof.* We have

$$\underbrace{\left(u \underset{\sigma}{\shuffle} v\right)}_{=\left(w_{\sigma(1)}, w_{\sigma(2)}, \ldots, w_{\sigma(n+m)}\right)} \left[\underbrace{Z}_{=[d:n+m]^+}\right] = \left(w_{\sigma(1)}, w_{\sigma(2)}, \ldots, w_{\sigma(n+m)}\right)\left[[d:n+m]^+\right] = \left(w_{\sigma(d+1)}, w_{\sigma(d+2)}, \ldots, w_{\sigma(n+m)}\right).$$

The same argument, applied to τ instead of σ, shows that $\left(u \underset{\tau}{\shuffle} v\right)[Z] = \left(w_{\tau(d+1)}, w_{\tau(d+2)}, \ldots, w_{\tau(n+m)}\right)$. But (13.155.7) yields $\left(w_{\tau(d+1)}, w_{\tau(d+2)}, \ldots, w_{\tau(n+m)}\right) = \left(w_{\sigma(d+1)}, w_{\sigma(d+2)}, \ldots, w_{\sigma(n+m)}\right)$, so that

$$\left(u \underset{\sigma}{\shuffle} v\right)[Z] = \left(w_{\sigma(d+1)}, w_{\sigma(d+2)}, \ldots, w_{\sigma(n+m)}\right) = \left(w_{\tau(d+1)}, w_{\tau(d+2)}, \ldots, w_{\tau(n+m)}\right) = \left(u \underset{\tau}{\shuffle} v\right)[Z] = \mathfrak{z},$$

qed.

Thus,

$$\begin{aligned}
&\mathfrak{a}\cdot(uv)[I]\cdot(uv)[J]\cdot\mathfrak{z}\\
&=u\underset{\sigma}{\sqcup\!\sqcup}v\geq u\underset{\tau}{\sqcup\!\sqcup}v \qquad\qquad (\text{by } (13.155.9))\\
&=\underbrace{\left(u\underset{\tau}{\sqcup\!\sqcup}v\right)[A]}_{=\mathfrak{a}}\cdot\underbrace{\left(u\underset{\tau}{\sqcup\!\sqcup}v\right)\left[\tau^{-1}(J)\right]}_{\substack{=(uv)[J]\\ (\text{by } (6.2.1)\text{, applied to } \tau \text{ and } J\\ \text{instead of } \sigma \text{ and } I)}}\cdot\underbrace{\left(u\underset{\tau}{\sqcup\!\sqcup}v\right)\left[\tau^{-1}(I)\right]}_{\substack{=(uv)[I]\\ (\text{by } (6.2.1)\text{, applied to } \tau\\ \text{instead of } \sigma)}}\cdot\underbrace{\left(u\underset{\tau}{\sqcup\!\sqcup}v\right)[Z]}_{=\mathfrak{z}}\\
&\qquad\qquad\left(\text{by } (13.155.8)\text{, applied to } p=u\underset{\tau}{\sqcup\!\sqcup}v \text{ and } \mathfrak{B}=\mathfrak{A}\right)\\
&=\mathfrak{a}\cdot(uv)[J]\cdot(uv)[I]\cdot\mathfrak{z}.
\end{aligned}$$

In other words, $\mathfrak{a}\cdot(uv)[J]\cdot(uv)[I]\cdot\mathfrak{z}\leq\mathfrak{a}\cdot(uv)[I]\cdot(uv)[J]\cdot\mathfrak{z}$. Hence, Proposition 6.1.2(c) (applied to $\mathfrak{a}$, $(uv)[J]\cdot(uv)[I]\cdot\mathfrak{z}$ and $(uv)[I]\cdot(uv)[J]\cdot\mathfrak{z}$ instead of a, c and d) yields $(uv)[J]\cdot(uv)[I]\cdot\mathfrak{z}\leq(uv)[I]\cdot(uv)[J]\cdot\mathfrak{z}$. Thus, Proposition 6.1.2(d) (applied to $(uv)[J]\cdot(uv)[I]$, $\mathfrak{z}$, $(uv)[I]\cdot(uv)[J]$ and $\mathfrak{z}$ instead of a, b, c and d) yields $(uv)[J]\cdot(uv)[I]\leq(uv)[I]\cdot(uv)[J]$ (since $\ell((uv)[J]\cdot(uv)[I])=\ell((uv)[J])+\ell((uv)[I])=\ell((uv)[I])+\ell((uv)[J])=\ell((uv)[I]\cdot(uv)[J])$). In other words, $(uv)[I]\cdot(uv)[J]\geq(uv)[J]\cdot(uv)[I]$. This proves Lemma 6.2.10(b).

(c) The proof of Lemma 6.2.10(c) is analogous to that of Lemma 6.2.10(b). □

13.156. **Solution to Exercise 6.2.15.** *Solution to Exercise 6.2.15.*

Proof of Proposition 6.2.14. (a) Let $j\in\{1,2,\ldots,\ell\}$. We have $\sigma=\operatorname{iper}(\alpha,\tau)=\overrightarrow{I_{\tau(1)}}\overrightarrow{I_{\tau(2)}}\cdots\overrightarrow{I_{\tau(\ell)}}$ (in one-line notation). Therefore, the word $\overrightarrow{I_{\tau(j)}}$ appears as a factor in this word σ, starting at position $\sum_{k=1}^{j-1}\alpha_{\tau(k)}+1$ and ending at position $\sum_{k=1}^{j}\alpha_{\tau(k)}$. In other words, the letters of the word $\overrightarrow{I_{\tau(j)}}$ are the letters σ_j of σ for $j\in\left[\sum_{k=1}^{j-1}\alpha_{\tau(k)}:\sum_{k=1}^{j}\alpha_{\tau(k)}\right]^+$. Since the letters of the word $\overrightarrow{I_{\tau(j)}}$ are precisely the elements of $I_{\tau(j)}$, this rewrites as follows: The elements of $I_{\tau(j)}$ are the letters σ_j of σ for $j\in\left[\sum_{k=1}^{j-1}\alpha_{\tau(k)}:\sum_{k=1}^{j}\alpha_{\tau(k)}\right]^+$. In other words,

$$I_{\tau(j)}=\left\{\sigma_j\ \mid\ j\in\left[\sum_{k=1}^{j-1}\alpha_{\tau(k)}:\sum_{k=1}^{j}\alpha_{\tau(k)}\right]^+\right\}=\sigma\left(\left[\sum_{k=1}^{j-1}\alpha_{\tau(k)}:\sum_{k=1}^{j}\alpha_{\tau(k)}\right]^+\right).$$

Hence, $\sigma^{-1}\left(I_{\tau(j)}\right)=\left[\sum_{k=1}^{j-1}\alpha_{\tau(k)}:\sum_{k=1}^{j}\alpha_{\tau(k)}\right]^+$, so that Proposition 6.2.14(a) is proven.

(b) Let $j\in\{1,2,\ldots,\ell\}$. We need to show that the restriction of the map σ^{-1} to the interval $I_{\tau(j)}$ is increasing. In other words, we need to prove that the elements of $I_{\tau(j)}$ occur in increasing order in the word σ. But this is clear, because these elements all occur in the factor $\overrightarrow{I_{\tau(j)}}$ of the word σ, and this factor has them in increasing order (by its definition). This proves Proposition 6.2.14(b).

(c) Let $i\in\{1,2,\ldots,\ell\}$. Then, $\sigma^{-1}(I_i)=\sigma^{-1}\left(I_{\tau(\tau^{-1}(i))}\right)=\left[\sum_{k=1}^{\tau^{-1}(i)-1}\alpha_{\tau(k)},\sum_{k=1}^{\tau^{-1}(i)}\alpha_{\tau(k)}\right]^+$ (according to Proposition 6.2.14(a), applied to $j=\tau^{-1}(i)$). Hence, $\sigma^{-1}(I_i)$ is an interval. Furthermore, the restriction of the map σ^{-1} to the interval $I_i=I_{\tau(\tau^{-1}(i))}$ is increasing (according to Proposition 6.2.14(b), applied to $j=\tau^{-1}(i)$).

Now, forget that we fixed i. We thus have proven that every $i\in\{1,2,\ldots,\ell\}$ has the two properties that:

- the set $\sigma^{-1}(I_i)$ is an interval;
- the restriction of the map σ^{-1} to the interval I_i is increasing.

In other words, the permutation σ is α-clumping. Since $\sigma=\operatorname{iper}(\alpha,\tau)$, this shows that $\operatorname{iper}(\alpha,\tau)$ is α-clumping. Proposition 6.2.14(c) is proven.

(d) Let $i \in \{1, 2, \ldots, \ell - 1\}$. Then,

$$\sigma^{-1}\left(I_{\tau(i)}\right) = \left[\sum_{k=1}^{i-1} \alpha_{\tau(k)} : \sum_{k=1}^{i} \alpha_{\tau(k)}\right]^+ \tag{13.156.1}$$

(by Proposition 6.2.14(a), applied to $j = i$), so that $\sigma^{-1}\left(I_{\tau(i)}\right)$ is an interval. Thus, $\sigma^{-1}\left(I_{\tau(i)}\right)$ is a nonempty interval (nonempty because $I_{\tau(i)}$ is nonempty). Similarly, $\sigma^{-1}\left(I_{\tau(i+1)}\right)$ is a nonempty interval.

Also, Proposition 6.2.14(a) (applied to $j = i + 1$) yields

$$\sigma^{-1}\left(I_{\tau(i+1)}\right) = \left[\sum_{k=1}^{i} \alpha_{\tau(k)} : \sum_{k=1}^{i+1} \alpha_{\tau(k)}\right]^+ . \tag{13.156.2}$$

Now,

$$\sigma^{-1}\left(I_{\tau(i)}\right) = \left[\sum_{k=1}^{i-1} \alpha_{\tau(k)} : \sum_{k=1}^{i} \alpha_{\tau(k)}\right]^+ < \left[\sum_{k=1}^{i} \alpha_{\tau(k)} : \sum_{k=1}^{i+1} \alpha_{\tau(k)}\right]^+ = \sigma^{-1}\left(I_{\tau(i+1)}\right).$$

Also,

$$\underbrace{\sigma^{-1}\left(I_{\tau(i)}\right)}_{\substack{=\left[\sum_{k=1}^{i-1} \alpha_{\tau(k)} : \sum_{k=1}^{i} \alpha_{\tau(k)}\right]^+ \\ \text{(by (13.156.1))}}} \cup \underbrace{\sigma^{-1}\left(I_{\tau(i+1)}\right)}_{\substack{=\left[\sum_{k=1}^{i} \alpha_{\tau(k)} : \sum_{k=1}^{i+1} \alpha_{\tau(k)}\right]^+ \\ \text{(by (13.156.2))}}}$$
$$= \left[\sum_{k=1}^{i-1} \alpha_{\tau(k)} : \sum_{k=1}^{i} \alpha_{\tau(k)}\right]^+ \cup \left[\sum_{k=1}^{i} \alpha_{\tau(k)} : \sum_{k=1}^{i+1} \alpha_{\tau(k)}\right]^+ = \left[\sum_{k=1}^{i-1} \alpha_{\tau(k)} : \sum_{k=1}^{i+1} \alpha_{\tau(k)}\right]^+ ,$$

which is obviously an interval. Proposition 6.2.14(d) is proven. □

13.157. **Solution to Exercise 6.2.17.** *Solution to Exercise 6.2.17.*

Proof of Proposition 6.2.16. We shall use Definition 13.126.3 and Proposition 13.126.4.

(a) The interval system corresponding to α is an ℓ-tuple of intervals (since $\ell(\alpha) = \ell$); denote this ℓ-tuple by $(I_1, I_2, \ldots, I_\ell)$. Then, the intervals $I_1, I_2, \ldots, I_\ell$ form a set partition of $[0 : n]^+$ (according to Remark 6.2.6(c)) and are nonempty (also according to Remark 6.2.6(c)).

We define a map $\operatorname{iper}'_\alpha : \{\omega \in \mathfrak{S}_n \mid \omega \text{ is } \alpha\text{-clumping}\} \to \mathfrak{S}_\ell$ as follows: Let ω be an α-clumping element of $\mathfrak{S}_n$. Then, every $i \in \{1, 2, \ldots, \ell\}$ has the property that $\omega^{-1}(I_i)$ is an interval (since ω is α-clumping). These intervals $\omega^{-1}(I_1)$, $\omega^{-1}(I_2)$, $\ldots$, $\omega^{-1}(I_\ell)$ form a set partition of $[0 : n]^+$ (since the intervals I_1, I_2, $\ldots$, I_ℓ form a set partition of $[0 : n]^+$), and thus are disjoint (and nonempty[1093]). Hence, these intervals form a totally ordered set with respect to the relation $<$ (by Remark 6.2.6(b)). Thus, there exists a unique permutation $\tau \in \mathfrak{S}_\ell$ such that $\omega^{-1}\left(I_{\tau(1)}\right) < \omega^{-1}\left(I_{\tau(2)}\right) < \cdots < \omega^{-1}\left(I_{\tau(\ell)}\right)$. We define $\operatorname{iper}'_\alpha(\omega)$ to be this permutation τ.

[1093] Their nonemptiness follows from the fact that the intervals I_1, I_2, $\ldots$, I_ℓ are nonempty.

Thus, we have defined a map $\operatorname{iper}'_\alpha : \{\omega \in \mathfrak{S}_n \mid \omega \text{ is } \alpha\text{-clumping}\} \to \mathfrak{S}_\ell$. It is easy to see that $\operatorname{iper}_\alpha \circ \operatorname{iper}'_\alpha = \operatorname{id}$ [1094] and that $\operatorname{iper}'_\alpha \circ \operatorname{iper}_\alpha = \operatorname{id}$ [1095]. Hence, the maps $\operatorname{iper}_\alpha$ and $\operatorname{iper}'_\alpha$ are mutually inverse, and thus the map $\operatorname{iper}_\alpha$ is bijective. This completes the proof of Proposition 6.2.16(a).

[1094] *Proof.* Let $\omega \in \mathfrak{S}_n$ be α-clumping. We are going to prove that $\left(\operatorname{iper}_\alpha \circ \operatorname{iper}'_\alpha\right)(\omega) = \operatorname{id}(\omega)$.

Indeed, let us recall how $\operatorname{iper}'_\alpha(\omega)$ was defined: Every $i \in \{1, 2, \ldots, \ell\}$ has the property that $\omega^{-1}(I_i)$ is an interval. These intervals $\omega^{-1}(I_1)$, $\omega^{-1}(I_2)$, $\ldots$, $\omega^{-1}(I_\ell)$ form a totally ordered set with respect to the relation $<$. Then, $\operatorname{iper}'_\alpha(\omega)$ is defined as the unique permutation $\tau \in \mathfrak{S}_\ell$ such that $\omega^{-1}\left(I_{\tau(1)}\right) < \omega^{-1}\left(I_{\tau(2)}\right) < \cdots < \omega^{-1}\left(I_{\tau(\ell)}\right)$. Thus, we have $\operatorname{iper}'_\alpha(\omega) \in \mathfrak{S}_\ell$ and

$$\omega^{-1}\left(I_{\left(\operatorname{iper}'_\alpha(\omega)\right)(1)}\right) < \omega^{-1}\left(I_{\left(\operatorname{iper}'_\alpha(\omega)\right)(2)}\right) < \cdots < \omega^{-1}\left(I_{\left(\operatorname{iper}'_\alpha(\omega)\right)(\ell)}\right). \tag{13.157.1}$$

Denote the permutation $\operatorname{iper}'_\alpha(\omega) \in \mathfrak{S}_\ell$ by τ. Then, (13.157.1) rewrites as

$$\omega^{-1}\left(I_{\tau(1)}\right) < \omega^{-1}\left(I_{\tau(2)}\right) < \cdots < \omega^{-1}\left(I_{\tau(\ell)}\right) \tag{13.157.2}$$

(since $\tau = \operatorname{iper}'_\alpha(\omega)$). The definition of $\operatorname{iper}(\alpha, \tau)$ shows that $\operatorname{iper}(\alpha, \tau)$ is the permutation in $\mathfrak{S}_n$ which (in one-line notation) is the word $\overrightarrow{I_{\tau(1)}}\overrightarrow{I_{\tau(2)}}\cdots\overrightarrow{I_{\tau(\ell)}}$ (a concatenation of ℓ words). In other words, $\operatorname{iper}(\alpha, \tau) = \overrightarrow{I_{\tau(1)}}\overrightarrow{I_{\tau(2)}}\cdots\overrightarrow{I_{\tau(\ell)}}$. Denote this permutation $\operatorname{iper}(\alpha, \tau)$ by η. Then, $\eta = \operatorname{iper}(\alpha, \tau) = \overrightarrow{I_{\tau(1)}}\overrightarrow{I_{\tau(2)}}\cdots\overrightarrow{I_{\tau(\ell)}}$ and

$$\begin{aligned}\left(\operatorname{iper}_\alpha \circ \operatorname{iper}'_\alpha\right)(\omega) &= \operatorname{iper}_\alpha\left(\underbrace{\operatorname{iper}'_\alpha(\omega)}_{=\tau}\right) = \operatorname{iper}_\alpha \tau = \operatorname{iper}(\alpha, \tau) \qquad (\text{by the definition of } \operatorname{iper}_\alpha \tau) \\ &= \eta. \end{aligned} \tag{13.157.3}$$

Our next goal is to prove that $\eta = \omega$.

We know that ω is α-clumping. In other words, every $i \in \{1, 2, \ldots, \ell\}$ has the two properties that:

$$\text{the set } \omega^{-1}(I_i) \text{ is an interval,} \tag{13.157.4}$$

and

$$\text{the restriction of the map } \omega^{-1} \text{ to the interval } I_i \text{ is increasing} \tag{13.157.5}$$

(by the definition of "α-clumping").

We shall now prove that $\operatorname{Inv}\left(\eta^{-1}\right) \subset \operatorname{Inv}\left(\omega^{-1}\right)$.

Indeed, let (i, j) be some element of $\operatorname{Inv}\left(\eta^{-1}\right)$. We want to prove that $(i, j) \in \operatorname{Inv}\left(\omega^{-1}\right)$.

We have $(i, j) \in \operatorname{Inv}\left(\eta^{-1}\right)$. By the definition of $\operatorname{Inv}\left(\eta^{-1}\right)$, this yields that (i, j) is an element of $\{1, 2, \ldots, n\}^2$ satisfying $i < j$ and $\eta^{-1}(i) > \eta^{-1}(j)$. In particular, $\eta^{-1}(i) > \eta^{-1}(j)$. In other words, the letter i must appear after the letter j in the word η (where our use of the word "after" does not imply "immediately after"). Since $\eta = \overrightarrow{I_{\tau(1)}}\overrightarrow{I_{\tau(2)}}\cdots\overrightarrow{I_{\tau(\ell)}}$, this rewrites as follows: The letter i must appear after the letter j in the word $\overrightarrow{I_{\tau(1)}}\overrightarrow{I_{\tau(2)}}\cdots\overrightarrow{I_{\tau(\ell)}}$. Thus, we must be in one of the following two cases:

Case 1: There exist some elements $\mathbf{i}$ and $\mathbf{j}$ of $\{1, 2, \ldots, \ell\}$ such that $\mathbf{i} > \mathbf{j}$ and such that the letter i appears in the word $\overrightarrow{I_{\tau(\mathbf{i})}}$, whereas the letter j appears in the word $\overrightarrow{I_{\tau(\mathbf{j})}}$.

Case 2: There exists some element $\mathbf{i}$ of $\{1, 2, \ldots, \ell\}$ such that both letters i and j appear in the word $\overrightarrow{I_{\tau(\mathbf{i})}}$, and the letter i appears after the letter j in this word.

Let us first consider Case 1. In this case, there exist some elements $\mathbf{i}$ and $\mathbf{j}$ of $\{1, 2, \ldots, \ell\}$ such that $\mathbf{i} > \mathbf{j}$ and such that the letter i appears in the word $\overrightarrow{I_{\tau(\mathbf{i})}}$, whereas the letter j appears in the word $\overrightarrow{I_{\tau(\mathbf{j})}}$. Consider these $\mathbf{i}$ and $\mathbf{j}$. The letter i appears in the word $\overrightarrow{I_{\tau(\mathbf{i})}}$, and thus is an element of $I_{\tau(\mathbf{i})}$ (since the letters of the word $\overrightarrow{I_{\tau(\mathbf{i})}}$ are precisely the elements of $I_{\tau(\mathbf{i})}$). In other words, $i \in I_{\tau(\mathbf{i})}$. Hence, $\omega^{-1}(i) \in \omega^{-1}\left(I_{\tau(\mathbf{i})}\right)$. Similarly, $\omega^{-1}(j) \in \omega^{-1}\left(I_{\tau(\mathbf{j})}\right)$. Now, $\mathbf{i} > \mathbf{j}$, so that $\mathbf{j} < \mathbf{i}$ and thus $\omega^{-1}\left(I_{\tau(\mathbf{j})}\right) < \omega^{-1}\left(I_{\tau(\mathbf{i})}\right)$ (due to (13.157.2)). In other words, every $j' \in \omega^{-1}\left(I_{\tau(\mathbf{j})}\right)$ and $i' \in \omega^{-1}\left(I_{\tau(\mathbf{i})}\right)$ satisfy $j' < i'$ (by the definition of $\omega^{-1}\left(I_{\tau(\mathbf{j})}\right) < \omega^{-1}\left(I_{\tau(\mathbf{i})}\right)$). Applying this to $j' = \omega^{-1}(j)$ and $i' = \omega^{-1}(i)$, we obtain $\omega^{-1}(j) < \omega^{-1}(i)$, so that $\omega^{-1}(i) > \omega^{-1}(j)$.

Now, we know that (i, j) is an element of $\{1, 2, \ldots, n\}^2$ satisfying $i < j$ and $\omega^{-1}(i) > \omega^{-1}(j)$. In other words, $(i, j) \in \operatorname{Inv}\left(\omega^{-1}\right)$ (by the definition of $\operatorname{Inv}\left(\omega^{-1}\right)$). Hence, $(i, j) \in \operatorname{Inv}\left(\omega^{-1}\right)$ is proven in Case 1.

Let us now consider Case 2. In this case, there exists some element $\mathbf{i}$ of $\{1, 2, \ldots, \ell\}$ such that both letters i and j appear in the word $\overrightarrow{I_{\tau(\mathbf{i})}}$, and the letter i appears after the letter j in this word. Consider this i. The letters of the word $\overrightarrow{I_{\tau(\mathbf{i})}}$ are in increasing order (since $\overrightarrow{I_{\tau(\mathbf{i})}}$ is defined as the list of all elements of $I_{\tau(\mathbf{i})}$ in increasing order). Since the letter i appears after the letter j in this word, we must therefore have $i > j$. But this contradicts $i < j$. This contradiction shows that Case 2 cannot occur. Hence, the only possible case is Case 1. Since we have proven $(i, j) \in \operatorname{Inv}\left(\omega^{-1}\right)$ in this case, we therefore conclude that $(i, j) \in \operatorname{Inv}\left(\omega^{-1}\right)$ always holds.

Now, let us forget that we fixed (i, j). We thus have proven that $(i, j) \in \operatorname{Inv}\left(\omega^{-1}\right)$ for every $(i, j) \in \operatorname{Inv}\left(\eta^{-1}\right)$. In other words,

$$\operatorname{Inv}\left(\eta^{-1}\right) \subset \operatorname{Inv}\left(\omega^{-1}\right). \tag{13.157.6}$$

(b) Consider the map $\operatorname{iper}_\alpha$ defined in Proposition 6.2.16(a). Since σ is α-clumping, we have $\sigma \in \{\omega \in \mathfrak{S}_n \mid \omega \text{ is } \alpha\text{-clumping}\}$. In other words, σ belongs to the target of the map $\operatorname{iper}_\alpha$. Thus, σ has a unique preimage under the map $\operatorname{iper}_\alpha$ (since the map $\operatorname{iper}_\alpha$ is bijective (by Proposition 6.2.16(a))). In other words, there exists a unique $\tau \in \mathfrak{S}_\ell$ satisfying $\sigma = \operatorname{iper}_\alpha \tau$. Since $\operatorname{iper}_\alpha \tau = \operatorname{iper}(\alpha, \tau)$ for every $\tau \in \mathfrak{S}_{p+q}$

Next, let us prove that $\operatorname{Inv}\left(\omega^{-1}\right) \subset \operatorname{Inv}\left(\eta^{-1}\right)$.

Indeed, let (i, j) be some element of $\operatorname{Inv}\left(\omega^{-1}\right)$. We want to prove that $(i, j) \in \operatorname{Inv}\left(\eta^{-1}\right)$.

We have $(i, j) \in \operatorname{Inv}\left(\omega^{-1}\right)$. By the definition of $\operatorname{Inv}\left(\omega^{-1}\right)$, this yields that (i, j) is an element of $\{1, 2, \ldots, n\}^2$ satisfying $i < j$ and $\omega^{-1}(i) > \omega^{-1}(j)$.

The intervals $I_1, I_2, \ldots, I_\ell$ form a set partition of $[0 : n]^+$ (according to Remark 6.2.6(c)). Hence, there exists some $u \in \{1, 2, \ldots, \ell\}$ such that $i \in I_u$ (because $i \in \{1, 2, \ldots, n\} = [0 : n]^+$). Similarly, there exists some $v \in \{1, 2, \ldots, \ell\}$ such that $j \in I_v$. Consider these u and v.

First, let us assume (for the sake of contradiction) that $u = v$. Then, $i \in I_u = I_v$ (since $u = v$) and $j \in I_v$. But (13.157.5) (applied to v instead of i) yields that the restriction of the map ω^{-1} to the interval I_v is increasing. Hence, $\omega^{-1}(i) \leq \omega^{-1}(j)$ (since the elements i and j both lie in the interval I_v and satisfy $i < j$), which contradicts $\omega^{-1}(i) > \omega^{-1}(j)$. This contradiction shows that our assumption (that $u = v$) was wrong. Hence, we have $u \neq v$. Thus, $\tau^{-1}(u) \neq \tau^{-1}(v)$ (since τ is a permutation).

Define two elements $\mathbf{i}$ and $\mathbf{j}$ of $\{1, 2, \ldots, \ell\}$ by $\mathbf{i} = \tau^{-1}(u)$ and $\mathbf{j} = \tau^{-1}(v)$. Then, $\tau(\mathbf{i}) = u$ (since $\mathbf{i} = \tau^{-1}(u)$), so that $I_{\tau(\mathbf{i})} = I_u$ and thus $i \in I_u = I_{\tau(\mathbf{i})}$ (since $I_{\tau(\mathbf{i})} = I_u$). Similarly, $j \in I_{\tau(\mathbf{j})}$. We have $\mathbf{i} = \tau^{-1}(u) \neq \tau^{-1}(v) = \mathbf{j}$.

Now, let us assume (for the sake of contradiction) that $\mathbf{i} \leq \mathbf{j}$. Combined with $\mathbf{i} \neq \mathbf{j}$, this yields $\mathbf{i} < \mathbf{j}$. Hence, $\omega^{-1}\left(I_{\tau(\mathbf{i})}\right) < \omega^{-1}\left(I_{\tau(\mathbf{j})}\right)$ (due to (13.157.2)). Thus, every $i' \in \omega^{-1}\left(I_{\tau(\mathbf{i})}\right)$ and $j' \in \omega^{-1}\left(I_{\tau(\mathbf{j})}\right)$ satisfy $i' < j'$ (by the definition of $\omega^{-1}\left(I_{\tau(\mathbf{i})}\right) < \omega^{-1}\left(I_{\tau(\mathbf{j})}\right)$). Applying this to $i' = \omega^{-1}(i)$ and $j' = \omega^{-1}(j)$, we obtain $\omega^{-1}(i) < \omega^{-1}(j)$ (since $\omega^{-1}\left(\underbrace{i}_{\in I_{\tau(\mathbf{i})}}\right) \in \omega^{-1}\left(I_{\tau(\mathbf{i})}\right)$ and $\omega^{-1}\left(\underbrace{j}_{\in I_{\tau(\mathbf{j})}}\right) \in \omega^{-1}\left(I_{\tau(\mathbf{j})}\right)$), which contradicts $\omega^{-1}(i) > \omega^{-1}(j)$. This contradiction proves that our assumption (that $\mathbf{i} \leq \mathbf{j}$) was wrong. Hence, we have $\mathbf{i} > \mathbf{j}$.

Now, recall that the word $\overrightarrow{I_{\tau(\mathbf{i})}}$ is defined as the list of all elements of $I_{\tau(\mathbf{i})}$ in increasing order. Hence, i is a letter of the word $\overrightarrow{I_{\tau(\mathbf{i})}}$ (since i is an element of $I_{\tau(\mathbf{i})}$). Similarly, j is a letter of the word $\overrightarrow{I_{\tau(\mathbf{j})}}$. Both words $\overrightarrow{I_{\tau(\mathbf{i})}}$ and $\overrightarrow{I_{\tau(\mathbf{j})}}$ are factors of the concatenation $\overrightarrow{I_{\tau(1)}}\,\overrightarrow{I_{\tau(2)}} \cdots \overrightarrow{I_{\tau(\ell)}}$, with the factor $\overrightarrow{I_{\tau(\mathbf{i})}}$ appearing after the factor $\overrightarrow{I_{\tau(\mathbf{j})}}$ (since $\mathbf{i} > \mathbf{j}$). Thus, if i_0 is any letter of the word $\overrightarrow{I_{\tau(\mathbf{i})}}$, and if j_0 is any letter of the word $\overrightarrow{I_{\tau(\mathbf{j})}}$, then the letter i_0 appears after the letter j_0 in the concatenation $\overrightarrow{I_{\tau(1)}}\,\overrightarrow{I_{\tau(2)}} \cdots \overrightarrow{I_{\tau(\ell)}}$. Applying this to $i_0 = i$ and $j_0 = j$, we conclude that the letter i appears after the letter j in the concatenation $\overrightarrow{I_{\tau(1)}}\,\overrightarrow{I_{\tau(2)}} \cdots \overrightarrow{I_{\tau(\ell)}}$ (since i is a letter of the word $\overrightarrow{I_{\tau(\mathbf{i})}}$, and since j is a letter of the word $\overrightarrow{I_{\tau(\mathbf{j})}}$). In other words, the letter i appears after the letter j in the word η (since $\eta = \overrightarrow{I_{\tau(1)}}\,\overrightarrow{I_{\tau(2)}} \cdots \overrightarrow{I_{\tau(\ell)}}$). In other words, $\eta^{-1}(i) > \eta^{-1}(j)$.

So (i, j) is an element of $\{1, 2, \ldots, n\}^2$ satisfying $i < j$ and $\eta^{-1}(i) > \eta^{-1}(j)$. In other words, $(i, j) \in \operatorname{Inv}\left(\eta^{-1}\right)$ (by the definition of $\operatorname{Inv}\left(\eta^{-1}\right)$).

Now, let us forget that we fixed (i, j). We thus have proven that $(i, j) \in \operatorname{Inv}\left(\eta^{-1}\right)$ for every $(i, j) \in \operatorname{Inv}\left(\omega^{-1}\right)$. In other words,

$$\operatorname{Inv}\left(\omega^{-1}\right) \subset \operatorname{Inv}\left(\eta^{-1}\right).$$

Combined with (13.157.6), this yields $\operatorname{Inv}\left(\omega^{-1}\right) = \operatorname{Inv}\left(\eta^{-1}\right)$. Thus, Proposition 13.126.4 (applied to $\varphi = \omega^{-1}$ and $\psi = \eta^{-1}$) yields $\omega^{-1} = \eta^{-1}$, whence $\omega = \eta = \left(\operatorname{iper}_\alpha \circ \operatorname{iper}'_\alpha\right)(\omega)$ (by (13.157.3)), so that $\left(\operatorname{iper}_\alpha \circ \operatorname{iper}'_\alpha\right)(\omega) = \omega = \operatorname{id}(\omega)$.

Now, let us forget that we fixed ω. We thus have proven that $\left(\operatorname{iper}_\alpha \circ \operatorname{iper}'_\alpha\right)(\omega) = \operatorname{id}(\omega)$ for every α-clumping permutation $\omega \in \mathfrak{S}_n$. In other words, $\operatorname{iper}_\alpha \circ \operatorname{iper}'_\alpha = \operatorname{id}$, qed.

[1095] *Proof.* Let $\pi \in \mathfrak{S}_\ell$. We shall show that that $\left(\operatorname{iper}'_\alpha \circ \operatorname{iper}_\alpha\right)(\pi) = \operatorname{id}(\pi)$.

Indeed, let $\omega = \operatorname{iper}_\alpha \pi$. Then, $\omega = \operatorname{iper}_\alpha \pi = \operatorname{iper}(\alpha, \pi)$ (by the definition of $\operatorname{iper}_\alpha \pi$). The permutation $\omega = \operatorname{iper}(\alpha, \pi)$ is α-clumping (according to Proposition 6.2.14(c), applied to $\tau = \pi$).

Let us now recall how $\operatorname{iper}'_\alpha(\omega)$ was defined: Every $i \in \{1, 2, \ldots, \ell\}$ has the property that $\omega^{-1}(I_i)$ is an interval. These intervals $\omega^{-1}(I_1), \omega^{-1}(I_2), \ldots, \omega^{-1}(I_\ell)$ form a totally ordered set with respect to the relation $<$. Then, $\operatorname{iper}'_\alpha(\omega)$ is defined as the unique permutation $\tau \in \mathfrak{S}_\ell$ such that $\omega^{-1}\left(I_{\tau(1)}\right) < \omega^{-1}\left(I_{\tau(2)}\right) < \cdots < \omega^{-1}\left(I_{\tau(\ell)}\right)$. Hence, if $\tau \in \mathfrak{S}_\ell$ is a permutation satisfying $\omega^{-1}\left(I_{\tau(1)}\right) < \omega^{-1}\left(I_{\tau(2)}\right) < \cdots < \omega^{-1}\left(I_{\tau(\ell)}\right)$, then

$$\tau = \operatorname{iper}'_\alpha(\omega). \tag{13.157.7}$$

We shall now use this to prove that $\pi = \operatorname{iper}'_\alpha(\omega)$.

We have $\omega = \operatorname{iper}(\alpha, \pi) = \overrightarrow{I_{\pi(1)}}\,\overrightarrow{I_{\pi(2)}} \cdots \overrightarrow{I_{\pi(\ell)}}$ (in one-line notation), according to the definition of $\operatorname{iper}(\alpha, \pi)$.

The intervals $\omega^{-1}(I_1), \omega^{-1}(I_2), \ldots, \omega^{-1}(I_\ell)$ form a set partition of $[0 : n]^+$ (since the intervals $I_1, I_2, \ldots, I_\ell$ form a set partition of $[0 : n]^+$), and thus are disjoint. These intervals $\omega^{-1}(I_1), \omega^{-1}(I_2), \ldots, \omega^{-1}(I_\ell)$ are also nonempty (since the intervals $I_1, I_2, \ldots, I_\ell$ are nonempty).

Now, let $u \in \{1, 2, \ldots, \ell - 1\}$. The intervals $\omega^{-1}\left(I_{\pi(u)}\right)$ and $\omega^{-1}\left(I_{\pi(u+1)}\right)$ are nonempty (since the intervals $\omega^{-1}(I_1), \omega^{-1}(I_2), \ldots, \omega^{-1}(I_\ell)$ are nonempty). We will show that $\omega^{-1}\left(I_{\pi(u)}\right) < \omega^{-1}\left(I_{\pi(u+1)}\right)$.

Indeed, let $i \in \omega^{-1}\left(I_{\pi(u)}\right)$ and $j \in \omega^{-1}\left(I_{\pi(u+1)}\right)$ be arbitrary. We shall prove that $i < j$.

(by the definition of $\operatorname{iper}_\alpha$), this rewrites as follows: There exists a unique $\tau \in \mathfrak{S}_\ell$ satisfying $\sigma = \operatorname{iper}(\alpha, \tau)$. This proves Proposition 6.2.16(b). □

13.158. **Solution to Exercise 6.2.19.** *Solution to Exercise 6.2.19.*

Proof of Proposition 6.2.18. We know that $\alpha\beta$ is a composition of $n+m$ having length $\ell(\alpha\beta) = \ell(\alpha) + \ell(\beta) = p+q$. Hence, the interval system corresponding to $\alpha\beta$ is a $(p+q)$-tuple of intervals which covers $[0:n+m]^+$. Denote this $(p+q)$-tuple by $(I_1, I_2, \ldots, I_{p+q})$. It is clear that $I_1 \cup I_2 \cup \cdots \cup I_p = [0:n]^+$ and $I_{p+1} \cup I_{p+2} \cup \cdots \cup I_{p+q} = [n:n+m]^+$ (since the first p parts of the composition $\alpha\beta$ form the composition α of n). Moreover, $I_1 < I_2 < \cdots < I_{p+q}$ (since $(I_1, I_2, \ldots, I_{p+q})$ is the interval system corresponding to $\alpha\beta$).

The definition of $\operatorname{iper}(\alpha\beta, \tau)$ yields that $\operatorname{iper}(\alpha\beta,\tau) = \overrightarrow{I_{\tau(1)}}\,\overrightarrow{I_{\tau(2)}} \cdots \overrightarrow{I_{\tau(p+q)}}$ (in one-line notation). Denote the permutation $\operatorname{iper}(\alpha\beta,\tau)$ by ω; then, this becomes $\omega = \overrightarrow{I_{\tau(1)}}\,\overrightarrow{I_{\tau(2)}} \cdots \overrightarrow{I_{\tau(p+q)}}$. For every $j \in \{1, 2, \ldots, p+q\}$, the restriction of the map ω^{-1} to the interval $I_{\tau(j)}$ is increasing (by Proposition 6.2.14(b), applied to $n+m$, $\alpha\beta$, $p+q$ and ω instead of n, α, ℓ and σ). Substituting k for $\tau(j)$ here, we obtain: For every $k \in \{1, 2, \ldots, p+q\}$, the restriction of the map ω^{-1} to the interval I_k is increasing. Of course, this yields that for every $k \in \{1, 2, \ldots, p+q\}$, the restriction of the map ω^{-1} to the interval I_k is strictly increasing (because ω^{-1} is injective).

Now, we need to prove that $\tau \in \operatorname{Sh}_{p,q}$ if and only if $\operatorname{iper}(\alpha\beta,\tau) \in \operatorname{Sh}_{n,m}$. In other words, we need to prove that $\tau \in \operatorname{Sh}_{p,q}$ if and only if $\omega \in \operatorname{Sh}_{n,m}$ (since $\omega = \operatorname{iper}(\alpha\beta,\tau)$). We shall prove the $\Longrightarrow$ and $\Longleftarrow$ directions of this statement separately:

$\Longrightarrow$: Assume that $\tau \in \operatorname{Sh}_{p,q}$. We need to show that $\omega \in \operatorname{Sh}_{n,m}$.

We have $\tau \in \operatorname{Sh}_{p,q}$. Thus, $\tau^{-1}(1) < \tau^{-1}(2) < \cdots < \tau^{-1}(p)$ and $\tau^{-1}(p+1) < \tau^{-1}(p+2) < \cdots < \tau^{-1}(p+q)$.

Now, let i and j be two elements of $\{1, 2, \ldots, n\}$ such that $i < j$. We are going to prove that $\omega^{-1}(i) < \omega^{-1}(j)$.

Indeed, we have $i \in \{1, 2, \ldots, n\} = [0:n]^+ = I_1 \cup I_2 \cup \cdots \cup I_p$, so that $i \in I_{i'}$ for some $i' \in \{1, 2, \ldots, p\}$. Similarly, $j \in I_{j'}$ for some $j' \in \{1, 2, \ldots, p\}$. Consider these i' and j'. We cannot have $j' < i'$ (because this would entail $I_{j'} < I_{i'}$ (due to $I_1 < I_2 < \cdots < I_{p+q}$), which would lead to $j < i$ (since $j \in I_{j'}$ and $i \in I_{i'}$), contradicting $i < j$). Hence, we must have either $j' = i'$ or $j' > i'$. If $j' = i'$, then i and j lie in one and the same I_k (namely, the one with $k = j' = i'$), and so $\omega^{-1}(i) < \omega^{-1}(j)$ follows from the fact that the map ω^{-1} restricted to I_k is strictly increasing (and from the inequality $i < j$). Hence, it only remains to consider the case when $j' > i'$. Assume WLOG that we are in this case. Then, $i' < j'$, and so $\tau^{-1}(i') < \tau^{-1}(j')$ (since $\tau^{-1}(1) < \tau^{-1}(2) < \cdots < \tau^{-1}(p)$ and since i' and j' belong to $\{1, 2, \ldots, p\}$), and thus the word $\overrightarrow{I_{i'}}$ appears before the word $\overrightarrow{I_{j'}}$ in the concatenation $\overrightarrow{I_{\tau(1)}}\,\overrightarrow{I_{\tau(2)}} \cdots \overrightarrow{I_{\tau(p+q)}}$. Hence, the letter i appears before the letter

---

We have $i \in \omega^{-1}\left(I_{\pi(u)}\right)$, so that $\omega(i) \in I_{\pi(u)}$. Hence, $\omega(i)$ is a letter of the word $\overrightarrow{I_{\pi(u)}}$ (since the word $\overrightarrow{I_{\pi(u)}}$ is defined as the list of all elements of $I_{\pi(u)}$ in increasing order). Similarly, $\omega(j)$ is a letter of the word $\overrightarrow{I_{\pi(u+1)}}$ (since $j \in \omega^{-1}\left(I_{\pi(u+1)}\right)$).

Both words $\overrightarrow{I_{\pi(u)}}$ and $\overrightarrow{I_{\pi(u+1)}}$ are factors of the concatenation $\overrightarrow{I_{\pi(1)}}\,\overrightarrow{I_{\pi(2)}} \cdots \overrightarrow{I_{\pi(\ell)}}$, with the factor $\overrightarrow{I_{\pi(u+1)}}$ appearing after the factor $\overrightarrow{I_{\pi(u)}}$. Thus, if i_0 is any letter of the word $\overrightarrow{I_{\pi(u)}}$, and if j_0 is any letter of the word $\overrightarrow{I_{\pi(u+1)}}$, then the letter j_0 appears after the letter i_0 in the concatenation $\overrightarrow{I_{\pi(1)}}\,\overrightarrow{I_{\pi(2)}} \cdots \overrightarrow{I_{\pi(\ell)}}$. Applying this to $i_0 = \omega(i)$ and $j_0 = \omega(j)$, we conclude that the letter $\omega(j)$ appears after the letter $\omega(i)$ in the concatenation $\overrightarrow{I_{\pi(1)}}\,\overrightarrow{I_{\pi(2)}} \cdots \overrightarrow{I_{\pi(\ell)}}$ (since $\omega(i)$ is a letter of the word $\overrightarrow{I_{\pi(u)}}$, and since $\omega(j)$ is a letter of the word $\overrightarrow{I_{\pi(u+1)}}$). In other words, the letter $\omega(j)$ appears after the letter $\omega(i)$ in the word ω (since $\omega = \overrightarrow{I_{\pi(1)}}\,\overrightarrow{I_{\pi(2)}} \cdots \overrightarrow{I_{\pi(\ell)}}$). In other words, $\omega^{-1}(\omega(j)) > \omega^{-1}(\omega(i))$. In other words, $j > i$, so that $i < j$.

Now, let us forget that we fixed i and j. We thus have proven that every $i \in \omega^{-1}\left(I_{\pi(u)}\right)$ and $j \in \omega^{-1}\left(I_{\pi(u+1)}\right)$ satisfy $i < j$. In other words, $\omega^{-1}\left(I_{\pi(u)}\right) < \omega^{-1}\left(I_{\pi(u+1)}\right)$ (by the definition of $\omega^{-1}\left(I_{\pi(u)}\right) < \omega^{-1}\left(I_{\pi(u+1)}\right)$).

Now, let us forget that we fixed u. We thus have proven that $\omega^{-1}\left(I_{\pi(u)}\right) < \omega^{-1}\left(I_{\pi(u+1)}\right)$ for every $u \in \{1, 2, \ldots, \ell-1\}$. In other words, $\omega^{-1}\left(I_{\pi(1)}\right) < \omega^{-1}\left(I_{\pi(2)}\right) < \cdots < \omega^{-1}\left(I_{\pi(\ell)}\right)$. Therefore, (13.157.7) (applied to $\tau = \pi$) yields $\pi = \operatorname{iper}'_\alpha\left(\underbrace{\omega}_{=\operatorname{iper}_\alpha \pi}\right) = \operatorname{iper}'_\alpha(\operatorname{iper}_\alpha \pi) = (\operatorname{iper}'_\alpha \circ \operatorname{iper}_\alpha)(\pi)$. Hence, $(\operatorname{iper}'_\alpha \circ \operatorname{iper}_\alpha)(\pi) = \pi = \operatorname{id}(\pi)$.

Now, let us forget that we fixed π. We thus have proven that $(\operatorname{iper}'_\alpha \circ \operatorname{iper}_\alpha)(\pi) = \operatorname{id}(\pi)$ for every $\pi \in \mathfrak{S}_\ell$. In other words, $\operatorname{iper}'_\alpha \circ \operatorname{iper}_\alpha = \operatorname{id}$, qed.

j in the concatenation $\overrightarrow{I_{\tau(1)}}\overrightarrow{I_{\tau(2)}}\cdots\overrightarrow{I_{\tau(p+q)}}$ (because the letter i appears in $\overrightarrow{I_{i'}}$, while the letter j appears in $\overrightarrow{I_{j'}}$). Since $\overrightarrow{I_{\tau(1)}}\overrightarrow{I_{\tau(2)}}\cdots\overrightarrow{I_{\tau(p+q)}} = \omega$, this shows that the letter i appears before the letter j in the word ω. In other words, $\omega^{-1}(i) < \omega^{-1}(j)$.

So we have shown that if two elements i and j of $\{1, 2, \ldots, n\}$ satisfy $i < j$, then $\omega^{-1}(i) < \omega^{-1}(j)$. In other words, $\omega^{-1}(1) < \omega^{-1}(2) < \cdots < \omega^{-1}(n)$. Similarly, $\omega^{-1}(n+1) < \omega^{-1}(n+2) < \cdots < \omega^{-1}(n+m)$. Combining these two chains of inequalities, we conclude that $\omega \in \operatorname{Sh}_{n,m}$. This proves the $\Longrightarrow$ direction.

$\Longleftarrow$: Assume that $\omega \in \operatorname{Sh}_{n,m}$. We need to prove that $\tau \in \operatorname{Sh}_{p,q}$.

We have $\omega \in \operatorname{Sh}_{n,m}$. Thus, $\omega^{-1}(1) < \omega^{-1}(2) < \cdots < \omega^{-1}(n)$ and $\omega^{-1}(n+1) < \omega^{-1}(n+2) < \cdots < \omega^{-1}(n+m)$.

Let i' and j' be two elements of $\{1, 2, \ldots, p\}$ such that $i' < j'$. We are going to prove that $\tau^{-1}(i') < \tau^{-1}(j')$.

Indeed, assume the contrary. Then, $\tau^{-1}(i') \geq \tau^{-1}(j')$, thus $\tau^{-1}(i') > \tau^{-1}(j')$ (since τ is a permutation). Hence, the word $\overrightarrow{I_{i'}}$ appears after[1096] the word $\overrightarrow{I_{j'}}$ in the concatenation $\overrightarrow{I_{\tau(1)}}\overrightarrow{I_{\tau(2)}}\cdots\overrightarrow{I_{\tau(p+q)}}$.

Now, fix any $i \in I_{i'}$ (such an i exists since $I_{i'}$ is nonempty) and fix any $j \in I_{j'}$ (this exists for similar reasons). We have $I_{i'} < I_{j'}$ (since $I_1 < I_2 < \cdots < I_{p+q}$ and $i' < j'$), so that $i < j$ (since $i \in I_{i'}$ and $j \in I_{j'}$).

But the letter i appears after the letter j in the concatenation $\overrightarrow{I_{\tau(1)}}\overrightarrow{I_{\tau(2)}}\cdots\overrightarrow{I_{\tau(p+q)}}$ (because the letter i appears in the word $\overrightarrow{I_{i'}}$, whereas the letter j appears in the word $\overrightarrow{I_{j'}}$, and we know that the word $\overrightarrow{I_{i'}}$ appears after the word $\overrightarrow{I_{j'}}$ in the concatenation $\overrightarrow{I_{\tau(1)}}\overrightarrow{I_{\tau(2)}}\cdots\overrightarrow{I_{\tau(p+q)}}$). In other words, the letter i appears after the letter j in the word ω (since $\overrightarrow{I_{\tau(1)}}\overrightarrow{I_{\tau(2)}}\cdots\overrightarrow{I_{\tau(p+q)}} = \omega$). In other words, $\omega^{-1}(i) > \omega^{-1}(j)$.

But $i' \in \{1, 2, \ldots, p\}$, so that $I_{i'} \subset I_1 \cup I_2 \cup \cdots \cup I_p = [0 : n]^+$ and thus $i \in I_{i'} \subset [0 : n]^+$. Similarly, $j \in [0 : n]^+$. Since the map ω^{-1} restricted to $[0 : n]^+$ is strictly increasing (since $\omega^{-1}(1) < \omega^{-1}(2) < \cdots < \omega^{-1}(n)$), we thus have $\omega^{-1}(i) < \omega^{-1}(j)$ (since $i < j$), contradicting $\omega^{-1}(i) > \omega^{-1}(j)$. This contradiction shows that our assumption was wrong, and so we have shown that $\tau^{-1}(i') < \tau^{-1}(j')$.

Thus, we have proven that if two elements i' and j' of $\{1, 2, \ldots, p\}$ satisfy $i' < j'$, then $\tau^{-1}(i') < \tau^{-1}(j')$. In other words, $\tau^{-1}(1) < \tau^{-1}(2) < \cdots < \tau^{-1}(p)$. Similarly, we can show that $\tau^{-1}(p+1) < \tau^{-1}(p+2) < \cdots < \tau^{-1}(p+q)$. The combination of these two chains of inequalities shows that $\tau \in \operatorname{Sh}_{p,q}$. Thus, the $\Longleftarrow$ direction is proven. The proof of Proposition 6.2.18 is thus complete. □

13.159. **Solution to Exercise 6.2.21.** *Solution to Exercise 6.2.21.*

Proof of Lemma 6.2.20. We have $\tau \in \operatorname{Sh}_{p,q}$ if and only if $\operatorname{iper}(\alpha\beta, \tau) \in \operatorname{Sh}_{n,m}$ (by Proposition 6.2.18). Since we know that $\tau \in \operatorname{Sh}_{p,q}$, we thus conclude that $\operatorname{iper}(\alpha\beta, \tau) \in \operatorname{Sh}_{n,m}$. In other words, $\sigma \in \operatorname{Sh}_{n,m}$ (since $\sigma = \operatorname{iper}(\alpha\beta, \tau)$).

Write the composition $\alpha\beta$ in the form $(\gamma_1, \gamma_2, \ldots, \gamma_{p+q})$. For every $j \in \{0, 1, \ldots, p+q\}$, let s_j denote the integer $\sum_{k=1}^{j} \gamma_{\tau(k)}$. Then, $0 = s_0 < s_1 < s_2 < \cdots < s_{p+q} = n + m$.

Let w denote the word $u \underset{\sigma}{\sqcup\!\sqcup} v$.

The first p parts of the composition $\alpha\beta$ form the composition α of n. Hence, the interval system $(I_1, I_2, \ldots, I_{p+q})$ corresponding to $\alpha\beta$ satisfies $I_1 \cup I_2 \cup \cdots \cup I_p = [0 : n]^+$ and $I_{p+1} \cup I_{p+2} \cup \cdots \cup I_{p+q} = [n : n+m]^+$.

Let $i \in \{1, 2, \ldots, p+q\}$. We know that $I_{\tau(i)}$ is an interval of $\mathbb{Z}$ satisfying either $I_{\tau(i)} \subset [0 : n]^+$ or $I_{\tau(i)} \subset [n : n+m]^+$ (in fact, if $\tau(i) \leq p$, then $I_{\tau(i)} \subset I_1 \cup I_2 \cup \cdots \cup I_p = [0 : n]^+$, whereas otherwise, $I_{\tau(i)} \subset I_{p+1} \cup I_{p+2} \cup \cdots \cup I_{p+q} = [n : n+m]^+$). Also, Proposition 6.2.14(a) (applied to $n+m$, $\alpha\beta$, $(\gamma_1, \gamma_2, \ldots, \gamma_{p+q})$,

[1096] "after" does not imply "immediately after".

$p+q$ and i instead of n, α, $(\alpha_1, \alpha_2, \ldots, \alpha_\ell)$, ℓ and j) yields

$$\sigma^{-1}\left(I_{\tau(i)}\right) = \left[\underbrace{\sum_{k=1}^{i-1} \gamma_{\tau(k)}}_{\substack{=s_{i-1} \\ \text{(by the definition of } s_{i-1})}} : \underbrace{\sum_{k=1}^{i} \gamma_{\tau(k)}}_{\substack{=s_i \\ \text{(by the definition of } s_i)}}\right]^+ = [s_{i-1} : s_i]^+ . \tag{13.159.1}$$

Consequently, $\sigma^{-1}\left(I_{\tau(i)}\right)$ is an interval. Therefore, we can apply Lemma 6.2.10(a) to $I_{\tau(i)}$ instead of I. As a result, we obtain

$$\left(u \underset{\sigma}{\sqcup\!\sqcup} v\right)\left[\sigma^{-1}\left(I_{\tau(i)}\right)\right] = (uv)\left[I_{\tau(i)}\right].$$

Hence,

$$(uv)\left[I_{\tau(i)}\right] = \underbrace{\left(u \underset{\sigma}{\sqcup\!\sqcup} v\right)}_{=w}\left[\underbrace{\sigma^{-1}\left(I_{\tau(i)}\right)}_{\substack{=[s_{i-1}:s_i]^+ \\ \text{(by (13.159.1))}}}\right] = w\left[[s_{i-1} : s_i]^+\right]. \tag{13.159.2}$$

Now, forget that we fixed i. We thus have proven (13.159.2) for every $i \in \{1, 2, \ldots, p+q\}$. Now,

$$\begin{aligned}
&\underbrace{(uv)\left[I_{\tau(1)}\right]}_{\substack{=w\left[[s_0:s_1]^+\right] \\ \text{(by (13.159.2))}}} \cdot \underbrace{(uv)\left[I_{\tau(2)}\right]}_{\substack{=w\left[[s_1:s_2]^+\right] \\ \text{(by (13.159.2))}}} \cdot \cdots \cdot \underbrace{(uv)\left[I_{\tau(p+q)}\right]}_{\substack{=w\left[[s_{p+q-1}:s_{p+q}]^+\right] \\ \text{(by (13.159.2))}}} \\
&= w\left[[s_0 : s_1]^+\right] \cdot w\left[[s_1 : s_2]^+\right] \cdot \cdots \cdot w\left[[s_{p+q-1} : s_{p+q}]^+\right] \\
&= w\left[[s_0 : s_{p+q}]^+\right] = w\left[[0 : n+m]^+\right] \qquad (\text{since } s_0 = 0 \text{ and } s_{p+q} = n+m) \\
&= w \qquad \left(\text{since the word } w = u \underset{\sigma}{\sqcup\!\sqcup} v \text{ has length } n+m\right) \\
&= u \underset{\sigma}{\sqcup\!\sqcup} v.
\end{aligned}$$

This proves Lemma 6.2.20. □

13.160. **Solution to Exercise 6.2.24.** *Solution to Exercise 6.2.24.*

Proof of Proposition 6.2.23. We have $h(1) \geq h(2) \geq \cdots \geq h(p)$. Hence, for every $w \in \mathfrak{W}$, the set $\{i \in \{1, 2, \ldots, p\} \mid h(i) = w\}$ is a (possibly empty) interval of $\{1, 2, \ldots, p\}$, and will be denoted by P_w. Similarly, for every $w \in \mathfrak{W}$, the set $\{i \in \{p+1, p+2, \ldots, p+q\} \mid h(i) = w\}$ is a (possibly empty) interval of $\{p+1, p+2, \ldots, p+q\}$, and will be denoted by Q_w. Every $w \in \mathfrak{W}$ satisfies $h^{-1}(w) = P_w \sqcup Q_w$. Notice that $|P_w| = \mathfrak{a}(w)$ and $|Q_w| = \mathfrak{b}(w)$ for all $w \in \mathfrak{W}$.

Let $(g_1, g_2, \ldots, g_{p+q})$ be the result of sorting the list $(h(1), h(2), \ldots, h(p+q))$ in decreasing order. Then, $g_1 \geq g_2 \geq \cdots \geq g_{p+q}$. Hence, for every $w \in \mathfrak{W}$, the set $\{j \in \{1, 2, \ldots, p+q\} \mid g_j = w\}$ is a (possibly empty) interval of $\{1, 2, \ldots, p+q\}$. Denote this interval by I_w. The size of this interval is

$$\begin{aligned}
|I_w| &= |\{j \in \{1, 2, \ldots, p+q\} \mid g_j = w\}| \qquad (\text{since } I_w = \{j \in \{1, 2, \ldots, p+q\} \mid g_j = w\}) \\
&= \left|\underbrace{\{j \in \{1, 2, \ldots, p+q\} \mid h(j) = w\}}_{=h^{-1}(w)=P_w \sqcup Q_w}\right| \qquad \left(\begin{array}{c}\text{since } (g_1, g_2, \ldots, g_{p+q}) \text{ is the result of} \\ \text{sorting the list } (h(1), h(2), \ldots, h(p+q))\end{array}\right) \\
&= |P_w \sqcup Q_w| = |P_w| + |Q_w|.
\end{aligned}$$

Notice that $\{1, 2, \ldots, p+q\} = \bigsqcup_{w \in \mathfrak{W}} I_w$ (by the definition of the I_w).

Fix $w \in \mathfrak{W}$. Let us define an (I_w, P_w, Q_w)*-shuffle* to mean a bijection $\kappa : I_w \to P_w \sqcup Q_w$ having the property that the maps $\kappa^{-1}|_{P_w} : P_w \to I_w$ and $\kappa^{-1}|_{Q_w} : Q_w \to I_w$ are strictly increasing. It is easy to see that such a (I_w, P_w, Q_w)-shuffle κ is uniquely determined by the subset $\kappa^{-1}(P_w)$ of I_w, and that for a given subset U of I_w, such a (I_w, P_w, Q_w)-shuffle κ satisfying $\kappa^{-1}(P_w) = U$ exists if and only if $|U| = |P_w|$. Hence, there are as many (I_w, P_w, Q_w)-shuffles as there are subsets U of I_w satisfying $|U| = |P_w|$. In other words,

$$\begin{aligned}
&(\text{the number of } (I_w, P_w, Q_w)\text{-shuffles}) \\
&= (\text{the number of subsets } U \text{ of } I_w \text{ satisfying } |U| = |P_w|) \\
&= \binom{|I_w|}{|P_w|} = \binom{\mathfrak{a}(w) + \mathfrak{b}(w)}{\mathfrak{a}(w)} \qquad (13.160.1)
\end{aligned}$$

(since $|I_w| = \underbrace{|P_w|}_{=\mathfrak{a}(w)} + \underbrace{|Q_w|}_{=\mathfrak{b}(w)} = \mathfrak{a}(w) + \mathfrak{b}(w)$ and $|P_w| = \mathfrak{a}(w)$).

Now, forget that we fixed w.

Consider any $\tau \in \mathrm{Sh}_{p,q}$ satisfying $h(\tau(1)) \geq h(\tau(2)) \geq \cdots \geq h(\tau(p+q))$. Then, $(h(\tau(1)), h(\tau(2)), \ldots, h(\tau(p+q))) = (g_1, g_2, \ldots, g_{p+q})$ [1097]. In other words, $h(\tau(j)) = g_j$ for every $j \in \{1, 2, \ldots, p+q\}$. Thus,

$$\tau(I_w) = P_w \sqcup Q_w \qquad \text{for every } w \in \mathfrak{W} \qquad (13.160.2)$$

[1098]. As a consequence, for every $w \in \mathfrak{W}$, the bijection $\tau : \{1, 2, \ldots, p+q\} \to \{1, 2, \ldots, p+q\}$ restricts to a bijection $\tau_w : I_w \to P_w \sqcup Q_w$. This bijection τ_w is an (I_w, P_w, Q_w)-shuffle[1099]. Thus, we have obtained a family $(\tau_w)_{w \in \mathfrak{W}}$ of (I_w, P_w, Q_w)-shuffles parametrized over all $w \in \mathfrak{W}$.

Now, let us forget that we fixed τ. We thus have constructed, for every $\tau \in \mathrm{Sh}_{p,q}$ satisfying $h(\tau(1)) \geq h(\tau(2)) \geq \cdots \geq h(\tau(p+q))$, a family $(\tau_w)_{w \in \mathfrak{W}}$ of (I_w, P_w, Q_w)-shuffles parametrized over all $w \in \mathfrak{W}$. We thus obtain a map

$$\begin{aligned}
\{\tau \in \mathrm{Sh}_{p,q} \mid h(\tau(1)) \geq h(\tau(2)) \geq \cdots \geq h(\tau(p+q))\} &\to \prod_{w \in \mathfrak{W}} (\text{the set of all } (I_w, P_w, Q_w)\text{-shuffles}), \\
\tau &\mapsto (\tau_w)_{w \in \mathfrak{W}}.
\end{aligned}$$

This map is injective[1100] and surjective[1101]. Hence, it is bijective, and this yields that the sets

$$\{\tau \in \mathrm{Sh}_{p,q} \mid h(\tau(1)) \geq h(\tau(2)) \geq \cdots \geq h(\tau(p+q))\}$$

[1097] *Proof.* The list $(h(\tau(1)), h(\tau(2)), \ldots, h(\tau(p+q)))$ is a permutation of the list $(h(1), h(2), \ldots, h(p+q))$ (since $\tau \in \mathfrak{S}_{p+q}$), but is weakly decreasing (since $h(\tau(1)) \geq h(\tau(2)) \geq \cdots \geq h(\tau(p+q))$). Hence, the list $(h(\tau(1)), h(\tau(2)), \ldots, h(\tau(p+q)))$ is the result of sorting the list $(h(1), h(2), \ldots, h(p+q))$ in decreasing order. But this yields that $(h(\tau(1)), h(\tau(2)), \ldots, h(\tau(p+q))) = (g_1, g_2, \ldots, g_{p+q})$ (since $(g_1, g_2, \ldots, g_{p+q})$, too, is the result of sorting the list $(h(1), h(2), \ldots, h(p+q))$ in decreasing order), qed.

[1098] *Proof of (13.160.2):* Let $w \in \mathfrak{W}$. Then,

$$\begin{aligned}
I_w &= \left\{ j \in \{1, 2, \ldots, p+q\} \mid \underbrace{g_j}_{\substack{=h(\tau(j)) \\ =(h\circ\tau)(j)}} = w \right\} = \{ j \in \{1, 2, \ldots, p+q\} \mid (h \circ \tau)(j) = w \} \\
&= (h \circ \tau)^{-1}(w) = \tau^{-1}\left(h^{-1}(w)\right).
\end{aligned}$$

Since τ is a permutation, this yields $\tau(I_w) = h^{-1}(w) = P_w \sqcup Q_w$, and thus (13.160.2) is proven.

[1099] *Proof.* We have $\tau \in \mathrm{Sh}_{p,q}$, so that $\tau^{-1}(1) < \tau^{-1}(2) < \cdots < \tau^{-1}(p)$ and $\tau^{-1}(p+1) < \tau^{-1}(p+2) < \cdots < \tau^{-1}(p+q)$. In other words, the restriction of τ^{-1} to $\{1, 2, \ldots, p\}$ is strictly increasing, and the restriction of τ^{-1} to $\{p+1, p+2, \ldots, p+q\}$ is strictly increasing. Since the restriction of τ^{-1} to $\{1, 2, \ldots, p\}$ is strictly increasing, the restriction of τ^{-1} to P_w must also be strictly increasing (because $P_w \subset \{1, 2, \ldots, p\}$). But this restriction is $\tau_w^{-1} \mid_{P_w} : P_w \to I_w$. Hence, $\tau_w^{-1} \mid_{P_w} : P_w \to I_w$ is strictly increasing. Similarly, the same can be said about $\tau_w^{-1} \mid_{Q_w} : Q_w \to I_w$. Since the maps $\tau_w^{-1} \mid_{P_w} : P_w \to I_w$ and $\tau_w^{-1} \mid_{Q_w} : Q_w \to I_w$ are strictly increasing, we conclude that τ_w is an (I_w, P_w, Q_w)-shuffle (by the definition of a (I_w, P_w, Q_w)-shuffle), qed.

[1100] In fact, any $\tau \in \mathrm{Sh}_{p,q}$ is uniquely determined by $(\tau_w)_{w \in \mathfrak{W}}$ (because τ_w is the restriction of τ to I_w (with a restricted codomain, but this doesn't matter right now), and so knowing $(\tau_w)_{w \in \mathfrak{W}}$ means knowing the values τ on each of the intervals I_w; but this means knowing all values of τ, because $\{1, 2, \ldots, p+q\} = \bigsqcup_{w \in \mathfrak{W}} I_w$).

[1101] *Proof.* We need to show that for every

$$(\sigma_w)_{w \in \mathfrak{W}} \in \prod_{w \in \mathfrak{W}} (\text{the set of all } (I_w, P_w, Q_w)\text{-shuffles}),$$

there exists a $\tau \in \mathrm{Sh}_{p,q}$ satisfying $h(\tau(1)) \geq h(\tau(2)) \geq \cdots \geq h(\tau(p+q))$ and $(\tau_w)_{w \in \mathfrak{W}} = (\sigma_w)_{w \in \mathfrak{W}}$.

and

$$\prod_{w\in\mathfrak{W}} (\text{the set of all } (I_w, P_w, Q_w)\text{-shuffles})$$

are in bijection. Thus,

$$\begin{aligned}
&|\{\tau \in \operatorname{Sh}_{p,q} \ \mid \ h(\tau(1)) \geq h(\tau(2)) \geq \cdots \geq h(\tau(p+q))\}| \\
&= \left| \prod_{w\in\mathfrak{W}} (\text{the set of all } (I_w, P_w, Q_w)\text{-shuffles}) \right| \\
&= \prod_{w\in\mathfrak{W}} \underbrace{|(\text{the set of all } (I_w, P_w, Q_w)\text{-shuffles})|}_{\substack{=(\text{the number of } (I_w,P_w,Q_w)\text{-shuffles})=\dbinom{\mathfrak{a}(w)+\mathfrak{b}(w)}{\mathfrak{a}(w)} \\ (\text{by } (13.160.1))}} \\
&= \prod_{w\in\mathfrak{W}} \binom{\mathfrak{a}(w)+\mathfrak{b}(w)}{\mathfrak{a}(w)}.
\end{aligned}$$

This is precisely the statement of Proposition 6.2.23. □

So fix some $(\sigma_w)_{w\in\mathfrak{W}} \in \prod_{w\in\mathfrak{W}} (\text{the set of all } (I_w, P_w, Q_w)\text{-shuffles})$. For every $w \in \mathfrak{W}$, the map σ_w is an (I_w, P_w, Q_w)-shuffle, hence a bijection from I_w to $P_w \sqcup Q_w$. Since $\bigsqcup_{w\in\mathfrak{W}} I_w = \{1, 2, \ldots, p+q\}$ and $\bigsqcup_{w\in\mathfrak{W}} \underbrace{(P_w \sqcup Q_w)}_{=h^{-1}(w)} = \bigsqcup_{w\in\mathfrak{W}} h^{-1}(w) = \{1, 2, \ldots, p+q\}$, we can piece these bijections σ_w together to a bijection

$$\bigsqcup_{w\in\mathfrak{W}} \sigma_w : \{1, 2, \ldots, p+q\} \to \{1, 2, \ldots, p+q\},$$

whose restriction to each interval I_w coincides with the respective σ_w (except that the codomains of the maps are different). Let τ be this bijection $\bigsqcup_{w\in\mathfrak{W}} \sigma_w$. Clearly, $\tau \in \mathfrak{S}_{p+q}$. We will now show that $\tau \in \operatorname{Sh}_{p,q}$, $h(\tau(1)) \geq h(\tau(2)) \geq \cdots \geq h(\tau(p+q))$ and $(\tau_w)_{w\in\mathfrak{W}} = (\sigma_w)_{w\in\mathfrak{W}}$. Once this is done, the required surjectivity will clearly follow.

Since $\tau = \bigsqcup_{w\in\mathfrak{W}} \sigma_w$, we have $\tau\mid_{I_w} = \sigma_w$ for every $w \in \mathfrak{W}$ (up to the fact that the maps $\tau\mid_{I_w}$ and σ_w have different codomains). More precisely, $\tau_w = \sigma_w$ for every $w \in \mathfrak{W}$. Hence, for every $w \in \mathfrak{W}$, the map σ_w is a restriction of τ (with appropriately restricted codomain).

The map $\tau = \bigsqcup_{w\in\mathfrak{W}} \sigma_w$ is pieced together from bijections $\sigma_w : I_w \to P_w \sqcup Q_w$. Thus, $\tau(I_w) = P_w \sqcup Q_w$ for every $w \in \mathfrak{W}$. In other words, $\tau(I_w) = h^{-1}(w)$ for every $w \in \mathfrak{W}$ (since every $w \in \mathfrak{W}$ satisfies $h^{-1}(w) = P_w \sqcup Q_w$). Hence,

$$\text{every } i \in \{1, 2, \ldots, p+q\} \text{ satisfies } h(\tau(i)) = g_i. \tag{13.160.3}$$

[*Proof of (13.160.3):* Let $i \in \{1, 2, \ldots, p+q\}$. Set $w = h(\tau(i))$. Then, $\tau(i) \in h^{-1}(w) = \tau(I_w)$ (since $\tau(I_w) = h^{-1}(w)$) and thus $i \in I_w$ (since τ is a bijection), so that $i \in I_w = \{j \in \{1, 2, \ldots, p+q\} \ \mid \ g_j = w\}$ and thus $g_i = w = h(\tau(i))$. This proves (13.160.3).]

We have $g_1 \geq g_2 \geq \cdots \geq g_{p+q}$. Due to (13.160.3), this rewrites as $h(\tau(1)) \geq h(\tau(2)) \geq \cdots \geq h(\tau(p+q))$.

We now are going to prove that $\tau \in \operatorname{Sh}_{p,q}$. In order to prove this, it is enough to show that $\tau^{-1}(1) < \tau^{-1}(2) < \cdots < \tau^{-1}(p)$ and $\tau^{-1}(p+1) < \tau^{-1}(p+2) < \cdots < \tau^{-1}(p+q)$. We shall only verify $\tau^{-1}(1) < \tau^{-1}(2) < \cdots < \tau^{-1}(p)$ (the proof of $\tau^{-1}(p+1) < \tau^{-1}(p+2) < \cdots < \tau^{-1}(p+q)$ being analogous).

So let i and j be elements of $\{1, 2, \ldots, p\}$ such that $i < j$. We will prove that $\tau^{-1}(i) < \tau^{-1}(j)$. Indeed, assume the contrary. Then, $\tau^{-1}(i) \geq \tau^{-1}(j)$. In other words, $\tau^{-1}(j) \leq \tau^{-1}(i)$. Thus, $h\left(\tau\left(\tau^{-1}(j)\right)\right) \geq h\left(\tau\left(\tau^{-1}(i)\right)\right)$ (since $h(\tau(1)) \geq h(\tau(2)) \geq \cdots \geq h(\tau(p+q))$). In other words, $h(j) \geq h(i)$. Combined with $h(i) \geq h(j)$ (since $h(1) \geq h(2) \geq \cdots \geq h(p)$ and $i < j$), this yields $h(i) = h(j)$. So we can define a $w \in \mathfrak{W}$ by $w = h(i) = h(j)$. Consider this w. We have $h(i) = w$, so that $i \in h^{-1}(w) = P_w \sqcup Q_w$. But we cannot have $i \in Q_w$ (because i lies in the set $\{1, 2, \ldots, p\}$, which is disjoint to Q_w (since $Q_w \subset \{p+1, p+2, \ldots, p+q\}$)). Since we have $i \in P_w \sqcup Q_w$ but not $i \in Q_w$, we must have $i \in P_w$. Similarly, $j \in P_w$. But recall that σ_w is a (I_w, P_w, Q_w)-shuffle. In other words, $\sigma_w : I_w \to P_w \sqcup Q_w$ is a bijection having the property that the maps $\sigma_w^{-1}\mid_{P_w} : P_w \to I_w$ and $\sigma_w^{-1}\mid_{Q_w} : Q_w \to I_w$ are strictly increasing. Since $\sigma_w^{-1}\mid_{P_w} : P_w \to I_w$ is strictly increasing, we have $\left(\sigma_w^{-1}\mid_{P_w}\right)(i) < \left(\sigma_w^{-1}\mid_{P_w}\right)(j)$ (since $i < j$ and $i \in P_w$ and $j \in P_w$). Since $\left(\sigma_w^{-1}\mid_{P_w}\right)(i) = \sigma_w^{-1}(i) = \tau^{-1}(i)$ (because σ_w is a restriction of τ) and $\left(\sigma_w^{-1}\mid_{P_w}\right)(j) = \tau^{-1}(j)$ (similarly), this rewrites as $\tau^{-1}(i) < \tau^{-1}(j)$, which contradicts $\tau^{-1}(i) \geq \tau^{-1}(j)$. This contradiction proves our assumption wrong, and so we have $\tau^{-1}(i) < \tau^{-1}(j)$.

Let us forget that we fixed i and j. We thus have seen that $\tau^{-1}(i) < \tau^{-1}(j)$ for any elements i and j of $\{1, 2, \ldots, p\}$ such that $i < j$. In other words, $\tau^{-1}(1) < \tau^{-1}(2) < \cdots < \tau^{-1}(p)$. Similarly, $\tau^{-1}(p+1) < \tau^{-1}(p+2) < \cdots < \tau^{-1}(p+q)$. Thus, $\tau \in \operatorname{Sh}_{p,q}$.

We now know that $\tau \in \operatorname{Sh}_{p,q}$ and $h(\tau(1)) \geq h(\tau(2)) \geq \cdots \geq h(\tau(p+q))$. Finally, $(\tau_w)_{w\in\mathfrak{W}} = (\sigma_w)_{w\in\mathfrak{W}}$ follows from the very definition of τ_w (since $\tau_w = \sigma_w$ for every $w \in \mathfrak{W}$). This completes the proof.

13.161. **Solution to Exercise 6.2.25.** *Solution to Exercise 6.2.25.* $\Longrightarrow$: Assume that w is Lyndon. We need to prove that for any two nonempty words $u \in \mathfrak{A}^*$ and $v \in \mathfrak{A}^*$ satisfying $w = uv$, there exists at least one $s \in u \shuffle v$ satisfying $s > w$.

Let $u \in \mathfrak{A}^*$ and $v \in \mathfrak{A}^*$ be two nonempty words satisfying $w = uv$. Then, vu is an element of $u \shuffle v$ [1102] and satisfies $vu > uv$ (by Proposition 6.1.14(c)). Thus, $vu > uv = w$. Hence, there exists at least one $s \in u \shuffle v$ satisfying $s > w$ (namely, $s = vu$). Thus, the $\Longrightarrow$ direction of Exercise 6.2.25 is solved.

$\Longleftarrow$: Assume that for any two nonempty words $u \in \mathfrak{A}^*$ and $v \in \mathfrak{A}^*$ satisfying $w = uv$,

$$\text{there exists at least one } s \in u \shuffle v \text{ satisfying } s > w. \tag{13.161.1}$$

We need to prove that w is Lyndon.

In fact, assume the contrary. Thus, w is not Lyndon. Let $(a_1, a_2, \ldots, a_p)$ be the CFL factorization of w; then, $a_1 \geq a_2 \geq \cdots \geq a_p$ and $a_1 a_2 \cdots a_p = w$. Also, $p \neq 0$ (since $a_1 a_2 \cdots a_p = w$ is nonempty). Since a_1 is Lyndon but w is not, we have $a_1 \neq w$. Thus, $p \neq 1$ (because otherwise, we would have $a_1 = a_1 a_2 \cdots a_p = w$, contradicting $a_1 \neq w$). Combined with $p \neq 0$, this yields $p \geq 2$.

Let $u = a_1$ and $v = a_2 a_3 \cdots a_p$. Then, u is Lyndon (since $u = a_1$), thus nonempty. Also, v is a nonempty product of Lyndon words (nonempty because $p \geq 2$), and hence nonempty itself (since Lyndon words are nonempty). Clearly, $\underbrace{u}_{=a_1} \underbrace{v}_{=a_2 a_3 \cdots a_p} = a_1 (a_2 a_3 \cdots a_p) = a_1 a_2 \cdots a_p = w$. Thus, (13.161.1) yields that there exists at least one $s \in u \shuffle v$ satisfying $s > w$. Thus, w is not the lexicographically highest element of the multiset $u \shuffle v$.

Now, notice that a_2, a_3, $\ldots$, a_p are Lyndon words satisfying $a_2 \geq a_3 \geq \cdots \geq a_p$ (since $a_1 \geq a_2 \geq \cdots \geq a_p$) and $a_2 a_3 \cdots a_p = v$. Hence, $(a_2, a_3, \ldots, a_p)$ is the CFL factorization of v. We have $u = a_1 \geq a_{j+1}$ for every $j \in \{1, 2, \ldots, p-1\}$ (since $a_1 \geq a_2 \geq \cdots \geq a_p$). Thus, Theorem 6.2.2(e) (applied to $p-1$ and $(a_2, a_3, \ldots, a_p)$ instead of q and $(b_1, b_2, \ldots, b_q)$) yields that the lexicographically highest element of the multiset $u \shuffle v$ is uv, and the multiplicity with which this word uv appears in the multiset $u \shuffle v$ is $\operatorname{mult}_u v + 1$.

Now, we know that the lexicographically highest element of the multiset $u \shuffle v$ is $uv = w$. This contradicts the fact that w is not the lexicographically highest element of the multiset $u \shuffle v$. This contradiction shows that our assumption was wrong. Thus, w is Lyndon. This completes the solution of the $\Longleftarrow$ direction of Exercise 6.2.25.

Thus, both the $\Longrightarrow$ and $\Longleftarrow$ directions of Exercise 6.2.25 are proven. Exercise 6.2.25 is thus solved.

[*Remark:* Exercise 6.2.25 still holds in the partial-order setting[1103]. To prove this, we can use Proposition 13.146.3 along with the fact that Exercise 6.2.25 holds in the total-order setting. Here are the details:

Solution to Exercise 6.2.25 in the partial-order setting. $\Longrightarrow$: In the partial-order setting, the $\Longrightarrow$ direction of Exercise 6.2.25 can be proved in the same way as it was proven in the total-order setting.

$\Longleftarrow$: Assume that for any two nonempty words $u \in \mathfrak{A}^*$ and $v \in \mathfrak{A}^*$ satisfying $w = uv$,

$$\text{there exists at least one } s \in u \shuffle v \text{ satisfying } s > w. \tag{13.161.2}$$

We need to prove that w is Lyndon.

Let $\mathfrak{B}$ be any linear extension of the alphabet $\mathfrak{A}$. Then, $\mathfrak{B}^*$ is an extension of $\mathfrak{A}^*$ (according to Proposition 13.146.3(a)). Thus, $\mathfrak{B}^* = \mathfrak{A}^*$ as sets. It is easy to see that for any two nonempty words $u \in \mathfrak{B}^*$ and $v \in \mathfrak{B}^*$ satisfying $w = uv$,

$$\text{there exists at least one } s \in u \shuffle v \text{ satisfying } s > w \text{ in } \mathfrak{B}^*. \tag{13.161.3}$$

[1104]

[1102] *Proof.* Let $n = \ell(u)$ and $m = \ell(v)$. Then, the permutation in $\mathfrak{S}_{n+m}$ which is written as $(n+1, n+2, \ldots, n+m, 1, 2, \ldots, n)$ in one-line notation belongs to $\operatorname{Sh}_{n,m}$. If we denote this permutation by σ, then $vu = u \underset{\sigma}{\shuffle} v \in u \shuffle v$, qed.

[1103] See Exercise 6.1.33 for an explanation of what the partial-order setting is.

[1104] *Proof of (13.161.3):* Let $u \in \mathfrak{B}^*$ and $v \in \mathfrak{B}^*$. Then, $u \in \mathfrak{B}^* = \mathfrak{A}^*$ and $v \in \mathfrak{B}^* = \mathfrak{A}^*$. Hence, (13.161.2) shows that there exists at least one $s \in u \shuffle v$ satisfying $s > w$ in $\mathfrak{A}^*$. Let t be such an s. Then, t is an element of $u \shuffle v$ satisfying $t > w$ in $\mathfrak{A}^*$. Hence, $w < t$ in $\mathfrak{A}^*$ (since $t > w$ in $\mathfrak{A}^*$), so that $w \leq t$ in $\mathfrak{A}^*$.

Now, we can apply Exercise 6.2.25 to $\mathfrak{B}$ instead of $\mathfrak{A}$ (since $\mathfrak{B}$ is totally ordered). As a consequence, we see that w is Lyndon as a word in $\mathfrak{B}^*$ if and only if for any two nonempty words $u \in \mathfrak{B}^*$ and $v \in \mathfrak{B}^*$ satisfying $w = uv$, there exists at least one $s \in u \sqcup\!\sqcup v$ satisfying $s > w$ in $\mathfrak{B}^*$. Thus, w is Lyndon as a word in $\mathfrak{B}^*$ (because we know that for any two nonempty words $u \in \mathfrak{B}^*$ and $v \in \mathfrak{B}^*$ satisfying $w = uv$, there exists at least one $s \in u \sqcup\!\sqcup v$ satisfying $s > w$ in $\mathfrak{B}^*$).

Now, the definition of a Lyndon word shows the following: The word w (as a word in $\mathfrak{B}^*$) is Lyndon if and only if it is nonempty and satisfies the following property:

(13.161.4) Every nonempty proper suffix v of w satisfies $v > w$ in $\mathfrak{B}^*$.

Since the word w is Lyndon, this shows that the word w is nonempty and satisfies the property (13.161.4).

Let now v be a nonempty proper suffix of w (as a word in $\mathfrak{A}^*$). Then, v is a nonempty proper suffix of w (as a word in $\mathfrak{B}^*$). Thus, (13.161.4) shows that v satisfies $v > w$ in $\mathfrak{B}^*$.

Now, let us forget that we fixed $\mathfrak{B}$ and v. We thus have shown that if v is any nonempty proper suffix of w and if $\mathfrak{B}$ is any linear extension of the alphabet $\mathfrak{A}$, then

(13.161.5) $$v > w \text{ in } \mathfrak{B}^*.$$

But the definition of a Lyndon word shows the following: The word w (as a word in $\mathfrak{A}^*$) is Lyndon if and only if it is nonempty and satisfies the following property:

(13.161.6) Every nonempty proper suffix v of w satisfies $v > w$ (in $\mathfrak{A}^*$).

We already know that w is nonempty. We are now going to prove (13.161.6):

Let v be a nonempty proper suffix of w. We have $v > w$ in $\mathfrak{B}^*$ for every linear extension $\mathfrak{B}$ of $\mathfrak{A}$ (according to (13.161.5)). In other words, $w < v$ in $\mathfrak{B}^*$ for every linear extension $\mathfrak{B}$ of $\mathfrak{A}$.

But Proposition 13.146.3(b) (applied to w instead of u) yields that $w < v$ holds in $\mathfrak{A}^*$ if and only if we have

$$(w < v \text{ in } \mathfrak{B}^* \text{ for every linear extension } \mathfrak{B} \text{ of } \mathfrak{A}).$$

We thus conclude that $w < v$ holds in $\mathfrak{A}^*$ (since we know that $w < v$ in $\mathfrak{B}^*$ for every linear extension $\mathfrak{B}$ of $\mathfrak{A}$). In other words, $v > w$ in $\mathfrak{A}^*$. This proves (13.161.6).

So we know that the word w is nonempty and satisfies the property (13.161.6). Thus, the word w (as a word in $\mathfrak{A}^*$) is Lyndon (since the word w (as a word in $\mathfrak{A}^*$) is Lyndon if and only if it is nonempty and satisfies the property (13.161.6)). Thus, the $\Longleftarrow$ direction of Exercise 6.2.25 is proven in the partial-order setting.

Thus, both the $\Longrightarrow$ and $\Longleftarrow$ directions of Exercise 6.2.25 are proven in the partial-order setting. Hence, Exercise 6.2.25 is solved in the partial-order setting. □

]

13.162. **Solution to Exercise 6.3.3.** *Solution to Exercise 6.3.3.*

Proof of Remark 6.3.2. Let $(w_1, w_2, \ldots, w_{n+m})$ denote the concatenation $u \cdot v = (u_1, u_2, \ldots, u_n, v_1, v_2, \ldots, v_m)$. Then, $(u_1, u_2, \ldots, u_n, v_1, v_2, \ldots, v_m) = (w_1, w_2, \ldots, w_{n+m})$, so that $(u_1, u_2, \ldots, u_n) = (w_1, w_2, \ldots, w_n)$ and $(v_1, v_2, \ldots, v_m) = (w_{n+1}, w_{n+2}, \ldots, w_{n+m})$.

By the definition of b_u, we have $b_u = b_{u_1} b_{u_2} \cdots b_{u_n} = b_{w_1} b_{w_2} \cdots b_{w_n}$ (since $(u_1, u_2, \ldots, u_n) = (w_1, w_2, \ldots, w_n)$). By the definition of b_v, we have $b_v = b_{v_1} b_{v_2} \cdots b_{v_m} = b_{w_{n+1}} b_{w_{n+2}} \cdots b_{w_{n+m}}$ (since $(v_1, v_2, \ldots, v_m) = (w_{n+1}, w_{n+2}, \ldots, w_{n+m})$). Now,

$$\underbrace{b_u}_{= b_{w_1} b_{w_2} \cdots b_{w_n}} \sqcup\!\sqcup \underbrace{b_v}_{= b_{w_{n+1}} b_{w_{n+2}} \cdots b_{w_{n+m}}} = \left(b_{w_1} b_{w_2} \cdots b_{w_n}\right) \sqcup\!\sqcup \left(b_{w_{n+1}} b_{w_{n+2}} \cdots b_{w_{n+m}}\right)$$

(13.162.1) $$= \sum_{\sigma \in \operatorname{Sh}_{n,m}} b_{w_{\sigma(1)}} b_{w_{\sigma(2)}} \cdots b_{w_{\sigma(n+m)}}$$

We know that $\mathfrak{B}^*$ is an extension of $\mathfrak{A}^*$. Thus, any two elements a and b of $\mathfrak{A}^*$ satisfying $a \leq b$ in $\mathfrak{A}^*$ satisfy $a \leq b$ in $\mathfrak{B}^*$ (according to the definition of an "extension"). Applying this to $a = w$ and $b = t$, we obtain $w \leq t$ in $\mathfrak{B}^*$. Combined with $w \neq t$ (since $w < t$ in $\mathfrak{A}^*$), this yields $w < t$ in $\mathfrak{B}^*$. In other words, $t > w$ in $\mathfrak{B}^*$.

Hence, there exists at least one $s \in u \sqcup\!\sqcup v$ satisfying $s > w$ in $\mathfrak{B}^*$ (namely, $s = t$). This proves (13.161.3).

(by the definition of $\shuffle$).

However, for every $\sigma \in \operatorname{Sh}_{n,m}$, we have $u \underset{\sigma}{\shuffle} v = \left(w_{\sigma(1)}, w_{\sigma(2)}, \ldots, w_{\sigma(n+m)}\right)$ (by the definition of $u \underset{\sigma}{\shuffle} v$), and therefore $b_{u \underset{\sigma}{\shuffle} v} = b_{w_{\sigma(1)}} b_{w_{\sigma(2)}} \cdots b_{w_{\sigma(n+m)}}$ (by the definition of $b_{u \underset{\sigma}{\shuffle} v}$). Hence, $\sum_{\sigma \in \operatorname{Sh}_{n,m}} \underbrace{b_{u \underset{\sigma}{\shuffle} v}}_{= b_{w_{\sigma(1)}} b_{w_{\sigma(2)}} \cdots b_{w_{\sigma(n+m)}}} = \sum_{\sigma \in \operatorname{Sh}_{n,m}} b_{w_{\sigma(1)}} b_{w_{\sigma(2)}} \cdots b_{w_{\sigma(n+m)}}$. Compared with (13.162.1), this yields $b_u \shuffle b_v = \sum_{\sigma \in \operatorname{Sh}_{n,m}} b_{u \underset{\sigma}{\shuffle} v}$. This proves Remark 6.3.2. □

13.163. **Solution to Exercise 6.3.8.** *Solution to Exercise 6.3.8.*

Proof of Lemma 6.3.7. (a) Let $\mathfrak{M}$ denote the set of all finite multisets of Lyndon words over $\mathfrak{A}$. In other words, $\mathfrak{M}$ is the set of all finite multisets of elements of $\mathfrak{L}$ (since the elements of $\mathfrak{L}$ are the Lyndon words over $\mathfrak{A}$). Define two maps $\mathbf{m} : \mathfrak{M} \to \mathfrak{A}^*$ and $\mathbf{n} : \mathfrak{A}^* \to \mathfrak{M}$ as in Proposition 13.143.1. Then, Proposition 13.143.1 shows that these two maps $\mathbf{m}$ and $\mathbf{n}$ are mutually inverse bijections. Hence, the map $\mathbf{m}$ is a bijection.

On the other hand, for every $M \in \mathfrak{M}$, let us define an element $\mathbf{b}_M$ of A by setting $\mathbf{b}_M = b_{a_1} b_{a_2} \cdots b_{a_k}$, where $a_1, a_2, \ldots, a_k$ denote the elements of M listed in decreasing order. Then, $(b_w)_{w \in \mathfrak{L}}$ is an algebraically independent generating set of the $\mathbf{k}$-algebra A if and only if $(\mathbf{b}_M)_{M \in \mathfrak{M}}$ is a basis of the $\mathbf{k}$-module A [1105].

[1105] *Proof.* Let $\mathfrak{N}$ be the set of all families $(k_w)_{w \in \mathfrak{L}} \in \mathbb{N}^{\mathfrak{L}}$ of nonnegative integers (indexed by the Lyndon words) such that all but finitely many $w \in \mathfrak{L}$ satisfy $k_w = 0$. Proposition 13.143.2 (applied to $S = \mathfrak{L}$) shows that the map $\operatorname{mult} : \mathfrak{M} \to \mathfrak{N}$ that sends each multiset $M \in \mathfrak{M}$ to the family

$$((\text{multiplicity of } w \text{ in the multiset } M))_{w \in S} \in \mathfrak{N}$$

is well-defined and is a bijection. Consider this map mult.

For every family $f = (k_w)_{w \in \mathfrak{L}} \in \mathfrak{N}$, we can define an element $\mathbf{b}_f$ of A by $\mathbf{b}_f = \prod_{w \in \mathfrak{L}} (b_w)^{k_w}$. (This is well-defined, since A is commutative and since all but finitely many $w \in \mathfrak{L}$ satisfy $k_w = 0$). Then, $\left(\mathbf{b}_f\right)_{f \in \mathfrak{N}}$ is the family of all possible monomials in the "variables" b_w (that is, of all possible finite products of elements of the family $(b_w)_{w \in \mathfrak{L}}$, with multiplicities allowed). Hence,

$$\left(\begin{array}{c} (b_w)_{w \in \mathfrak{L}} \text{ is an algebraically independent generating set of the } \mathbf{k}\text{-algebra } A \\ \text{if and only if } \left(\mathbf{b}_f\right)_{f \in \mathfrak{N}} \text{ is a basis of the } \mathbf{k}\text{-module } A \end{array} \right). \tag{13.163.1}$$

Now, we claim that the family $\left(\mathbf{b}_f\right)_{f \in \mathfrak{N}}$ is a reindexing of the family $(\mathbf{b}_M)_{M \in \mathfrak{M}}$. Indeed, since mult is a bijection, it is clear that the family $\left(\mathbf{b}_f\right)_{f \in \mathfrak{N}}$ is a reindexing of the family $(\mathbf{b}_{\operatorname{mult} M})_{M \in \mathfrak{M}}$. We now will prove that every $M \in \mathfrak{M}$ satisfies $\mathbf{b}_{\operatorname{mult} M} = \mathbf{b}_M$.

Indeed, let $M \in \mathfrak{M}$. Let $a_1, a_2, \ldots, a_k$ denote the elements of M listed in decreasing order. Then, every $w \in \mathfrak{L}$ satisfies

$$(\text{multiplicity of } w \text{ in the multiset } M) = (\text{the number of } i \in \{1, 2, \ldots, k\} \text{ satisfying } a_i = w). \tag{13.163.2}$$

But by the definition of $\operatorname{mult} M$, we have

$$\begin{aligned} \operatorname{mult} M &= \left(\underbrace{(\text{multiplicity of } w \text{ in the multiset } M)}_{\substack{= (\text{the number of } i \in \{1,2,\ldots,k\} \text{ satisfying } a_i = w) \\ (\text{by } (13.163.2))}} \right)_{w \in \mathfrak{L}} \\ &= ((\text{the number of } i \in \{1, 2, \ldots, k\} \text{ satisfying } a_i = w))_{w \in \mathfrak{L}}, \end{aligned}$$

so that the definition of $\mathbf{b}_{\operatorname{mult} M}$ becomes

$$\begin{aligned} \mathbf{b}_{\operatorname{mult} M} &= \prod_{w \in \mathfrak{L}} \underbrace{(b_w)^{(\text{the number of } i \in \{1,2,\ldots,k\} \text{ satisfying } a_i = w)}}_{= \prod_{\substack{i \in \{1,2,\ldots,k\}; \\ a_i = w}} b_w} = \prod_{w \in \mathfrak{L}} \prod_{\substack{i \in \{1,2,\ldots,k\}; \\ a_i = w}} \underbrace{b_w}_{\substack{= b_{a_i} \\ (\text{since } w = a_i)}} = \prod_{w \in \mathfrak{L}} \prod_{\substack{i \in \{1,2,\ldots,k\}; \\ a_i = w}} b_{a_i} \\ &= \prod_{i \in \{1,2,\ldots,k\}} b_{a_i} = b_{a_1} b_{a_2} \cdots b_{a_k} = \mathbf{b}_M \end{aligned}$$

(since $\mathbf{b}_M$ was defined as $b_{a_1} b_{a_2} \cdots b_{a_k}$).

Forget now that we fixed M. We thus have shown that every $M \in \mathfrak{M}$ satisfies $\mathbf{b}_{\operatorname{mult} M} = \mathbf{b}_M$. Hence, $(\mathbf{b}_{\operatorname{mult} M})_{M \in \mathfrak{M}} = (\mathbf{b}_M)_{M \in \mathfrak{M}}$. But we know that the family $\left(\mathbf{b}_f\right)_{f \in \mathfrak{N}}$ is a reindexing of the family $(\mathbf{b}_{\operatorname{mult} M})_{M \in \mathfrak{M}}$. Since $(\mathbf{b}_{\operatorname{mult} M})_{M \in \mathfrak{M}} = (\mathbf{b}_M)_{M \in \mathfrak{M}}$, this rewrites as follows: The family $\left(\mathbf{b}_f\right)_{f \in \mathfrak{N}}$ is a reindexing of the family $(\mathbf{b}_M)_{M \in \mathfrak{M}}$. Hence, $\left(\mathbf{b}_f\right)_{f \in \mathfrak{N}}$ is a basis

Hence, in order to prove Lemma 6.3.7(a), it remains to prove that $(\mathbf{b}_M)_{M\in\mathfrak{M}}$ is a basis of the $\mathbf{k}$-module A if and only if $(\mathbf{b}_u)_{u\in\mathfrak{A}^*}$ is a basis of the $\mathbf{k}$-module A.

Let us show that

$$\mathbf{b}_{\mathbf{m}(M)} = \mathbf{b}_M \qquad \text{for every } M \in \mathfrak{M}. \tag{13.163.3}$$

Proof of (13.163.3): Let $M \in \mathfrak{M}$. Let $a_1, a_2, \ldots, a_k$ denote the elements of M listed in decreasing order. Then, $\mathbf{m}(M) = a_1 a_2 \cdots a_k$ (by the definition of $\mathbf{m}(M)$). Combining this with the fact that a_1, a_2, $\ldots$, a_k are Lyndon words (since they are elements of M, which is a multiset of Lyndon words) and satisfy $a_1 \geq a_2 \geq \cdots \geq a_k$ (since $a_1, a_2, \ldots, a_k$ are the elements of M listed in decreasing order), we thus conclude that $(a_1, a_2, \ldots, a_k)$ is the CFL factorization of $\mathbf{m}(M)$. Hence, the definition of $\mathbf{b}_{\mathbf{m}(M)}$ says that $\mathbf{b}_{\mathbf{m}(M)} = b_{a_1} b_{a_2} \cdots b_{a_k}$. Compared with $\mathbf{b}_M = b_{a_1} b_{a_2} \cdots b_{a_k}$ (which is just the definition of $\mathbf{b}_M$), this yields $\mathbf{b}_{\mathbf{m}(M)} = \mathbf{b}_M$. This proves (13.163.3).

Now, the family $\left(\mathbf{b}_{\mathbf{m}(M)}\right)_{M\in\mathfrak{M}}$ is a reindexing of the family $(\mathbf{b}_u)_{u\in\mathfrak{A}^*}$ (since $\mathbf{m}$ is a bijection). Since $\left(\mathbf{b}_{\mathbf{m}(M)}\right)_{M\in\mathfrak{M}} = (\mathbf{b}_M)_{M\in\mathfrak{M}}$ (by (13.163.3)), this rewrites as follows: The family $(\mathbf{b}_M)_{M\in\mathfrak{M}}$ is a reindexing of the family $(\mathbf{b}_u)_{u\in\mathfrak{A}^*}$. Hence, $(\mathbf{b}_M)_{M\in\mathfrak{M}}$ is a basis of the $\mathbf{k}$-module A if and only if $(\mathbf{b}_u)_{u\in\mathfrak{A}^*}$ is a basis of the $\mathbf{k}$-module A. As we said above, this completes our proof of Lemma 6.3.7(a).

(b) The proof of Lemma 6.3.7(b) is analogous to the above proof of Lemma 6.3.7(a).

(c) We assumed that the family $(b_w)_{w\in\mathfrak{L}}$ generates the $\mathbf{k}$-algebra A. By Lemma 6.3.7(b), this yields that the family $(\mathbf{b}_u)_{u\in\mathfrak{A}^*}$ spans the $\mathbf{k}$-module A. Recall also that the family $(g_u)_{u\in\mathfrak{A}^*}$ is a basis of the $\mathbf{k}$-module A, and thus spans this $\mathbf{k}$-module.

We need to prove that the family $(b_w)_{w\in\mathfrak{L}}$ is an algebraically independent generating set of the $\mathbf{k}$-algebra A. According to Lemma 6.3.7(a), this is equivalent to proving that the family $(\mathbf{b}_u)_{u\in\mathfrak{A}^*}$ is a basis of the $\mathbf{k}$-module A. We are going to prove the latter statement.

Let us first notice that $\mathbf{b}_u$ is a homogeneous element of A of degree $\operatorname{Wt}(u)$ for every $u \in \mathfrak{A}^*$ [1106].

Now, let $n \in \mathbb{N}$. It is easy to see that the family $(\mathbf{b}_u)_{u\in\operatorname{Wt}^{-1}(n)}$ spans the $\mathbf{k}$-module A_n (that is, the n-th homogeneous component of the $\mathbf{k}$-module A) [1107]. The same argument (but with $\mathbf{b}_u$ replaced by g_u) shows that the family $(g_u)_{u\in\operatorname{Wt}^{-1}(n)}$ spans the $\mathbf{k}$-module A_n. Since this family $(g_u)_{u\in\operatorname{Wt}^{-1}(n)}$ is linearly

of the $\mathbf{k}$-module A if and only if $(\mathbf{b}_M)_{M\in\mathfrak{M}}$ is a basis of the $\mathbf{k}$-module A. Combined with (13.163.1), this yields that $(b_w)_{w\in\mathfrak{L}}$ is an algebraically independent generating set of the $\mathbf{k}$-algebra A if and only if $(\mathbf{b}_M)_{M\in\mathfrak{M}}$ is a basis of the $\mathbf{k}$-module A, qed.

[1106] *Proof.* Let $u \in \mathfrak{A}^*$. Let $(a_1, a_2, \ldots, a_p)$ be the CFL factorization of u. Then, $a_1, a_2, \ldots, a_p$ are Lyndon words and satisfy $u = a_1 a_2 \cdots a_p$.

The definition of Wt easily yields that

$$\operatorname{Wt}(s_1 s_2 \cdots s_k) = \operatorname{Wt}(s_1) + \operatorname{Wt}(s_2) + \cdots + \operatorname{Wt}(s_k) \qquad \text{for any } k \in \mathbb{N} \text{ and any } k \text{ words } s_1, s_2, \ldots, s_k \text{ in } \mathfrak{A}^*.$$

Applying this to $k = p$ and $s_i = a_i$, we obtain $\operatorname{Wt}(a_1 a_2 \cdots a_p) = \operatorname{Wt}(a_1) + \operatorname{Wt}(a_2) + \cdots + \operatorname{Wt}(a_p)$, so that

$$\operatorname{Wt}(a_1) + \operatorname{Wt}(a_2) + \cdots + \operatorname{Wt}(a_p) = \operatorname{Wt}\left(\underbrace{a_1 a_2 \cdots a_p}_{=u}\right) = \operatorname{Wt}(u).$$

But the definition of $\mathbf{b}_u$ yields $\mathbf{b}_u = b_{a_1} b_{a_2} \cdots b_{a_p}$. Thus, the element $\mathbf{b}_u$ is homogeneous of degree $\operatorname{Wt}(a_1) + \operatorname{Wt}(a_2) + \cdots + \operatorname{Wt}(a_p)$ (since for every $w \in \mathfrak{L}$, the element b_w of A is homogeneous of degree $\operatorname{Wt}(w)$). Since $\operatorname{Wt}(a_1) + \operatorname{Wt}(a_2) + \cdots + \operatorname{Wt}(a_p) = \operatorname{Wt}(u)$, this rewrites as follows: The element $\mathbf{b}_u$ is homogeneous of degree $\operatorname{Wt}(u)$, qed.

[1107] *Proof.* For every $u \in \operatorname{Wt}^{-1}(n)$, the element $\mathbf{b}_u$ is a homogeneous element of A of degree $\operatorname{Wt}(u) = n$ (since $u \in \operatorname{Wt}^{-1}(n)$). In other words, for every $u \in \operatorname{Wt}^{-1}(n)$, we have $\mathbf{b}_u \in A_n$.

Let $\xi \in A_n$. Then, $\xi \in A_n \subset A$, so that ξ is a $\mathbf{k}$-linear combination of the elements $\mathbf{b}_u$ for $u \in \mathfrak{A}^*$ (since the family $(\mathbf{b}_u)_{u\in\mathfrak{A}^*}$ spans the $\mathbf{k}$-module A). In other words, $\xi = \sum_{u\in\mathfrak{A}^*} \lambda_u \mathbf{b}_u$ for some family $(\lambda_u)_{u\in\mathfrak{A}^*} \in \mathbf{k}^{\mathfrak{A}^*}$ of elements of $\mathbf{k}$ such that all but finitely many $u \in \mathfrak{A}^*$ satisfy $\lambda_u = 0$. Consider this $(\lambda_u)_{u\in\mathfrak{A}^*}$.

What happens if we apply the canonical projection $A \to A_n$ (which projects A onto its n-th homogeneous component A_n, annihilating all other components) to both sides of the equality $\xi = \sum_{u\in\mathfrak{A}^*} \lambda_u \mathbf{b}_u$? The left hand side remains ξ (since $\xi \in A_n$). On the right hand side, all addends of the sum in which the u satisfies $\operatorname{Wt}(u) = n$ stay fixed (because we know that for each such u, the element $\mathbf{b}_u$ is a homogeneous element of A of degree $\operatorname{Wt}(u) = n$), whereas all other addends become 0 (for a similar reason); therefore, the sum on the right hand side becomes $\sum_{\substack{u\in\mathfrak{A}^*;\\ \operatorname{Wt}(u)=n}} \lambda_u \mathbf{b}_u$. Thus, the equality becomes $\xi = \sum_{\substack{u\in\mathfrak{A}^*;\\ \operatorname{Wt}(u)=n}} \lambda_u \mathbf{b}_u$. Thus,

$$\xi = \sum_{\substack{u\in\mathfrak{A}^*;\\ \operatorname{Wt}(u)=n}} \lambda_u \mathbf{b}_u = \sum_{u\in\operatorname{Wt}^{-1}(n)} \lambda_u \mathbf{b}_u.$$

Hence, ξ is a $\mathbf{k}$-linear combination of the elements $\mathbf{b}_u$ with $u \in \operatorname{Wt}^{-1}(n)$.

independent (because it is a subfamily of the basis $(g_u)_{u\in\mathfrak{A}^*}$ of A), this shows that the family $(g_u)_{u\in\operatorname{Wt}^{-1}(n)}$ is a basis of the $\mathbf{k}$-module A_n.

But the set $\operatorname{Wt}^{-1}(n)$ is finite[1108]. Hence, A_n is a finite free $\mathbf{k}$-module (since $(g_u)_{u\in\operatorname{Wt}^{-1}(n)}$ is a basis of the $\mathbf{k}$-module A_n), and Exercise 2.5.18(b) (applied to A_n, $\operatorname{Wt}^{-1}(n)$, u, g_u and $\mathbf{b}_u$ instead of A, I, i, γ_i and β_i) yields that $(\mathbf{b}_u)_{u\in\operatorname{Wt}^{-1}(n)}$ is a $\mathbf{k}$-basis of A_n.

Now, let us forget that we fixed n. We thus have shown that for every $n\in\mathbb{N}$, the family $(\mathbf{b}_u)_{u\in\operatorname{Wt}^{-1}(n)}$ is a $\mathbf{k}$-basis of A_n. Hence, the family $(\mathbf{b}_u)_{u\in\mathfrak{A}^*}$ (being the disjoint union of the families $(\mathbf{b}_u)_{u\in\operatorname{Wt}^{-1}(n)}$ over all $n\in\mathbb{N}$) is a $\mathbf{k}$-basis of $\bigoplus_{n\in\mathbb{N}} A_n = A$. In other words, the family $(\mathbf{b}_u)_{u\in\mathfrak{A}^*}$ is a basis of the $\mathbf{k}$-module A. As we know, this completes the proof of Lemma 6.3.7(c). □

13.164. **Solution to Exercise 6.3.11.** *Solution to Exercise 6.3.11.*

Proof of Lemma 6.3.10. (a) Let u, v and v' be three words satisfying $\ell(u)=n$, $\ell(v)=m$, $\ell(v')=m$ and $v'<v$. We must show that $u \underset{\sigma}{\sqcup\!\sqcup} v' < u \underset{\sigma}{\sqcup\!\sqcup} v$.

We have $v'<v$, thus $v'\leq v$. By the definition of the relation $\leq$, this means that

$$\textbf{either} \text{ there exists an } i\in\{1,2,\ldots,\min\{\ell(v'),\ell(v)\}\}$$
$$\text{such that } \left((v')_i < v_i, \text{ and every } j\in\{1,2,\ldots,i-1\} \text{ satisfies } (v')_j = v_j\right),$$
$$\textbf{or} \text{ the word } v' \text{ is a prefix of } v.$$

Since the word v' cannot be a prefix of v (because this would entail that $v'=v$ (because $\ell(v')=m=\ell(v)$, so that v' has the same length as v), which would contradict $v'<v$), this shows that there exists an $i\in\{1,2,\ldots,\min\{\ell(v'),\ell(v)\}\}$ such that $\left((v')_i<v_i, \text{ and every } j\in\{1,2,\ldots,i-1\} \text{ satisfies } (v')_j=v_j\right)$. Denote this i by k. Thus, $k\in\{1,2,\ldots,\min\{\ell(v'),\ell(v)\}\}$ has the property that $(v')_k<v_k$, and

$$\text{every } j\in\{1,2,\ldots,k-1\} \text{ satisfies } (v')_j=v_j. \tag{13.164.1}$$

Now, let us forget that we fixed ξ. We thus have shown that every $\xi\in A_n$ is a $\mathbf{k}$-linear combination of the elements $\mathbf{b}_u$ with $u\in\operatorname{Wt}^{-1}(n)$. Since all these elements $\mathbf{b}_u$ belong to A_n (because for every $u\in\operatorname{Wt}^{-1}(n)$, we have $\mathbf{b}_u\in A_n$), this shows that the family $(\mathbf{b}_u)_{u\in\operatorname{Wt}^{-1}(n)}$ spans the $\mathbf{k}$-module A_n, qed.

[1108] *Proof.* We have

$$\begin{aligned}
\operatorname{Wt}^{-1}(n) &= \{w\in\mathfrak{A}^* \mid \operatorname{Wt}(w)=n\}\\
&= \bigcup_{k\in\mathbb{N}} \left\{ (w_1,w_2,\ldots,w_k)\in\mathfrak{A}^* \mid \underbrace{\operatorname{Wt}((w_1,w_2,\ldots,w_k))}_{\substack{=\operatorname{wt}(w_1)+\operatorname{wt}(w_2)+\cdots+\operatorname{wt}(w_k)\\ \text{(by the definition of } \operatorname{Wt}((w_1,w_2,\ldots,w_k)))}} = n \right\}\\
&\qquad \left(\text{since every word } w\in\mathfrak{A}^* \text{ has the form } (w_1,w_2,\ldots,w_k) \text{ for some } k\in\mathbb{N}\right)\\
&= \bigcup_{k\in\mathbb{N}} \underbrace{\{(w_1,w_2,\ldots,w_k)\in\mathfrak{A}^* \mid \operatorname{wt}(w_1)+\operatorname{wt}(w_2)+\cdots+\operatorname{wt}(w_k)=n\}}_{=\bigcup_{\substack{(i_1,i_2,\ldots,i_k)\in\{1,2,3,\ldots\}^k;\\ i_1+i_2+\cdots+i_k=n}} \{(w_1,w_2,\ldots,w_k)\in\mathfrak{A}^* \mid \operatorname{wt}(w_1)=i_1,\ \operatorname{wt}(w_2)=i_2,\ \ldots,\ \operatorname{wt}(w_k)=i_k\}}\\
&= \underbrace{\bigcup_{k\in\mathbb{N}} \bigcup_{\substack{(i_1,i_2,\ldots,i_k)\in\{1,2,3,\ldots\}^k;\\ i_1+i_2+\cdots+i_k=n}}}_{=\bigcup_{(i_1,i_2,\ldots,i_k)\in\operatorname{Comp}_n}} \underbrace{\{(w_1,w_2,\ldots,w_k)\in\mathfrak{A}^* \mid \operatorname{wt}(w_1)=i_1,\ \operatorname{wt}(w_2)=i_2,\ \ldots,\ \operatorname{wt}(w_k)=i_k\}}_{=\operatorname{wt}^{-1}(i_1)\times\operatorname{wt}^{-1}(i_2)\times\cdots\times\operatorname{wt}^{-1}(i_k)}\\
&= \bigcup_{(i_1,i_2,\ldots,i_k)\in\operatorname{Comp}_n} \underbrace{\operatorname{wt}^{-1}(i_1)\times\operatorname{wt}^{-1}(i_2)\times\cdots\times\operatorname{wt}^{-1}(i_k)}_{\substack{\text{a finite set}\\ \text{(since for every } N\in\{1,2,3,\ldots\}\text{, the set } \operatorname{wt}^{-1}(N) \text{ is finite)}}} .
\end{aligned}$$

Hence, $\operatorname{Wt}^{-1}(n)$ is a union of finitely many finite sets, and thus itself finite, qed.

We have $k \in \left\{1, 2, \ldots, \min\left\{\underbrace{\ell\left(v'\right)}_{=m}, \underbrace{\ell\left(v\right)}_{=m}\right\}\right\} = \left\{1, 2, \ldots, \underbrace{\min\left\{m, m\right\}}_{=m}\right\} = \{1, 2, \ldots, m\}$.

Now, let $(w_1, w_2, \ldots, w_{n+m})$ denote the concatenation $u \cdot v = (u_1, u_2, \ldots, u_n, v_1, v_2, \ldots, v_m)$, and let $\left(w'_1, w'_2, \ldots, w'_{n+m}\right)$ denote the concatenation $u \cdot v' = \left(u_1, u_2, \ldots, u_n, (v')_1, (v')_2, \ldots, (v')_m\right)$. We have $u \underset{\sigma}{\sqcup\!\sqcup} v = \left(w_{\sigma(1)}, w_{\sigma(2)}, \ldots, w_{\sigma(n+m)}\right)$ (by the definition of $u \underset{\sigma}{\sqcup\!\sqcup} v$) and $u \underset{\sigma}{\sqcup\!\sqcup} v' = \left(w'_{\sigma(1)}, w'_{\sigma(2)}, \ldots, w'_{\sigma(n+m)}\right)$ (by the definition of $u \underset{\sigma}{\sqcup\!\sqcup} v'$). Hence, we have $u \underset{\sigma}{\sqcup\!\sqcup} v' \neq u \underset{\sigma}{\sqcup\!\sqcup} v$ [1109]. But our goal is to prove that $u \underset{\sigma}{\sqcup\!\sqcup} v' < u \underset{\sigma}{\sqcup\!\sqcup} v$. Hence, it remains to prove that $u \underset{\sigma}{\sqcup\!\sqcup} v' \leq u \underset{\sigma}{\sqcup\!\sqcup} v$ (since we have shown that $u \underset{\sigma}{\sqcup\!\sqcup} v' \neq u \underset{\sigma}{\sqcup\!\sqcup} v$). Due to the definition of the relation $\leq$, this amounts to proving that

> **either** there exists an $i \in \left\{1, 2, \ldots, \min\left\{\ell\left(u \underset{\sigma}{\sqcup\!\sqcup} v'\right), \ell\left(u \underset{\sigma}{\sqcup\!\sqcup} v\right)\right\}\right\}$ such that
> $$\left(\left(u \underset{\sigma}{\sqcup\!\sqcup} v'\right)_i < \left(u \underset{\sigma}{\sqcup\!\sqcup} v\right)_i, \text{ and every } j \in \{1, 2, \ldots, i-1\} \text{ satisfies } \left(u \underset{\sigma}{\sqcup\!\sqcup} v'\right)_j = \left(u \underset{\sigma}{\sqcup\!\sqcup} v\right)_j\right),$$
> **or** the word $u \underset{\sigma}{\sqcup\!\sqcup} v'$ is a prefix of $u \underset{\sigma}{\sqcup\!\sqcup} v$.

We shall prove that the first of these two alternatives holds, i.e., that there exists an

$$i \in \left\{1, 2, \ldots, \min\left\{\ell\left(u \underset{\sigma}{\sqcup\!\sqcup} v'\right), \ell\left(u \underset{\sigma}{\sqcup\!\sqcup} v\right)\right\}\right\}$$

such that

$$\left(\left(u \underset{\sigma}{\sqcup\!\sqcup} v'\right)_i < \left(u \underset{\sigma}{\sqcup\!\sqcup} v\right)_i, \text{ and every } j \in \{1, 2, \ldots, i-1\} \text{ satisfies } \left(u \underset{\sigma}{\sqcup\!\sqcup} v'\right)_j = \left(u \underset{\sigma}{\sqcup\!\sqcup} v\right)_j\right).$$

Indeed, we claim that $\sigma^{-1}(n+k)$ is such an i. In order to conclude the proof, we then need to show that

$$\sigma^{-1}(n+k) \in \left\{1, 2, \ldots, \min\left\{\ell\left(u \underset{\sigma}{\sqcup\!\sqcup} v'\right), \ell\left(u \underset{\sigma}{\sqcup\!\sqcup} v\right)\right\}\right\}, \tag{13.164.2}$$

that we have

$$\left(u \underset{\sigma}{\sqcup\!\sqcup} v'\right)_{\sigma^{-1}(n+k)} < \left(u \underset{\sigma}{\sqcup\!\sqcup} v\right)_{\sigma^{-1}(n+k)}, \tag{13.164.3}$$

and that

$$\text{every } j \in \left\{1, 2, \ldots, \sigma^{-1}(n+k) - 1\right\} \text{ satisfies } \left(u \underset{\sigma}{\sqcup\!\sqcup} v'\right)_j = \left(u \underset{\sigma}{\sqcup\!\sqcup} v\right)_j. \tag{13.164.4}$$

Proof of (13.164.2): We have $\ell\left(u \underset{\sigma}{\sqcup\!\sqcup} v\right) = \underbrace{\ell(u)}_{=n} + \underbrace{\ell(v)}_{=m} = n + m$ and similarly $\ell\left(u \underset{\sigma}{\sqcup\!\sqcup} v'\right) = n + m$. Thus, $\min\left\{\underbrace{\ell\left(u \underset{\sigma}{\sqcup\!\sqcup} v'\right)}_{=n+m}, \underbrace{\ell\left(u \underset{\sigma}{\sqcup\!\sqcup} v\right)}_{=n+m}\right\} = \min\{n+m, n+m\} = n + m$. But since $\sigma \in \operatorname{Sh}_{n,m} \subset \mathfrak{S}_{n+m}$, we have $\sigma^{-1}(n+k) \in \{1, 2, \ldots, n+m\}$. In other words, $\sigma^{-1}(n+k) \in \left\{1, 2, \ldots, \min\left\{\ell\left(u \underset{\sigma}{\sqcup\!\sqcup} v'\right), \ell\left(u \underset{\sigma}{\sqcup\!\sqcup} v\right)\right\}\right\}$ (since $\min\left\{\ell\left(u \underset{\sigma}{\sqcup\!\sqcup} v'\right), \ell\left(u \underset{\sigma}{\sqcup\!\sqcup} v\right)\right\} = n + m$). This proves (13.164.2).

Proof of (13.164.3): Since $u \underset{\sigma}{\sqcup\!\sqcup} v = \left(w_{\sigma(1)}, w_{\sigma(2)}, \ldots, w_{\sigma(n+m)}\right)$, we have $\left(u \underset{\sigma}{\sqcup\!\sqcup} v\right)_j = w_{\sigma(j)}$ for every $j \in \{1, 2, \ldots, n+m\}$. Applying this to $j = \sigma^{-1}(n+k)$, we obtain $\left(u \underset{\sigma}{\sqcup\!\sqcup} v\right)_{\sigma^{-1}(n+k)} = w_{\sigma(\sigma^{-1}(n+k))} = w_{n+k} = v_k$ (since $k \in \{1, 2, \ldots, m\}$ and $(w_1, w_2, \ldots, w_{n+m}) = (u_1, u_2, \ldots, u_n, v_1, v_2, \ldots, v_m)$). Similarly,

[1109] *Proof.* Assume the contrary. Then, $u \underset{\sigma}{\sqcup\!\sqcup} v' = u \underset{\sigma}{\sqcup\!\sqcup} v$, thus $\left(w'_{\sigma(1)}, w'_{\sigma(2)}, \ldots, w'_{\sigma(n+m)}\right) = u \underset{\sigma}{\sqcup\!\sqcup} v' = u \underset{\sigma}{\sqcup\!\sqcup} v = \left(w_{\sigma(1)}, w_{\sigma(2)}, \ldots, w_{\sigma(n+m)}\right)$. Hence, $\left(w'_1, w'_2, \ldots, w'_{n+m}\right) = (w_1, w_2, \ldots, w_{n+m})$ (since σ is a permutation), and thus $u \cdot v' = \left(w'_1, w'_2, \ldots, w'_{n+m}\right) = (w_1, w_2, \ldots, w_{n+m}) = u \cdot v$, so that $v' = v$ (since u can be cancelled from the equality $u \cdot v' = u \cdot v$). But this contradicts $v' < v$. This contradiction shows that our assumption was wrong, qed.

$\left(u \underset{\sigma}{\sqcup\!\sqcup} v'\right)_{\sigma^{-1}(n+k)} = (v')_k$. Recalling that $(v')_k < v_k$, we now see that $\left(u \underset{\sigma}{\sqcup\!\sqcup} v'\right)_{\sigma^{-1}(n+k)} = (v')_k < v_k = \left(u \underset{\sigma}{\sqcup\!\sqcup} v\right)_{\sigma^{-1}(n+k)}$. This proves (13.164.3).

Proof of (13.164.4): Let $j \in \left\{1, 2, \ldots, \sigma^{-1}(n+k) - 1\right\}$. We need to prove that $\left(u \underset{\sigma}{\sqcup\!\sqcup} v'\right)_j = \left(u \underset{\sigma}{\sqcup\!\sqcup} v\right)_j$.

Assume the contrary. Then, $\left(u \underset{\sigma}{\sqcup\!\sqcup} v'\right)_j \neq \left(u \underset{\sigma}{\sqcup\!\sqcup} v\right)_j$.

We have $j \in \{1, 2, \ldots, n+m\}$ and $j < \sigma^{-1}(n+k)$ (since $j \in \left\{1, 2, \ldots, \sigma^{-1}(n+k) - 1\right\}$).

Since $u \underset{\sigma}{\sqcup\!\sqcup} v = \left(w_{\sigma(1)}, w_{\sigma(2)}, \ldots, w_{\sigma(n+m)}\right)$, we have $\left(u \underset{\sigma}{\sqcup\!\sqcup} v\right)_j = w_{\sigma(j)}$. Similarly, $\left(u \underset{\sigma}{\sqcup\!\sqcup} v'\right)_j = w'_{\sigma(j)}$. Hence, $w'_{\sigma(j)} = \left(u \underset{\sigma}{\sqcup\!\sqcup} v'\right)_j \neq \left(u \underset{\sigma}{\sqcup\!\sqcup} v\right)_j = w_{\sigma(j)}$.

If we had $\sigma(j) \leq n$, then we would have $w_{\sigma(j)} = u_{\sigma(j)}$ (since $(w_1, w_2, \ldots, w_{n+m}) = (u_1, u_2, \ldots, u_n, v_1, v_2, \ldots, v_m)$) and $w'_{\sigma(j)} = u_{\sigma(j)}$ (for similar reasons), which would yield that $w'_{\sigma(j)} = u_{\sigma(j)} = w_{\sigma(j)}$, which would contradict $w'_{\sigma(j)} \neq w_{\sigma(j)}$. Hence, we cannot have $\sigma(j) \leq n$. We thus must have $\sigma(j) > n$, whence $\sigma(j) \in \{n+1, n+2, \ldots, n+m\}$. Consequently, $w_{\sigma(j)} = v_{\sigma(j)-n}$ (because $(w_1, w_2, \ldots, w_{n+m}) = (u_1, u_2, \ldots, u_n, v_1, v_2, \ldots, v_m)$) and $(w')_{\sigma(j)} = (v')_{\sigma(j)-n}$ (similarly).

If we had $\sigma(j) - n \in \{1, 2, \ldots, k-1\}$, then we would have $(v')_{\sigma(j)-n} = v_{\sigma(j)-n}$ (by (13.164.1), applied to $\sigma(j) - n$ instead of j). Hence, if we had $\sigma(j) - n \in \{1, 2, \ldots, k-1\}$, then we would have $(w')_{\sigma(j)} = (v')_{\sigma(j)-n} = v_{\sigma(j)-n} = w_{\sigma(j)}$, which would contradict $w'_{\sigma(j)} \neq w_{\sigma(j)}$. Hence, we cannot have $\sigma(j) - n \in \{1, 2, \ldots, k-1\}$. In other words, we have $\sigma(j) - n \notin \{1, 2, \ldots, k-1\}$, so that $\sigma(j) - n \geq k$. Hence, $\sigma(j) \geq n+k$.

We have $\sigma \in \mathrm{Sh}_{n,m}$, so that $\sigma^{-1}(1) < \sigma^{-1}(2) < \cdots < \sigma^{-1}(n)$ and $\sigma^{-1}(n+1) < \sigma^{-1}(n+2) < \cdots < \sigma^{-1}(n+m)$. In particular, the restriction of the map σ^{-1} to the set $\{n+1, n+2, \ldots, n+m\}$ is strictly increasing (since $\sigma^{-1}(n+1) < \sigma^{-1}(n+2) < \cdots < \sigma^{-1}(n+m)$). Since $\sigma(j)$ and $n+k$ both lie in this set $\{n+1, n+2, \ldots, n+m\}$, we thus have $\sigma^{-1}(\sigma(j)) \geq \sigma^{-1}(n+k)$ (because $\sigma(j) \geq n+k$). Hence, $j = \sigma^{-1}(\sigma(j)) \geq \sigma^{-1}(n+k)$, which contradicts $j < \sigma^{-1}(n+k)$. This contradiction shows that our assumption was wrong. Hence, (13.164.4) is proven.

Now that (13.164.2), (13.164.3) and (13.164.4) are all proven, we conclude that there exists an

$$i \in \left\{1, 2, \ldots, \min\left\{\ell\left(u \underset{\sigma}{\sqcup\!\sqcup} v'\right), \ell\left(u \underset{\sigma}{\sqcup\!\sqcup} v\right)\right\}\right\}$$

such that

$$\left(\left(u \underset{\sigma}{\sqcup\!\sqcup} v'\right)_i < \left(u \underset{\sigma}{\sqcup\!\sqcup} v\right)_i, \text{ and every } j \in \{1, 2, \ldots, i-1\} \text{ satisfies } \left(u \underset{\sigma}{\sqcup\!\sqcup} v'\right)_j = \left(u \underset{\sigma}{\sqcup\!\sqcup} v\right)_j\right)$$

(namely, $i = \sigma^{-1}(n+k)$). This concludes the proof of Lemma 6.3.10(a).

(b) The proof of Lemma 6.3.10(b) is similar to the proof of Lemma 6.3.10(a) above. (One of the changes necessary is to replace $\sigma^{-1}(n+k)$ by $\sigma^{-1}(k)$.)

(Alternatively, it is not hard to derive Lemma 6.3.10(b) from Lemma 6.3.10(a), because if $\tau \in \mathfrak{S}_{n+m}$ denotes the permutation which is written $(m+1, m+2, \ldots, n+m, 1, 2, \ldots, m)$ in one-line notation, then the permutation $\tau \circ \sigma$ belongs to $\mathrm{Sh}_{m,n}$ and satisfies $u \underset{\sigma}{\sqcup\!\sqcup} v = v \underset{\tau\circ\sigma}{\sqcup\!\sqcup} u$ and $u' \underset{\sigma}{\sqcup\!\sqcup} v = v \underset{\tau\circ\sigma}{\sqcup\!\sqcup} u'$, and therefore we can obtain Lemma 6.3.10(b) by applying Lemma 6.3.10(a) to m, n, v, u, u' and $\tau \circ \sigma$ instead of n, m, u, v, v' and σ.)

(c) Let u, v and v' be three words satisfying $\ell(u) = n$, $\ell(v) = m$, $\ell(v') = m$ and $v' \leq v$. We must show that $u \underset{\sigma}{\sqcup\!\sqcup} v' \leq u \underset{\sigma}{\sqcup\!\sqcup} v$. This is obvious if $v' = v$ (in fact, if $v' = v$, then $u \underset{\sigma}{\sqcup\!\sqcup} v' = u \underset{\sigma}{\sqcup\!\sqcup} v \leq u \underset{\sigma}{\sqcup\!\sqcup} v$). Hence, we can WLOG assume that $v' \neq v$. Assuming this, we immediately obtain $v' < v$ (since $v' \neq v$ and $v' \leq v$), so that $u \underset{\sigma}{\sqcup\!\sqcup} v' < u \underset{\sigma}{\sqcup\!\sqcup} v$ (by Lemma 6.3.10(a)). Thus, of course, $u \underset{\sigma}{\sqcup\!\sqcup} v' \leq u \underset{\sigma}{\sqcup\!\sqcup} v$, and Lemma 6.3.10(c) is proven. □

13.165. **Solution to Exercise 6.3.12.** *Solution to Exercise 6.3.12.*

Proof of Proposition 6.3.9. We shall prove Proposition 6.3.9 by strong induction over ℓ. So we fix some $L \in \mathbb{N}$, and we assume that Proposition 6.3.9 holds whenever $\ell < L$. We now need to prove that Proposition

6.3.9 holds for $\ell = L$. In other words, we need to prove that for every word $x \in \mathfrak{A}^L$, there is a family $(\eta_{x,y})_{y\in\mathfrak{A}^L} \in \mathbb{N}^{\mathfrak{A}^L}$ of elements of $\mathbb{N}$ satisfying

$$\mathbf{b}_x = \sum_{\substack{y\in\mathfrak{A}^L;\\ y\leq x}} \eta_{x,y} b_y \tag{13.165.1}$$

and $\eta_{x,x} \neq 0$ (in $\mathbb{N}$).

Let $x \in \mathfrak{A}^L$ be a word. We need to prove that there is a family $(\eta_{x,y})_{y\in\mathfrak{A}^L} \in \mathbb{N}^{\mathfrak{A}^L}$ of elements of $\mathbb{N}$ satisfying (13.165.1) and $\eta_{x,x} \neq 0$.

Let $(a_1, a_2, \ldots, a_p)$ be the CFL factorization of x. Then, a_1, a_2, $\ldots$, a_p are Lyndon words satisfying $x = a_1 a_2 \cdots a_p$ and $a_1 \geq a_2 \geq \cdots \geq a_p$.

If x is the empty word, then our claim is trivial (in fact, we can just set $\eta_{x,x} = 1$ in this case, and (13.165.1) holds obviously). Hence, for the rest of this proof, we WLOG assume that x is not the empty word. Thus, $p \neq 0$ (because otherwise, $x = a_1 a_2 \cdots a_p$ would be an empty product and thus the empty word, contradicting the assumption that x is not the empty word). Hence, we can define two words $u \in \mathfrak{A}^*$ and $v \in \mathfrak{A}^*$ by $u = a_1$ and $v = a_2 a_3 \cdots a_p$. The word u is Lyndon (since $u = a_1$ and since a_1 is Lyndon), and thus has (u) as its CFL factorization. The CFL factorization of the word v is $(a_2, a_3, \ldots, a_p)$ (since the words a_2, a_3, $\ldots$, a_p are Lyndon and satisfy $v = a_2 a_3 \cdots a_p$ and $a_2 \geq a_3 \geq \cdots \geq a_p$ (because $a_1 \geq a_2 \geq \cdots \geq a_p$)). Also, $u = a_1 \geq a_{j+1}$ for every $i \in \{1, 2, \ldots, 1\}$ and $j \in \{1, 2, \ldots, p-1\}$ (because $a_1 \geq a_2 \geq \cdots \geq a_p$). Hence, we can apply Theorem 6.2.2(c) to 1, (u), $p-1$ and $(a_2, a_3, \ldots, a_p)$ instead of p, $(a_1, a_2, \ldots, a_p)$, q and $(b_1, b_2, \ldots, b_q)$. As a result, we conclude that the lexicographically highest element of the multiset $u \sqcup\!\sqcup v$ is $\underbrace{u}_{=a_1}\underbrace{v}_{=a_2a_3\cdots a_p} = a_1 (a_2 a_3 \cdots a_p) = a_1 a_2 \cdots a_p = x$.

But $\mathbf{b}_u = b_u$ (by the definition of $\mathbf{b}_u$, since u has CFL factorization (u)), and $\mathbf{b}_x = \mathbf{b}_u \sqcup\!\sqcup \mathbf{b}_v$ [1110].

The word u is Lyndon and thus nonempty, so that $\ell(u) > 0$. Now, $\ell\left(\underbrace{x}_{=uv}\right) = \ell(uv) = \underbrace{\ell(u)}_{>0} + \ell(v) > \ell(v)$, so that $\ell(v) < \ell(x) = L$ (since $x \in \mathfrak{A}^L$). Hence, the induction hypothesis tells us that we can apply Proposition 6.3.9 to $\ell(v)$ and v instead of ℓ and x (since $v \in \mathfrak{A}^{\ell(v)}$). As a result, we see that there is a family $(\eta_{v,y})_{y\in\mathfrak{A}^{\ell(v)}} \in \mathbb{N}^{\mathfrak{A}^{\ell(v)}}$ of elements of $\mathbb{N}$ satisfying

$$\mathbf{b}_v = \sum_{\substack{y\in\mathfrak{A}^{\ell(v)};\\ y\leq v}} \eta_{v,y} b_y$$

and $\eta_{v,v} \neq 0$ (in $\mathbb{N}$). Consider this family $(\eta_{v,y})_{y\in\mathfrak{A}^{\ell(v)}}$.

Now,

$$\begin{aligned}
\mathbf{b}_x &= \underbrace{\mathbf{b}_u}_{=b_u} \sqcup\!\sqcup \underbrace{\mathbf{b}_v}_{=\sum_{\substack{y\in\mathfrak{A}^{\ell(v)};\\ y\leq v}} \eta_{v,y} b_y} = b_u \sqcup\!\sqcup \left(\sum_{\substack{y\in\mathfrak{A}^{\ell(v)};\\ y\leq v}} \eta_{v,y} b_y \right) = \sum_{\substack{y\in\mathfrak{A}^{\ell(v)};\\ y\leq v}} \eta_{v,y} \underbrace{b_u \sqcup\!\sqcup b_y}_{\substack{=\sum_{\sigma\in\mathrm{Sh}_{\ell(u),\ell(v)}} b_{u \underset{\sigma}{\sqcup\!\sqcup} y} \\ \text{(by Remark 6.3.2, applied to} \\ y,\ \ell(u) \text{ and } \ell(v) \\ \text{instead of } v,\ n \text{ and } m)}} \\
&= \sum_{\substack{y\in\mathfrak{A}^{\ell(v)};\\ y\leq v}} \eta_{v,y} \sum_{\sigma\in\mathrm{Sh}_{\ell(u),\ell(v)}} b_{u \underset{\sigma}{\sqcup\!\sqcup} y} = \sum_{\substack{z\in\mathfrak{A}^{\ell(v)};\\ z\leq v}} \eta_{v,z} \sum_{\sigma\in\mathrm{Sh}_{\ell(u),\ell(v)}} b_{u \underset{\sigma}{\sqcup\!\sqcup} z} \qquad (13.165.2)
\end{aligned}$$

[1110] *Proof.* Since the CFL factorization of v is $(a_2, a_3, \ldots, a_p)$, we have $\mathbf{b}_v = b_{a_2} \sqcup\!\sqcup b_{a_3} \sqcup\!\sqcup \cdots \sqcup\!\sqcup b_{a_p}$ (by the definition of $\mathbf{b}_v$). But since the CFL factorization of x is $(a_1, a_2, \ldots, a_p)$, we have

$$\begin{aligned}
\mathbf{b}_x &= b_{a_1} \sqcup\!\sqcup b_{a_2} \sqcup\!\sqcup \cdots \sqcup\!\sqcup b_{a_p} \qquad \text{(by the definition of } \mathbf{b}_x\text{)} \\
&= \underbrace{b_{a_1}}_{\substack{=b_u \\ \text{(since } a_1=u)}} \sqcup\!\sqcup \underbrace{\left(b_{a_2} \sqcup\!\sqcup b_{a_3} \sqcup\!\sqcup \cdots \sqcup\!\sqcup b_{a_p}\right)}_{=\mathbf{b}_v} = \underbrace{b_u}_{\substack{=\mathbf{b}_u \\ \text{(since } \mathbf{b}_u=b_u)}} \sqcup\!\sqcup \mathbf{b}_v = \mathbf{b}_u \sqcup\!\sqcup \mathbf{b}_v,
\end{aligned}$$

qed.

(here, we renamed the summation index y as z).

Now, let $z \in \mathfrak{A}^{\ell(v)}$ and $\sigma \in \operatorname{Sh}_{\ell(u),\ell(v)}$ be such that $z \leq v$. We will prove that $u \underset{\sigma}{\sqcup\!\sqcup} z \in \mathfrak{A}^L$ and $u \underset{\sigma}{\sqcup\!\sqcup} z \leq x$. First of all, it is clear that $\ell\left(u \underset{\sigma}{\sqcup\!\sqcup} z\right) = \ell(u) + \underbrace{\ell(z)}_{\substack{=\ell(v) \\ (\text{since } z \in \mathfrak{A}^{\ell(v)})}} = \ell(u) + \ell(v) = \ell\left(\underbrace{uv}_{=x}\right) = \ell(x) = L$, so that $u \underset{\sigma}{\sqcup\!\sqcup} z \in \mathfrak{A}^L$. Applying Lemma 6.3.10(c) to $\ell(u)$, $\ell(v)$ and z instead of n, m and v', we obtain $u \underset{\sigma}{\sqcup\!\sqcup} z \leq u \underset{\sigma}{\sqcup\!\sqcup} v$. But $u \underset{\sigma}{\sqcup\!\sqcup} v$ is an element of the multiset $u \sqcup\!\sqcup v$, and thus is $\leq x$ (since the lexicographically highest element of the multiset $u \sqcup\!\sqcup v$ is x). Thus, $u \underset{\sigma}{\sqcup\!\sqcup} v \leq x$, so that $u \underset{\sigma}{\sqcup\!\sqcup} z \leq u \underset{\sigma}{\sqcup\!\sqcup} v \leq x$.

Now, let us forget that we fixed z and σ. We thus have shown that

$$\text{any } z \in \mathfrak{A}^{\ell(v)} \text{ and } \sigma \in \operatorname{Sh}_{\ell(u),\ell(v)} \text{ satisfying } z \leq v \text{ satisfy } u \underset{\sigma}{\sqcup\!\sqcup} z \in \mathfrak{A}^L \text{ and } u \underset{\sigma}{\sqcup\!\sqcup} z \leq x. \tag{13.165.3}$$

A similar argument (but with some of the $\leq$ signs replaced by $<$ signs, and with a reference to Lemma 6.3.10(a) instead of a reference to Lemma 6.3.10(c)) shows that

$$\text{any } z \in \mathfrak{A}^{\ell(v)} \text{ and } \sigma \in \operatorname{Sh}_{\ell(u),\ell(v)} \text{ satisfying } z < v \text{ satisfy } u \underset{\sigma}{\sqcup\!\sqcup} z \in \mathfrak{A}^L \text{ and } u \underset{\sigma}{\sqcup\!\sqcup} z < x. \tag{13.165.4}$$

Now, (13.165.2) becomes

$$\begin{aligned}
\mathbf{b}_x &= \sum_{\substack{z \in \mathfrak{A}^{\ell(v)};\\ z \leq v}} \eta_{v,z} \underbrace{\sum_{\sigma \in \operatorname{Sh}_{\ell(u),\ell(v)}} b_{u \underset{\sigma}{\sqcup\!\sqcup} z}}_{\substack{= \sum\limits_{\substack{y \in \mathfrak{A}^L;\\ y \leq x}} \sum\limits_{\substack{\sigma \in \operatorname{Sh}_{\ell(u),\ell(v)};\\ u \underset{\sigma}{\sqcup\!\sqcup} z = y}} b_{u \underset{\sigma}{\sqcup\!\sqcup} z} \\ (\text{due to (13.165.3)})}} = \sum_{\substack{z \in \mathfrak{A}^{\ell(v)};\\ z \leq v}} \eta_{v,z} \sum_{\substack{y \in \mathfrak{A}^L;\\ y \leq x}} \sum_{\substack{\sigma \in \operatorname{Sh}_{\ell(u),\ell(v)};\\ u \underset{\sigma}{\sqcup\!\sqcup} z = y}} b_{u \underset{\sigma}{\sqcup\!\sqcup} z} \\
&= \sum_{\substack{y \in \mathfrak{A}^L;\\ y \leq x}} \sum_{\substack{z \in \mathfrak{A}^{\ell(v)};\\ z \leq v}} \eta_{v,z} \sum_{\substack{\sigma \in \operatorname{Sh}_{\ell(u),\ell(v)};\\ u \underset{\sigma}{\sqcup\!\sqcup} z = y}} \underbrace{b_{u \underset{\sigma}{\sqcup\!\sqcup} z}}_{\substack{=b_y \\ (\text{since } u \underset{\sigma}{\sqcup\!\sqcup} z = y)}} = \sum_{\substack{y \in \mathfrak{A}^L;\\ y \leq x}} \sum_{\substack{z \in \mathfrak{A}^{\ell(v)};\\ z \leq v}} \eta_{v,z} \underbrace{\sum_{\substack{\sigma \in \operatorname{Sh}_{\ell(u),\ell(v)};\\ u \underset{\sigma}{\sqcup\!\sqcup} z = y}} b_y}_{= \left| \left\{ \sigma \in \operatorname{Sh}_{\ell(u),\ell(v)} \ \mid \ u \underset{\sigma}{\sqcup\!\sqcup} z = y \right\} \right| \cdot b_y} \\
&= \sum_{\substack{y \in \mathfrak{A}^L;\\ y \leq x}} \sum_{\substack{z \in \mathfrak{A}^{\ell(v)};\\ z \leq v}} \eta_{v,z} \left| \left\{ \sigma \in \operatorname{Sh}_{\ell(u),\ell(v)} \ \mid \ u \underset{\sigma}{\sqcup\!\sqcup} z = y \right\} \right| \cdot b_y. \qquad (13.165.5)
\end{aligned}$$

Recall that we must prove that there is a family $(\eta_{x,y})_{y \in \mathfrak{A}^L} \in \mathbb{N}^{\mathfrak{A}^L}$ of elements of $\mathbb{N}$ satisfying (13.165.1) and $\eta_{x,x} \neq 0$ (in $\mathbb{N}$). In order to prove this, we define such a family $(\eta_{x,y})_{y \in \mathfrak{A}^L} \in \mathbb{N}^{\mathfrak{A}^L}$ by setting

$$\left(\eta_{x,y} = \sum_{\substack{z \in \mathfrak{A}^{\ell(v)};\\ z \leq v}} \eta_{v,z} \left| \left\{ \sigma \in \operatorname{Sh}_{\ell(u),\ell(v)} \ \mid \ u \underset{\sigma}{\sqcup\!\sqcup} z = y \right\} \right| \qquad \text{for every } y \in \mathfrak{A}^L \right).$$

Then, (13.165.5) shows that this family satisfies (13.165.1). All that remains to be proven is now to show that $\eta_{x,x} \neq 0$ (in $\mathbb{N}$).

Indeed, the definition of $\eta_{x,x}$ yields

$$\begin{aligned}
\eta_{x,x} &= \sum_{\substack{z\in\mathfrak{A}^{\ell(v)};\\ z\leq v}} \eta_{v,z} \left|\left\{\sigma\in \operatorname{Sh}_{\ell(u),\ell(v)} \ \mid\ u \underset{\sigma}{\sqcup\!\sqcup} z = x\right\}\right| \\
&= \sum_{\substack{z\in\mathfrak{A}^{\ell(v)};\\ z< v}} \eta_{v,z} \left| \underbrace{\left\{\sigma\in \operatorname{Sh}_{\ell(u),\ell(v)} \ \mid\ u \underset{\sigma}{\sqcup\!\sqcup} z = x\right\}}_{\substack{=\varnothing \\ \text{(since every } \sigma\in\operatorname{Sh}_{\ell(u),\ell(v)} \text{ satisfies } u\underset{\sigma}{\sqcup\!\sqcup} z<x \\ \text{(by (13.165.4)), so that it cannot satisfy } u\underset{\sigma}{\sqcup\!\sqcup} z=x)}} \right| + \eta_{v,v} \left|\left\{\sigma\in \operatorname{Sh}_{\ell(u),\ell(v)} \ \mid\ u \underset{\sigma}{\sqcup\!\sqcup} v = x\right\}\right| \\
&\qquad \text{(here, we have split off the addend for } z=v \text{ from the sum)} \\
&= \sum_{\substack{z\in\mathfrak{A}^{\ell(v)};\\ z< v}} \eta_{v,z} \underbrace{|\varnothing|}_{=0} + \eta_{v,v} \left|\left\{\sigma\in \operatorname{Sh}_{\ell(u),\ell(v)} \ \mid\ u \underset{\sigma}{\sqcup\!\sqcup} v = x\right\}\right| \\
&= \underbrace{\sum_{\substack{z\in\mathfrak{A}^{\ell(v)};\\ z< v}} \eta_{v,z} 0}_{=0} + \eta_{v,v} \left|\left\{\sigma\in \operatorname{Sh}_{\ell(u),\ell(v)} \ \mid\ u \underset{\sigma}{\sqcup\!\sqcup} v = x\right\}\right| \\
&= \underbrace{\eta_{v,v}}_{\neq 0 \text{ (in } \mathbb{N})} \underbrace{\left|\left\{\sigma\in \operatorname{Sh}_{\ell(u),\ell(v)} \ \mid\ u \underset{\sigma}{\sqcup\!\sqcup} v = x\right\}\right|}_{\substack{\neq 0 \text{ (in } \mathbb{N}) \\ \text{(since there exists some } \sigma\in\operatorname{Sh}_{\ell(u),\ell(v)} \text{ satisfying } u\underset{\sigma}{\sqcup\!\sqcup} v=x \\ \text{(because } x=uv\in u\sqcup\!\sqcup v))}} \\
&\neq 0 \text{ (in } \mathbb{N}).
\end{aligned}$$

This completes the proof that there is a family $\left(\eta_{x,y}\right)_{y\in\mathfrak{A}^L} \in \mathbb{N}^{\mathfrak{A}^L}$ of elements of $\mathbb{N}$ satisfying (13.165.1) and $\eta_{x,x} \neq 0$ (in $\mathbb{N}$). The induction step is thus complete, and Proposition 6.3.9 is proven by induction. □

13.166. **Solution to Exercise 6.3.13.** *Solution to Exercise 6.3.13.*

Proof of Theorem 6.3.4. It is clearly enough to prove that $\left(b_w\right)_{w\in\mathfrak{L}}$ is an algebraically independent generating set of the $\mathbf{k}$-algebra $\operatorname{Sh}(V)$.

For every word $u\in\mathfrak{A}^*$, define an element $\mathbf{b}_u$ by $\mathbf{b}_u = b_{a_1} \sqcup\!\sqcup\, b_{a_2} \sqcup\!\sqcup \cdots \sqcup\!\sqcup\, b_{a_p}$, where $(a_1, a_2, \ldots, a_p)$ is the CFL factorization of u. According to Lemma 6.3.7(a) (applied to $A = \operatorname{Sh}(V)$) [1111], the family $\left(b_w\right)_{w\in\mathfrak{L}}$ is an algebraically independent generating set of the $\mathbf{k}$-algebra $\operatorname{Sh}(V)$ if and only if the family $\left(\mathbf{b}_u\right)_{u\in\mathfrak{A}^*}$ is a basis of the $\mathbf{k}$-module $\operatorname{Sh}(V)$. In order to prove the former statement (which is our goal), it is therefore enough to prove the latter statement.

So we must prove the family $\left(\mathbf{b}_u\right)_{u\in\mathfrak{A}^*}$ is a basis of the $\mathbf{k}$-module $\operatorname{Sh}(V)$. We shall first prove a particular case of this statement:

Assertion A: If the set $\mathfrak{A}$ is finite, then the family $\left(\mathbf{b}_u\right)_{u\in\mathfrak{A}^*}$ is a basis of the $\mathbf{k}$-module $\operatorname{Sh}(V)$.

Proof of Assertion A: Assume that the set $\mathfrak{A}$ is finite. Fix $\ell\in\mathbb{N}$. Regard $V^{\otimes \ell}$ as a $\mathbf{k}$-submodule of $T(V)$. Then, $\left(b_{u_1}\otimes b_{u_2}\otimes\cdots\otimes b_{u_\ell}\right)_{u\in\mathfrak{A}^\ell}$ is a basis of the $\mathbf{k}$-module $V^{\otimes\ell}$ (since $\left(b_a\right)_{a\in\mathfrak{A}}$ is a basis of the $\mathbf{k}$-module V). In other words,

$$\left(b_u\right)_{u\in\mathfrak{A}^\ell} \text{ is a basis of the } \mathbf{k}\text{-module } V^{\otimes\ell} \tag{13.166.1}$$

(since $b_u = b_{u_1}b_{u_2}\cdots b_{u_\ell} = b_{u_1}\otimes b_{u_2}\otimes\cdots\otimes b_{u_\ell}$ for every $u\in\mathfrak{A}^\ell$).

[1111] Don't be confused by the fact that the multiplication of the $\mathbf{k}$-algebra $\operatorname{Sh}(V)$ is denoted by $\sqcup\!\sqcup$, but the multiplication of the $\mathbf{k}$-algebra A is denoted by $\cdot$ in Lemma 6.3.7(a).

We know that $\mathbb{Q}$ is a subring of $\mathbf{k}$. Hence, every nonzero element of $\mathbb{N}$ is an invertible element of $\mathbf{k}$.

Now, consider the set $\mathfrak{A}^\ell$ as a poset, whose smaller relation is $\leq$. (This poset is actually totally ordered, though we will not need this.) The notion of an invertibly-triangular $\mathfrak{A}^\ell \times \mathfrak{A}^\ell$-matrix is thus defined (according to Definition 11.1.7(c)).

The set $\mathfrak{A}^\ell$ is finite (since $\mathfrak{A}$ is finite); thus, it is a finite poset.

According to Proposition 6.3.9, the family $(\mathbf{b}_u)_{u\in\mathfrak{A}^\ell}$ expands invertibly triangularly in the basis $(b_u)_{u\in\mathfrak{A}^\ell}$ [1112]. Hence, Corollary 11.1.19(e) (applied to $V^{\otimes \ell}$, $\mathfrak{A}^\ell$, $(\mathbf{b}_u)_{u\in\mathfrak{A}^\ell}$ and $(b_u)_{u\in\mathfrak{A}^\ell}$ instead of M, S, $(e_s)_{s\in S}$ and $(f_s)_{s\in S}$) yields that the family $(\mathbf{b}_u)_{u\in\mathfrak{A}^\ell}$ is a basis of the $\mathbf{k}$-module $V^{\otimes \ell}$ if and only if the family $(b_u)_{u\in\mathfrak{A}^\ell}$ is a basis of the $\mathbf{k}$-module $V^{\otimes \ell}$ [1113]. Hence, the family $(\mathbf{b}_u)_{u\in\mathfrak{A}^\ell}$ is a basis of the $\mathbf{k}$-module $V^{\otimes \ell}$ (since the family $(b_u)_{u\in\mathfrak{A}^\ell}$ is a basis of the $\mathbf{k}$-module $V^{\otimes \ell}$).

Now, let us forget that we fixed ℓ. We thus have shown that, for every $\ell \in \mathbb{N}$, the family $(\mathbf{b}_u)_{u\in\mathfrak{A}^\ell}$ is a basis of the $\mathbf{k}$-module $V^{\otimes \ell}$. Hence, the disjoint union of the families $(\mathbf{b}_u)_{u\in\mathfrak{A}^\ell}$ over all $\ell \in \mathbb{N}$ is a basis of the direct sum $\bigoplus_{\ell\in\mathbb{N}} V^{\otimes \ell}$. Since the former disjoint union is the family $(\mathbf{b}_u)_{u\in\mathfrak{A}^*}$, while the latter direct sum is the $\mathbf{k}$-module $\bigoplus_{\ell\in\mathbb{N}} V^{\otimes \ell} = T(V) = \operatorname{Sh}(V)$, this rewrites as follows: The family $(\mathbf{b}_u)_{u\in\mathfrak{A}^*}$ is a basis of the $\mathbf{k}$-module $\operatorname{Sh}(V)$. This proves Assertion A.

Now, we need to prove that $(\mathbf{b}_u)_{u\in\mathfrak{A}^*}$ is a basis of the $\mathbf{k}$-module $\operatorname{Sh}(V)$, without the assumption that $\mathfrak{A}$ be finite. We will reduce this to Assertion A. First, we need some preparations:

Let $\mathfrak{B}$ be any subset of $\mathfrak{A}$. Then, $\mathfrak{B}$ canonically becomes a totally ordered set (since $\mathfrak{A}$ is totally ordered), so that the notion of a Lyndon word over $\mathfrak{B}$ is well-defined. We view $\mathfrak{B}^*$ as a subset of $\mathfrak{A}^*$, and so the Lyndon words over $\mathfrak{B}$ are precisely the Lyndon words over $\mathfrak{A}$ which lie in $\mathfrak{B}^*$.

We define a $\mathbf{k}$-submodule $V_{\mathfrak{B}}$ of V as the $\mathbf{k}$-linear span of the family $(b_a)_{a\in\mathfrak{B}}$. Notice that the family $(b_a)_{a\in\mathfrak{B}}$ is $\mathbf{k}$-linearly independent (being a subfamily of the basis $(b_a)_{a\in\mathfrak{A}}$ of V), and thus is a basis of the $\mathbf{k}$-submodule $V_{\mathfrak{B}}$.

The inclusion $V_{\mathfrak{B}} \to V$ gives rise to an injective $\mathbf{k}$-algebra homomorphism $\operatorname{Sh}(V_{\mathfrak{B}}) \to \operatorname{Sh}(V)$, which sends every b_w and every $\mathbf{b}_u$ (for $w \in \mathfrak{B}^*$ and $u \in \mathfrak{B}^*$, respectively) to the corresponding elements b_w and $\mathbf{b}_u$ of $\operatorname{Sh}(V)$, respectively. We regard this homomorphism as an inclusion, so that $\operatorname{Sh}(V_{\mathfrak{B}})$ is a $\mathbf{k}$-subalgebra of $\operatorname{Sh}(V)$.

[1112] *Proof.* Proposition 6.3.9 shows that, for every $x \in \mathfrak{A}^\ell$, there exists a family $(\eta_{x,y})_{y\in\mathfrak{A}^\ell} \in \mathbb{N}^{\mathfrak{A}^\ell}$ of elements of $\mathbb{N}$ such that

$$\mathbf{b}_x = \sum_{\substack{y\in\mathfrak{A}^\ell;\\ y\leq x}} \eta_{x,y} b_y \tag{13.166.2}$$

and

$$\eta_{x,x} \neq 0 \qquad \text{(in } \mathbb{N}\text{)}. \tag{13.166.3}$$

Consider such a family $(\eta_{x,y})_{y\in\mathfrak{A}^\ell} \in \mathbb{N}^{\mathfrak{A}^\ell}$ for each $x \in \mathfrak{A}^\ell$. Thus, an integer $\eta_{x,y} \in \mathbb{N} \subset \mathbb{Q} \subset \mathbf{k}$ is defined for each $(x,y) \in \mathfrak{A}^\ell \times \mathfrak{A}^\ell$.

We observe that the only elements $\eta_{s,t}$ (with $(s,t) \in \mathfrak{A}^\ell \times \mathfrak{A}^\ell$) appearing in the statements (13.166.2) and (13.166.3) are those which satisfy $t \leq s$. Hence, if some $(s,t) \in \mathfrak{A}^\ell \times \mathfrak{A}^\ell$ does not satisfy $t \leq s$, then the corresponding element $\eta_{s,t}$ does not appear in any of the statements (13.166.2) and (13.166.3); as a consequence, we can arbitrarily change the value of this $\eta_{s,t}$ without running the risk of invalidating (13.166.2) and (13.166.3). Hence, we can WLOG assume that

$$\text{every } (s,t) \in \mathfrak{A}^\ell \times \mathfrak{A}^\ell \text{ which does not satisfy } t \leq s \text{ must satisfy } \eta_{s,t} = 0 \tag{13.166.4}$$

(otherwise, we can just set all such $\eta_{s,t}$ to 0). Assume this. Thus, the matrix $(\eta_{x,y})_{(x,y)\in\mathfrak{A}^\ell\times\mathfrak{A}^\ell}$ is triangular. The diagonal entries $\eta_{x,x}$ of this matrix are nonzero elements of $\mathbb{N}$ (because of (13.166.3)) and therefore invertible elements of $\mathbf{k}$ (since every nonzero element of $\mathbb{N}$ is an invertible element of $\mathbf{k}$). Thus, the matrix $(\eta_{x,y})_{(x,y)\in\mathfrak{A}^\ell\times\mathfrak{A}^\ell}$ (regarded as a matrix in $\mathbf{k}^{\mathfrak{A}^\ell\times\mathfrak{A}^\ell}$) is invertibly triangular.

Now, every $x \in \mathfrak{A}^\ell$ satisfies

$$\sum_{y\in\mathfrak{A}^\ell} \eta_{x,y} b_y = \underbrace{\sum_{\substack{y\in\mathfrak{A}^\ell;\\ y\leq x}} \eta_{x,y} b_y}_{\substack{=\mathbf{b}_x\\ \text{(by (13.166.2))}}} + \sum_{\substack{y\in\mathfrak{A}^\ell;\\ \text{not } y\leq x}} \underbrace{\eta_{x,y}}_{\substack{=0\\ \text{(by (13.166.4), applied to } (s,t)=(x,y))}} b_y = \mathbf{b}_x + \underbrace{\sum_{\substack{y\in\mathfrak{A}^\ell;\\ \text{not } y\leq x}} 0 b_y}_{=0} = \mathbf{b}_x .$$

In other words, every $x \in \mathfrak{A}^\ell$ satisfies $\mathbf{b}_x = \sum_{y\in\mathfrak{A}^\ell} \eta_{x,y} b_y$. In other words, the family $(\mathbf{b}_u)_{u\in\mathfrak{A}^\ell}$ expands in the family $(b_u)_{u\in\mathfrak{A}^\ell}$ through the matrix $(\eta_{x,y})_{(x,y)\in\mathfrak{A}^\ell\times\mathfrak{A}^\ell}$. Since the latter matrix is invertibly triangular, we thus conclude that the family $(\mathbf{b}_u)_{u\in\mathfrak{A}^\ell}$ expands invertibly triangularly in the family $(b_u)_{u\in\mathfrak{A}^\ell}$.

[1113] Here, we have used the fact that the set $\mathfrak{A}^\ell$ is finite.

If $\mathfrak{B}$ is finite, then Assertion A (applied to $\mathfrak{B}$ instead of $\mathfrak{A}$) yields that the family $(\mathbf{b}_u)_{u\in\mathfrak{B}^*}$ is a basis of the $\mathbf{k}$-module $\operatorname{Sh}(V_{\mathfrak{B}})$.

Now, let us forget that we fixed $\mathfrak{B}$. We thus have shown that for every finite subset $\mathfrak{B}$ of $\mathfrak{A}$,

$$\text{the family } (\mathbf{b}_u)_{u\in\mathfrak{B}^*} \text{ is a basis of the } \mathbf{k}\text{-module } \operatorname{Sh}(V_{\mathfrak{B}}). \tag{13.166.5}$$

Let us introduce one more notation: A family of elements of a $\mathbf{k}$-module is said to be *finitely supported* if all but finitely many elements of this family are 0.

Now, let us show that the family $(\mathbf{b}_u)_{u\in\mathfrak{A}^*}$ is $\mathbf{k}$-linearly independent and spans the $\mathbf{k}$-module $\operatorname{Sh}(V)$.

Proof that the family $(\mathbf{b}_u)_{u\in\mathfrak{A}^*}$ is $\mathbf{k}$-linearly independent: Let $(\lambda_u)_{u\in\mathfrak{A}^*} \in \mathbf{k}^{\mathfrak{A}^*}$ be a finitely supported family of elements of $\mathbf{k}$ satisfying $\sum_{u\in\mathfrak{A}^*}\lambda_u\mathbf{b}_u = 0$. We are going to prove that all $u \in \mathfrak{A}^*$ satisfy $\lambda_u = 0$.

Indeed, the family $(\lambda_u)_{u\in\mathfrak{A}^*}$ is finitely supported, so that there exists a finite subset Z of $\mathfrak{A}^*$ such that all $u \in \mathfrak{A}^* \setminus Z$ satisfy $\lambda_u = 0$. Consider this Z. Since Z is finite, there exists a finite subset $\mathfrak{B}$ of $\mathfrak{A}$ satisfying $Z \subset \mathfrak{B}^*$ (in fact, we can take $\mathfrak{B}$ to be the set of all letters occurring in the words lying in Z). Consider this $\mathfrak{B}$. The family $(\mathbf{b}_u)_{u\in\mathfrak{B}^*}$ is a basis of the $\mathbf{k}$-module $\operatorname{Sh}(V_{\mathfrak{B}})$ (by (13.166.5)), and thus $\mathbf{k}$-linearly independent. We have $\mathfrak{A}^* \setminus \mathfrak{B}^* \subset \mathfrak{A}^* \setminus Z$ (since $Z \subset \mathfrak{B}^*$), and therefore all $u \in \mathfrak{A}^* \setminus \mathfrak{B}^*$ satisfy $\lambda_u = 0$ (since all $u \in \mathfrak{A}^* \setminus Z$ satisfy $\lambda_u = 0$). Hence, $\sum_{u\in\mathfrak{A}^*\setminus\mathfrak{B}^*}\underbrace{\lambda_u}_{=0}\mathbf{b}_u = \sum_{u\in\mathfrak{A}^*\setminus\mathfrak{B}^*}0\mathbf{b}_u = 0$. Now,

$$\begin{aligned} 0 &= \sum_{u\in\mathfrak{A}^*}\lambda_u\mathbf{b}_u = \sum_{u\in\mathfrak{B}^*}\lambda_u\mathbf{b}_u + \underbrace{\sum_{u\in\mathfrak{A}^*\setminus\mathfrak{B}^*}\lambda_u\mathbf{b}_u}_{=0} \qquad (\text{since } \mathfrak{B}^* \text{ is a subset of } \mathfrak{A}^*) \\ &= \sum_{u\in\mathfrak{B}^*}\lambda_u\mathbf{b}_u. \end{aligned}$$

So we have $\sum_{u\in\mathfrak{B}^*}\lambda_u\mathbf{b}_u = 0$. Thus, all $u \in \mathfrak{B}^*$ satisfy $\lambda_u = 0$ (since the family $(\mathbf{b}_u)_{u\in\mathfrak{B}^*}$ is $\mathbf{k}$-linearly independent). Combining this with the fact that all $u \in \mathfrak{A}^* \setminus \mathfrak{B}^*$ satisfy $\lambda_u = 0$, we conclude that all $u \in \mathfrak{A}^*$ satisfy $\lambda_u = 0$.

Now forget that we fixed $(\lambda_u)_{u\in\mathfrak{A}^*}$. We thus have shown that if $(\lambda_u)_{u\in\mathfrak{A}^*} \in \mathbf{k}^{\mathfrak{A}^*}$ is a finitely supported family of elements of $\mathbf{k}$ satisfying $\sum_{u\in\mathfrak{A}^*}\lambda_u\mathbf{b}_u = 0$, then all $u \in \mathfrak{A}^*$ satisfy $\lambda_u = 0$. In other words, the family $(\mathbf{b}_u)_{u\in\mathfrak{A}^*}$ is $\mathbf{k}$-linearly independent.

Proof that the family $(\mathbf{b}_u)_{u\in\mathfrak{A}^*}$ spans the $\mathbf{k}$-module $\operatorname{Sh}(V)$: We are going to show that the family $(\mathbf{b}_u)_{u\in\mathfrak{A}^*}$ spans the $\mathbf{k}$-module $\operatorname{Sh}(V)$. In order to prove this, it is enough to show that b_w lies in the $\mathbf{k}$-linear span of the family $(\mathbf{b}_u)_{u\in\mathfrak{A}^*}$ for every $w \in \mathfrak{A}^*$ (because the family $(b_w)_{w\in\mathfrak{A}^*}$ is a basis of the $\mathbf{k}$-module $\operatorname{Sh}(V)$ [1114]). So let us show this now.

Let $w \in \mathfrak{A}^*$. Then, there exists a finite subset $\mathfrak{B}$ of $\mathfrak{A}$ such that $w \in \mathfrak{B}^*$ (namely, we can take $\mathfrak{B}$ to be the set of all letters of w). Consider this $\mathfrak{B}$. The family $(\mathbf{b}_u)_{u\in\mathfrak{B}^*}$ is a basis of the $\mathbf{k}$-module $\operatorname{Sh}(V_{\mathfrak{B}})$ (by (13.166.5)), and thus spans this $\mathbf{k}$-module. But $b_w \in \operatorname{Sh}(V_{\mathfrak{B}})$ (since $w \in \mathfrak{B}^*$), and thus b_w lies in the $\mathbf{k}$-linear span of the family $(\mathbf{b}_u)_{u\in\mathfrak{B}^*}$ (since this family is a basis of the $\mathbf{k}$-module $\operatorname{Sh}(V_{\mathfrak{B}})$). Hence, b_w lies in the $\mathbf{k}$-linear span of the family $(\mathbf{b}_u)_{u\in\mathfrak{A}^*}$ as well (since this family $(\mathbf{b}_u)_{u\in\mathfrak{A}^*}$ includes the family $(\mathbf{b}_u)_{u\in\mathfrak{B}^*}$ as a subfamily). Thus, we have proven that b_w lies in the $\mathbf{k}$-linear span of the family $(\mathbf{b}_u)_{u\in\mathfrak{A}^*}$ for every $w \in \mathfrak{A}^*$. This completes the proof that the family $(\mathbf{b}_u)_{u\in\mathfrak{A}^*}$ spans the $\mathbf{k}$-module $\operatorname{Sh}(V)$.

Altogether, we now know that the family $(\mathbf{b}_u)_{u\in\mathfrak{A}^*}$ is $\mathbf{k}$-linearly independent and spans the $\mathbf{k}$-module $\operatorname{Sh}(V)$. In other words, $(\mathbf{b}_u)_{u\in\mathfrak{A}^*}$ is a basis of the $\mathbf{k}$-module $\operatorname{Sh}(V)$. This completes our proof of Theorem 6.3.4. □

13.167. **Solution to Exercise 6.4.2.** *Solution to Exercise 6.4.2.* We shall give two solutions to this exercise; but they both rest on the following lemmas:

[1114] *Proof.* For every $\ell \in \mathbb{N}$, the family $(b_u)_{u\in\mathfrak{A}^\ell}$ is a basis of the $\mathbf{k}$-module $V^{\otimes\ell}$ (by (13.166.1)). Hence, the disjoint union of the families $(b_u)_{u\in\mathfrak{A}^\ell}$ over all $\ell \in \mathbb{N}$ is a basis of the direct sum $\bigoplus_{\ell\in\mathbb{N}} V^{\otimes\ell}$. Since the former disjoint union is the family $(b_u)_{u\in\mathfrak{A}^*} = (b_w)_{w\in\mathfrak{A}^*}$, whereas the latter direct sum is the $\mathbf{k}$-module $\bigoplus_{\ell\in\mathbb{N}} V^{\otimes\ell} = T(V) = \operatorname{Sh}(V)$, this rewrites as follows: The family $(b_w)_{w\in\mathfrak{A}^*}$ is a basis of the $\mathbf{k}$-module $\operatorname{Sh}(V)$, qed.

Lemma 13.167.1. *For every positive integer N, we have*

$$\sum_{d\mid N}\mu\left(d\right)=\delta_{N,1}. \tag{13.167.1}$$

Lemma 13.167.1 is one of the most fundamental properties of the number-theoretic Möbius function; it will not be proven here.[1115]

Lemma 13.167.2. *Every positive integer n satisfies*

$$\frac{1}{n}\sum_{d\mid n}\mu\left(d\right)\left(2^{n/d}-1\right)=\frac{1}{n}\sum_{d\mid n}\mu\left(d\right)2^{n/d}-\delta_{n,1}.$$

Proof of Lemma 13.167.2. Let n be a positive integer. Then,

$$\begin{aligned}
&\underbrace{\frac{1}{n}\sum_{d\mid n}\mu\left(d\right)\left(2^{n/d}-1\right)}_{=\sum_{d\mid n}\mu(d)2^{n/d}-\sum_{d\mid n}\mu(d)1}\\
&=\frac{1}{n}\left(\sum_{d\mid n}\mu\left(d\right)2^{n/d}-\sum_{d\mid n}\mu\left(d\right)1\right)=\frac{1}{n}\left(\sum_{d\mid n}\mu\left(d\right)2^{n/d}-\sum_{d\mid n}\mu\left(d\right)\right)\\
&=\frac{1}{n}\sum_{d\mid n}\mu\left(d\right)2^{n/d}-\frac{1}{n}\underbrace{\sum_{d\mid n}\mu\left(d\right)}_{\substack{=\delta_{n,1}\\ \text{(by (13.167.1),}\\ \text{applied to } N=n)}}=\frac{1}{n}\sum_{d\mid n}\mu\left(d\right)2^{n/d}-\underbrace{\frac{1}{n}\delta_{n,1}}_{=\delta_{n,1}}=\frac{1}{n}\sum_{d\mid n}\mu\left(d\right)2^{n/d}-\delta_{n,1}.
\end{aligned}$$

This proves Lemma 13.167.2. □

First solution to Exercise 6.4.2. [The following solution is similar to the solution of Exercise 6.1.29.]

For every positive integer n, let $\operatorname{lync} n$ denote the number of Lyndon compositions of size n. We need to prove that

$$\operatorname{lync} n=\frac{1}{n}\sum_{d\mid n}\mu\left(d\right)\left(2^{n/d}-1\right)=\frac{1}{n}\sum_{d\mid n}\mu\left(d\right)2^{n/d}-\delta_{n,1} \tag{13.167.2}$$

for every positive integer n.

We recall that $\mathfrak{A}^*=\operatorname{Comp}$; that is, the elements of $\mathfrak{A}^*$ are the compositions. Hence, the notation $|w|$ makes sense for any $w\in\mathfrak{A}^*$; it denotes the size of the composition w.

For every $n\in\mathbb{N}$, we have

$$\left|\operatorname{Comp}_n\right|=\begin{cases}2^{n-1}, & \text{if } n\geq 1;\\ 1, & \text{if } n=0\end{cases}$$

[1115] For a proof of Lemma 13.167.1, see the solution of Exercise 2.9.6. (More precisely, Lemma 13.167.1 is obtained from (13.84.3) by renaming n as N.)

[1116]. Thus, for every $n \in \mathbb{N}$, we have

$$\left|\left\{w \in \underbrace{\mathfrak{A}^*}_{=\operatorname{Comp}} \ \mid \ |w| = n\right\}\right| = \left|\underbrace{\{w \in \operatorname{Comp} \ \mid \ |w| = n\}}_{=\operatorname{Comp}_n}\right| = |\operatorname{Comp}_n| \\ = \begin{cases} 2^{n-1}, & \text{if } n \geq 1; \\ 1, & \text{if } n = 0 \end{cases}. \tag{13.167.3}$$

Let $\mathfrak{M}$ denote the set of all finite multisets of Lyndon compositions. Define two maps $\mathbf{m} : \mathfrak{M} \to \mathfrak{A}^*$ and $\mathbf{n} : \mathfrak{A}^* \to \mathfrak{M}$ as in Proposition 13.143.1. Then, Proposition 13.143.1 shows that these two maps $\mathbf{m}$ and $\mathbf{n}$ are mutually inverse bijections (since a Lyndon composition is the same thing as a Lyndon word over the alphabet $\mathfrak{A}$). Hence, the map $\mathbf{m}$ is a bijection.

On the other hand, let $\mathfrak{L}$ be the set of all Lyndon compositions. Thus, the definition of $\mathfrak{M}$ says that $\mathfrak{M}$ is the set of all finite multisets of elements of $\mathfrak{L}$. Also, the definition of $\operatorname{lync} n$ now rewrites as

$$\operatorname{lync} n = |\{w \in \mathfrak{L} \ \mid \ |w| = n\}| \qquad \text{for every positive integer } n. \tag{13.167.4}$$

Let $\mathfrak{N}$ be the set of all families $(k_w)_{w \in \mathfrak{L}} \in \mathbb{N}^{\mathfrak{L}}$ of nonnegative integers (indexed by the Lyndon compositions) such that all but finitely many $w \in \mathfrak{L}$ satisfy $k_w = 0$. Proposition 13.143.2 (applied to $S = \mathfrak{L}$) shows that the map $\operatorname{mult} : \mathfrak{M} \to \mathfrak{N}$ that sends each multiset $M \in \mathfrak{M}$ to the family

$$((\text{multiplicity of } w \text{ in the multiset } M))_{w \in S} \in \mathfrak{N}$$

is well-defined and is a bijection. Consider this map mult.

The composition $\mathbf{m} \circ \operatorname{mult}^{-1} : \mathfrak{N} \to \mathfrak{A}^*$ of the bijections $\mathbf{m}$ and mult^{-1} is clearly a bijection. It can easily be seen to satisfy

$$\left|\left(\mathbf{m} \circ \operatorname{mult}^{-1}\right)\left((k_w)_{w \in \mathfrak{L}}\right)\right| = \sum_{w \in \mathfrak{L}} k_w \cdot |w| \qquad \text{for every } (k_w)_{w \in \mathfrak{L}} \in \mathfrak{N}. \tag{13.167.5}$$

[1116] *Proof.* Let $n \in \mathbb{N}$. Recall that we have a bijection $\operatorname{Comp}_n \to 2^{[n-1]}$, where $[n-1] = \{1, 2, \ldots, n-1\}$. Thus,

$$|\operatorname{Comp}_n| = \left|2^{[n-1]}\right| = 2^{|[n-1]|} = \begin{cases} 2^{n-1}, & \text{if } n \geq 1; \\ 2^0, & \text{if } n = 0 \end{cases} \qquad \left(\text{since } |[n-1]| = \begin{cases} n-1, & \text{if } n \geq 1; \\ 0, & \text{if } n = 0 \end{cases}\right) \\ = \begin{cases} 2^{n-1}, & \text{if } n \geq 1; \\ 1, & \text{if } n = 0 \end{cases},$$

qed.

[1117] Now, in the ring $\mathbb{Q}\left[\left[t\right]\right]$ of formal power series, we have

$$\begin{aligned}\sum_{w\in\mathfrak{A}^*} t^{|w|} &= \sum_{n\in\mathbb{N}} \underbrace{\left|\left\{w\in\mathfrak{A}^* \mid |w|=n\right\}\right|}_{\begin{array}{c}=\begin{cases}2^{n-1}, & \text{if } n\geq 1;\\ 1, & \text{if } n=0\end{cases}\\ \text{(by (13.167.3))}\end{array}} t^n = \sum_{n\in\mathbb{N}} \begin{cases}2^{n-1}, & \text{if } n\geq 1;\\ 1, & \text{if } n=0\end{cases} \cdot t^n \\ &= \underbrace{1t^0}_{=1} + \underbrace{\sum_{\substack{n\in\mathbb{N};\\ n\geq 1}} 2^{n-1}t^n}_{\begin{array}{c}=\sum_{n\in\mathbb{N}} 2^n t^{n+1}\\ \text{(here, we have substituted}\\ n+1 \text{ for } n \text{ in the sum)}\end{array}} = 1 + \sum_{n\in\mathbb{N}} \underbrace{2^n t^{n+1}}_{=(2t)^n t} = 1 + \underbrace{\sum_{n\in\mathbb{N}} \left(2t\right)^n}_{=\dfrac{1}{1-2t}} t = 1 + \frac{1}{1-2t} t = \frac{1-t}{1-2t}.\end{aligned}$$

[1117] *Proof of (13.167.5):* Let $\left(k_w\right)_{w\in\mathfrak{L}} \in \mathfrak{N}$. Let $M = \operatorname{mult}^{-1}\left(\left(k_w\right)_{w\in\mathfrak{L}}\right)$. Then, M is a multiset of elements of $\mathfrak{L}$ and satisfies $\left(k_w\right)_{w\in\mathfrak{L}} = \operatorname{mult} M = \left(\left(\text{multiplicity of } w \text{ in the multiset } M\right)\right)_{w\in\mathfrak{L}}$. In other words, every $w\in\mathfrak{L}$ satisfies

$$k_w = \left(\text{multiplicity of } w \text{ in the multiset } M\right). \tag{13.167.6}$$

Let $a_1, a_2, \ldots, a_k$ denote the elements of this multiset M listed in decreasing order. Then, the definition of $\mathbf{m}$ yields $\mathbf{m}\left(M\right) = a_1a_2\cdots a_k$, so that

$$\begin{aligned}\left|\mathbf{m}\left(M\right)\right| &= \left|a_1a_2\cdots a_k\right| = \sum_{i\in\{1,2,\ldots,k\}} \left|a_i\right| = \sum_{w\in\mathfrak{L}} \sum_{\substack{i\in\{1,2,\ldots,k\};\\ a_i=w}} \left|\underbrace{a_i}_{\substack{=w\\ \text{(since } a_i=w)}}\right| \qquad \text{(since every } a_i \text{ belongs to } \mathfrak{L}\text{)} \\ &= \sum_{w\in\mathfrak{L}} \underbrace{\sum_{\substack{i\in\{1,2,\ldots,k\};\\ a_i=w}} |w|}_{=(\text{number of } i\in\{1,2,\ldots,k\} \text{ satisfying } a_i=w)\cdot|w|} = \sum_{w\in\mathfrak{L}} \underbrace{\left(\text{number of } i\in\{1,2,\ldots,k\} \text{ satisfying } a_i=w\right)}_{\substack{=(\text{multiplicity of } w \text{ in the multiset } M)=k_w\\ \text{(by (13.167.6))}}} \cdot |w| \\ &= \sum_{w\in\mathfrak{L}} k_w \cdot |w|.\end{aligned}$$

Now,

$$\left|\left(\mathbf{m}\circ\operatorname{mult}^{-1}\right)\left(\left(k_w\right)_{w\in\mathfrak{L}}\right)\right| = \left|\mathbf{m}\left(\underbrace{\operatorname{mult}^{-1}\left(\left(k_w\right)_{w\in\mathfrak{L}}\right)}_{=M}\right)\right| = \left|\mathbf{m}\left(M\right)\right| = \sum_{w\in\mathfrak{L}} k_w\cdot|w|,$$

which proves (13.167.5).

Hence,

$$\begin{aligned}
\frac{1-t}{1-2t} &= \sum_{w\in\mathfrak{A}^*} t^{|w|} = \sum_{(k_w)_{w\in\mathfrak{L}}\in\mathfrak{N}} t^{\left|\left(\mathbf{m}\circ\operatorname{mult}^{-1}\right)\left((k_w)_{w\in\mathfrak{L}}\right)\right|} \\
&\qquad \left(\begin{array}{c}\text{here, we substituted } \left(\mathbf{m}\circ\operatorname{mult}^{-1}\right)\left((k_w)_{w\in\mathfrak{L}}\right) \text{ for } w \text{ in the sum,}\\ \text{since the map } \mathbf{m}\circ\operatorname{mult}^{-1} : \mathfrak{N}\to\mathfrak{A}^* \text{ is a bijection}\end{array}\right) \\
&= \sum_{(k_w)_{w\in\mathfrak{L}}\in\mathfrak{N}} t^{\sum_{w\in\mathfrak{L}} k_w\cdot|w|} \qquad \text{(by (13.167.5))} \\
&= \sum_{(k_w)_{w\in\mathfrak{L}}\in\mathfrak{N}} \prod_{w\in\mathfrak{L}} t^{k_w\cdot|w|} = \prod_{w\in\mathfrak{L}} \underbrace{\sum_{k\in\mathbb{N}} t^{k\cdot|w|}}_{=\frac{1}{1-t^{|w|}}} \qquad \text{(by the product rule)} \\
&= \prod_{w\in\mathfrak{L}} \frac{1}{1-t^{|w|}} = \prod_{n\geq 1} \prod_{\substack{w\in\mathfrak{L};\\ |w|=n}} \underbrace{\frac{1}{1-t^{|w|}}}_{\substack{=\frac{1}{1-t^n}\\ \text{(since } |w|=n)}} \qquad \text{(since } |w|\geq 1 \text{ for every } w\in\mathfrak{L}) \\
&= \prod_{n\geq 1} \underbrace{\prod_{\substack{w\in\mathfrak{L};\\ |w|=n}} \frac{1}{1-t^n}}_{\substack{=\left(\frac{1}{1-t^n}\right)^{\operatorname{lync} n}\\ \text{(by (13.167.4))}}} = \prod_{n\geq 1} \left(\frac{1}{1-t^n}\right)^{\operatorname{lync} n}.
\end{aligned}$$

Taking the logarithm of both sides of this identity, we obtain

$$\begin{aligned}
\log\frac{1-t}{1-2t} &= \log\left(\prod_{n\geq 1}\left(\frac{1}{1-t^n}\right)^{\operatorname{lync} n}\right) = \sum_{n\geq 1} (\operatorname{lync} n)\cdot \underbrace{\log\left(\frac{1}{1-t^n}\right)}_{\substack{=-\log(1-t^n)=\sum_{u\geq 1}\frac{1}{u}(t^n)^u\\ \text{(by the Mercator series for the logarithm)}}} \\
&= \sum_{n\geq 1} (\operatorname{lync} n)\cdot \sum_{u\geq 1}\frac{1}{u}(t^n)^u = \sum_{n\geq 1}\sum_{u\geq 1} (\operatorname{lync} n)\frac{1}{u}\underbrace{(t^n)^u}_{=t^{nu}} = \sum_{n\geq 1}\sum_{u\geq 1} (\operatorname{lync} n)\frac{1}{u}t^{nu} \\
&= \underbrace{\sum_{n\geq 1}\sum_{\substack{v\geq 1;\\ n\mid v}}}_{=\sum_{v\geq 1}\sum_{n\mid v}} (\operatorname{lync} n)\underbrace{\frac{1}{v/n}}_{=\frac{n}{v}} t^v \qquad \text{(here, we substituted } v/n \text{ for } u \text{ in the second sum)} \\
&= \sum_{v\geq 1}\sum_{n\mid v} (\operatorname{lync} n)\frac{n}{v}t^v = \sum_{n\geq 1}\sum_{d\mid n} (\operatorname{lync} d)\frac{d}{n}t^n
\end{aligned}$$

(here, we renamed the summation indices v and n as n and d). Since

$$\begin{aligned}\log\frac{1-t}{1-2t} &= \log(1-t) - \log(1-2t) \\ &= \underbrace{(-\log(1-2t))}_{\substack{=\sum_{n\geq 1}\frac{1}{n}(2t)^n \\ \text{(by the Mercator series for the logarithm)}}} - \underbrace{(-\log(1-t))}_{\substack{=\sum_{n\geq 1}\frac{1}{n}t^n \\ \text{(by the Mercator series for the logarithm)}}} \\ &= \sum_{n\geq 1}\frac{1}{n}(2t)^n - \sum_{n\geq 1}\frac{1}{n}t^n = \sum_{n\geq 1}\frac{1}{n}\underbrace{\left((2t)^n - t^n\right)}_{=(2^n-1)t^n} = \sum_{n\geq 1}\frac{1}{n}(2^n-1)t^n,\end{aligned}$$

this rewrites as

$$\sum_{n\geq 1}\frac{1}{n}(2^n-1)t^n = \sum_{n\geq 1}\sum_{d\mid n}(\operatorname{lync} d)\frac{d}{n}t^n.$$

Comparing coefficients, we conclude that every positive integer n satisfies

$$\frac{1}{n}(2^n-1) = \sum_{d\mid n}(\operatorname{lync} d)\frac{d}{n}.$$

Multiplying this with n, we obtain

$$2^n - 1 = \sum_{d\mid n}(\operatorname{lync} d)\, d. \tag{13.167.7}$$

Now, every positive integer n satisfies

$$\begin{aligned}\sum_{d\mid n}\mu(d)\left(2^{n/d}-1\right) &= \sum_{e\mid n}\mu(e)\underbrace{\left(2^{n/e}-1\right)}_{\substack{=\sum_{d\mid n/e}(\operatorname{lync} d)d \\ \text{(by (13.167.7), applied} \\ \text{to } n/e \text{ instead of } n)}} = \sum_{e\mid n}\mu(e)\sum_{d\mid n/e}(\operatorname{lync} d)\, d \\ &= \underbrace{\sum_{e\mid n}\sum_{d\mid n/e}}_{=\sum_{d\mid n}\sum_{e\mid n/d}}\mu(e)(\operatorname{lync} d)\, d = \sum_{d\mid n}\underbrace{\sum_{e\mid n/d}\mu(e)}_{\substack{=\delta_{n/d,1} \\ \text{(by (13.167.1), applied} \\ \text{to } N=n/d)}}(\operatorname{lync} d)\, d \\ &= \sum_{d\mid n}\underbrace{\delta_{n/d,1}}_{=\delta_{n,d}}(\operatorname{lync} d)\, d = \sum_{d\mid n}\delta_{n,d}(\operatorname{lync} d)\, d = (\operatorname{lync} n)\, n.\end{aligned}$$

Dividing this by n, we obtain $\frac{1}{n}\sum_{d\mid n}\mu(d)\left(2^{n/d}-1\right) = \operatorname{lync} n$. Hence,

$$\operatorname{lync} n = \frac{1}{n}\sum_{d\mid n}\mu(d)\left(2^{n/d}-1\right) = \frac{1}{n}\sum_{d\mid n}\mu(d)\, 2^{n/d} - \delta_{n,1}$$

(by Lemma 13.167.2). This proves (13.167.2). Thus, Exercise 6.4.2 is solved.

Second solution to Exercise 6.4.2. Let $\mathfrak{B}$ denote the two-element set $\{\mathbf{0},\mathbf{1}\}$, where $\mathbf{0}$ and $\mathbf{1}$ are two new objects. We make $\mathfrak{B}$ into a totally ordered set by setting $\mathbf{0}<\mathbf{1}$. In the following, we will study not only words over the alphabet $\mathfrak{A}=\{1,2,3,\ldots\}$, but also words over the alphabet $\mathfrak{B}$. The latter words form the set $\mathfrak{B}^*$. Let $\mathfrak{L}_{\mathfrak{B}}$ denote the set of all Lyndon words over the alphabet $\mathfrak{B}$.

For every $k \in \mathfrak{A}$, define an element $\widetilde{k}$ of $\mathfrak{B}^*$ by $\widetilde{k} = \left(\mathbf{0}, \underbrace{\mathbf{1}, \mathbf{1}, \ldots, \mathbf{1}}_{k-1 \text{ times}}\right)$. (This is well-defined, since $\mathfrak{A} = \{1, 2, 3, \ldots\}$.) We can rewrite the definition of $\widetilde{k}$ as follows: We have[1118]

$$\widetilde{k} = \mathbf{01}^{k-1} \qquad \text{for every positive integer } k \tag{13.167.8}$$

(where "$\mathbf{0}$" and "$\mathbf{1}$" are regarded as one-letter words). Thus,

$$\ell\left(\widetilde{k}\right) = k \qquad \text{for every positive integer } k \tag{13.167.9}$$

[1119]. Also,

$$\widetilde{k+1} = \widetilde{k}\mathbf{1} \qquad \text{for every positive integer } k \tag{13.167.10}$$

(where "$\widetilde{k}\mathbf{1}$" means the concatenation of $\widetilde{k}$ with the one-letter word $\mathbf{1}$). [1120] As a consequence, $\widetilde{k}$ is a prefix of $\widetilde{k+1}$ for every positive integer k. Thus, $\widetilde{k} < \widetilde{k+1}$ (in the lexicographic order on $\mathfrak{B}^*$) for every positive integer k [1121]. In other words,

$$\widetilde{1} < \widetilde{2} < \widetilde{3} < \cdots \qquad \text{in the lexicographic order on } \mathfrak{B}^*.$$

We notice a slightly stronger property: For any $a \in \mathfrak{A}$ and $b \in \mathfrak{A}$ satisfying $a < b$, we have

$$\widetilde{a}\left(\widetilde{c_1}\widetilde{c_2}\cdots\widetilde{c_s}\right) < \widetilde{b}w \tag{13.167.11}$$

for any $s \in \mathbb{N}$, any $c_1, c_2, \ldots, c_s \in \mathfrak{A}$ and any $w \in \mathfrak{B}^*$. [1122]

[1118] Here and in the following, expressions like $\mathbf{01}^n$ (for $n \in \mathbb{N}$) have to be understood as $\mathbf{0}\left(\mathbf{1}^n\right)$ rather than as $\left(\mathbf{01}\right)^n$. (The objects $\mathbf{0}$ and $\mathbf{1}$ are not actually numbers; they don't form digital expansions.)

[1119] *Proof.* Let k be a positive integer. Then, (13.167.8) yields $\widetilde{k} = \mathbf{01}^{k-1}$. Now,

$$\ell\left(\underbrace{\widetilde{k}}_{=\mathbf{01}^{k-1}}\right) = \ell\left(\mathbf{01}^{k-1}\right) = \underbrace{\ell\left(\mathbf{0}\right)}_{=1} + \underbrace{\ell\left(\mathbf{1}^{k-1}\right)}_{=(k-1)\ell(\mathbf{1})} = 1 + (k-1)\underbrace{\ell\left(\mathbf{1}\right)}_{=1} = 1 + (k-1) = k,$$

qed.

[1120] *Proof.* Let k be a positive integer. Then, $k \geq 1$, so that $k - 1 \geq 0$. But (13.167.8) (applied to $k+1$ instead of k) yields

$$\widetilde{k+1} = \mathbf{0} \underbrace{\mathbf{1}^{(k+1)-1}}_{\substack{=\mathbf{1}^k = \mathbf{1}^{(k-1)+1} = \mathbf{1}^{k-1}\mathbf{1} \\ (\text{since } k-1 \geq 0)}} = \underbrace{\mathbf{01}^{k-1}}_{\substack{=\widetilde{k} \\ (\text{by } (13.167.8))}} \mathbf{1} = \widetilde{k}\mathbf{1},$$

qed.

[1121] *Proof.* Let k be a positive integer. Then, $\widetilde{k} \leq \widetilde{k+1}$ (since $\widetilde{k}$ is a prefix of $\widetilde{k+1}$). Also, (13.167.9) (applied to $k+1$ instead of k) yields $\ell\left(\widetilde{k+1}\right) = k+1$. Now, (13.167.9) yields $\ell\left(\widetilde{k}\right) = k < k+1 = \ell\left(\widetilde{k+1}\right)$, so that $\ell\left(\widetilde{k}\right) \neq \ell\left(\widetilde{k+1}\right)$ and thus $\widetilde{k} \neq \widetilde{k+1}$. Combined with $\widetilde{k} \leq \widetilde{k+1}$, this yields $\widetilde{k} < \widetilde{k+1}$, qed.

[1122] *Proof of (13.167.11):* Let $a \in \mathfrak{A}$ and $b \in \mathfrak{A}$ be such that $a < b$. Let $s \in \mathbb{N}$, let $c_1, c_2, \ldots, c_s \in \mathfrak{A}$ and let $w \in \mathfrak{B}^*$. We need to prove that (13.167.11) holds.

Assume the contrary. Thus, $\widetilde{a}\left(\widetilde{c_1}\widetilde{c_2}\cdots\widetilde{c_s}\right) < \widetilde{b}w$ does not hold. We thus have $\widetilde{a}\left(\widetilde{c_1}\widetilde{c_2}\cdots\widetilde{c_s}\right) \geq \widetilde{b}w$. Hence, $\widetilde{a}\left(\widetilde{c_1}\widetilde{c_2}\cdots\widetilde{c_s}\right) \geq \widetilde{b}w \geq \widetilde{b}$.

We notice that $b - a > 0$ (since $a < b$), so that the word $\mathbf{1}^{b-a}$ is nonempty. Also, $b - a > 0$, so that $b - a \geq 1$ (since $b - a$ is an integer) and thus $(b-a) - 1 \geq 0$. Hence, the word $\mathbf{1}^{(b-a)-1}$ is well-defined, and we have $\mathbf{1}^{b-a} = \mathbf{11}^{(b-a)-1}$.

Applying (13.167.8) to $k = a$, we obtain $\widetilde{a} = \mathbf{01}^{a-1}$. But $b - 1 = (a-1) + (b-a)$, so that $\mathbf{1}^{b-1} = \mathbf{1}^{(a-1)+(b-a)} = \mathbf{1}^{a-1}\mathbf{1}^{b-a}$ (since $b - a > 0$). Now, (13.167.8) (applied to $k = b$) yields

$$\widetilde{b} = \mathbf{0} \underbrace{\mathbf{1}^{b-1}}_{=\mathbf{1}^{a-1}\mathbf{1}^{b-a}} = \underbrace{\mathbf{01}^{a-1}}_{=\widetilde{a}} \mathbf{1}^{b-a} = \widetilde{a}\mathbf{1}^{b-a} > \widetilde{a}$$

(since $\mathbf{1}^{b-a}$ is a nonempty word). Hence, $\widetilde{a} < \widetilde{b}$. Now, if we had $s = 0$, then we would have $\widetilde{a} \underbrace{\left(\widetilde{c_1}\widetilde{c_2}\cdots\widetilde{c_s}\right)}_{=(\text{empty product})=\varnothing} = \widetilde{a} < \widetilde{b}$, which would contradict $\widetilde{a}\left(\widetilde{c_1}\widetilde{c_2}\cdots\widetilde{c_s}\right) \geq \widetilde{b}$. Hence, we cannot have $s = 0$. We thus have $s \geq 1$. Consequently, c_1 is well-defined. From (13.167.8) (applied to $k = c_1$), we have $\widetilde{c_1} = \mathbf{01}^{c_1 - 1}$. Thus, $\mathbf{0}$ is a prefix of $\widetilde{c_1}$. Since $\widetilde{c_1}$ is, in turn, a prefix of $\widetilde{c_1}\widetilde{c_2}\cdots\widetilde{c_s}$, this yields that $\mathbf{0}$ is a prefix of $\widetilde{c_1}\widetilde{c_2}\cdots\widetilde{c_s}$. In other words, there exists a $t \in \mathfrak{B}^*$ such that $\widetilde{c_1}\widetilde{c_2}\cdots\widetilde{c_s} = \mathbf{0}t$. Consider this t. Now,

$$\widetilde{a} \underbrace{\mathbf{0}t}_{=\widetilde{c_1}\widetilde{c_2}\cdots\widetilde{c_s}} = \widetilde{a}\left(\widetilde{c_1}\widetilde{c_2}\cdots\widetilde{c_s}\right) \geq \widetilde{b} = \widetilde{a}\mathbf{1}^{b-a}.$$

Also,

$$\widetilde{k} \text{ is a Lyndon word over the alphabet } \mathfrak{B} \text{ for every positive integer } k. \tag{13.167.12}$$

[1123]

We can now define a map $\Phi : \mathfrak{A}^* \to \mathfrak{B}^*$ by setting

$$\left(\Phi\left((w_1, w_2, \ldots, w_k) \right) = \widetilde{w_1}\widetilde{w_2}\cdots\widetilde{w_k} \qquad \text{for every word } (w_1, w_2, \ldots, w_k) \in \mathfrak{A}^* \right).$$

In other words, $\widetilde{a}\mathbf{1}^{b-a} \leq \widetilde{a}\mathbf{0}t$. Thus, Proposition 6.1.2(c) (applied to $\mathfrak{B}$, $\widetilde{a}$, $\mathbf{1}^{b-a}$ and $\mathbf{0}t$ instead of $\mathfrak{A}$, a, c and d) yields $\mathbf{1}^{b-a} \leq \mathbf{0}t$. Now, $\mathbf{1}\mathbf{1}^{(b-a)-1} = \mathbf{1}^{b-a} \leq \mathbf{0}t$. Therefore, Proposition 6.1.2(e) (applied to $\mathfrak{B}$, $\mathbf{1}$, $\mathbf{1}^{(b-a)-1}$, $\mathbf{0}$ and t instead of $\mathfrak{A}$, a, b, c and d) yields that either we have $\mathbf{1} \leq \mathbf{0}$ or the word $\mathbf{0}$ is a prefix of $\mathbf{1}$. Since the word $\mathbf{0}$ is not a prefix of $\mathbf{1}$, this shows that $\mathbf{1} \leq \mathbf{0}$. But this contradicts $\mathbf{0} < \mathbf{1}$. This contradiction proves that our assumption was wrong, qed.

[1123] *Proof.* Let k be a positive integer. From (13.167.8), we obtain $\widetilde{k} = \mathbf{0}\mathbf{1}^{k-1}$.

From (13.167.9), we have $\ell\left(\widetilde{k}\right) = k \geq 1$. Thus, the word $\widetilde{k}$ is nonempty.

Let v be a nonempty proper suffix of $\widetilde{k}$. We will show that $v > \widetilde{k}$.

Indeed, there exists a nonempty $u \in \mathfrak{B}^*$ satisfying $\widetilde{k} = uv$ (since v is a proper suffix of $\widetilde{k}$). Consider this u. Since u is nonempty, the first letter of u is well-defined. We have

$$\begin{aligned}(\text{the first letter of } u) &= \left(\text{the first letter of } \underbrace{\widetilde{k}}_{=\mathbf{0}\mathbf{1}^{k-1}}\right) \qquad \left(\text{since } u \text{ is a prefix of } \widetilde{k} \text{ (since } \widetilde{k} = uv)\right) \\ &= \left(\text{the first letter of } \mathbf{0}\mathbf{1}^{k-1}\right) = \mathbf{0}.\end{aligned}$$

Thus, $\mathbf{0}$ is a prefix of u. In other words, there exists a word $u' \in \mathfrak{B}^*$ satisfying $u = \mathbf{0}u'$. Consider this u'. We have $\underbrace{\mathbf{0}u'}_{=u} v = uv = \widetilde{k} = \mathbf{0}\mathbf{1}^{k-1}$. Cancelling $\mathbf{0}$ from this equality, we obtain $u'v = \mathbf{1}^{k-1}$. Hence, v is a suffix of the word $\mathbf{1}^{k-1}$. Thus, v has the form $\mathbf{1}^p$ for some $p \in \mathbb{N}$ (since every suffix of the word $\mathbf{1}^{k-1}$ has this form). Consider this p. The word v is nonempty; thus, $v \neq \varnothing$. We have $p \neq 0$ (since otherwise, we would have

$$\begin{aligned} v = \mathbf{1}^p &= \mathbf{1}^0 \qquad (\text{since } p = 0) \\ &= \varnothing, \end{aligned}$$

contradicting $v \neq \varnothing$). Hence, $p \geq 1$, so that $p - 1 \geq 0$ and thus $\mathbf{1}^p = \mathbf{1}\mathbf{1}^{p-1}$. Now, $\mathbf{0} < \mathbf{1}$. Hence, Proposition 6.1.2(d) (applied to $\mathfrak{B}$, $\mathbf{0}$, $\mathbf{1}^{k-1}$, $\mathbf{1}$ and $\mathbf{1}^{p-1}$ instead of $\mathfrak{A}$, a, b, c and d) yields that either we have $\mathbf{0}\mathbf{1}^{k-1} \leq \mathbf{1}\mathbf{1}^{p-1}$ or the word $\mathbf{0}$ is a prefix of $\mathbf{1}$. Since the word $\mathbf{0}$ is not a prefix of $\mathbf{1}$, we thus obtain $\mathbf{0}\mathbf{1}^{k-1} \leq \mathbf{1}\mathbf{1}^{p-1}$, so that $\widetilde{k} = \mathbf{0}\mathbf{1}^{k-1} \leq \mathbf{1}\mathbf{1}^{p-1} = \mathbf{1}^p = v$. Hence, $v \geq \widetilde{k}$. Since $v \neq \widetilde{k}$ (because v is a **proper** suffix of $\widetilde{k}$), this yields $v > \widetilde{k}$.

Now, let us forget that we fixed v. We thus have proven that every nonempty proper suffix v of $\widetilde{k}$ satisfies $v > \widetilde{k}$. Since the word $\widetilde{k}$ is nonempty, this shows that the word $\widetilde{k}$ is Lyndon (by the definition of a Lyndon word), qed.

This map Φ is clearly a monoid homomorphism[1124]. Hence, $\Phi(\varnothing) = \varnothing$. Also, the map Φ is strictly order-preserving (with respect to the lexicographical orders on $\mathfrak{A}^*$ and $\mathfrak{B}^*$) [1125]. Consequently, the map Φ is injective[1126].

[1124] Indeed, we could just as well have defined Φ as the unique monoid homomorphism $\mathfrak{A}^* \to \mathfrak{B}^*$ which sends every $k \in \mathfrak{A}$ to $\widetilde{k} \in \mathfrak{B}^*$. This definition makes sense since $\mathfrak{A}^*$ is the free monoid on $\mathfrak{A}$.

[1125] *Proof.* Let u and v be two words in $\mathfrak{A}^*$ satisfying $u < v$. We are going to prove that $\Phi(u) < \Phi(v)$ in $\mathfrak{B}^*$.

We have $u < v$. Thus, $u \leq v$. By the definition of the relation $\leq$, this means that

$$\begin{aligned}
&\textbf{either } \text{there exists an } i \in \{1,2,\ldots,\min\{\ell(u),\ell(v)\}\} \\
&\qquad \text{such that } (u_i < v_i, \text{ and every } j \in \{1,2,\ldots,i-1\} \text{ satisfies } u_j = v_j), \\
&\textbf{or } \text{the word } u \text{ is a prefix of } v.
\end{aligned}$$

We thus must be in one of the following two cases:

Case 1: There exists an $i \in \{1,2,\ldots,\min\{\ell(u),\ell(v)\}\}$ such that ($u_i < v_i$, and every $j \in \{1,2,\ldots,i-1\}$ satisfies $u_j = v_j$).

Case 2: The word u is a prefix of v.

Let us first consider Case 1. In this case, there exists an $i \in \{1,2,\ldots,\min\{\ell(u),\ell(v)\}\}$ such that ($u_i < v_i$, and every $j \in \{1,2,\ldots,i-1\}$ satisfies $u_j = v_j$). Consider this i. We have $\widetilde{a} < \widetilde{b}$ for any two elements a and b of $\mathfrak{A}$ satisfying $a < b$ (because $\widetilde{1} < \widetilde{2} < \widetilde{3} < \cdots$). Applying this to $a = u_i$ and $b = v_i$, we obtain $\widetilde{u_i} < \widetilde{v_i}$.

But let $g = \widetilde{u_1}\widetilde{u_2}\cdots\widetilde{u_{i-1}}$. Every $j \in \{1,2,\ldots,i-1\}$ satisfies $u_j = v_j$. Thus, every $j \in \{1,2,\ldots,i-1\}$ satisfies $\widetilde{u_j} = \widetilde{v_j}$. Taking the product of these equalities over all $j \in \{1,2,\ldots,i-1\}$, we obtain $\widetilde{u_1}\widetilde{u_2}\cdots\widetilde{u_{i-1}} = \widetilde{v_1}\widetilde{v_2}\cdots\widetilde{v_{i-1}}$, so that $g = \widetilde{u_1}\widetilde{u_2}\cdots\widetilde{u_{i-1}} = \widetilde{v_1}\widetilde{v_2}\cdots\widetilde{v_{i-1}}$.

We have $u_i < v_i$. Thus, $\widetilde{u_i}\left(\widetilde{u_{i+1}}\widetilde{u_{i+2}}\cdots\widetilde{u_{\ell(u)}}\right) < \widetilde{v_i}\left(\widetilde{v_{i+1}}\widetilde{v_{i+2}}\cdots\widetilde{v_{\ell(v)}}\right)$ (by (13.167.11), applied to $a = u_i$, $b = v_i$, $s = \ell(u) - i$, $c_k = u_{i+k}$ and $w = \widetilde{v_{i+1}}\widetilde{v_{i+2}}\cdots\widetilde{v_{\ell(v)}}$). Thus,

$$\widetilde{u_i}\widetilde{u_{i+1}}\cdots\widetilde{u_{\ell(u)}} = \widetilde{u_i}\left(\widetilde{u_{i+1}}\widetilde{u_{i+2}}\cdots\widetilde{u_{\ell(u)}}\right) < \widetilde{v_i}\left(\widetilde{v_{i+1}}\widetilde{v_{i+1}}\cdots\widetilde{v_{\ell(v)}}\right) = \widetilde{v_i}\widetilde{v_{i+1}}\cdots\widetilde{v_{\ell(v)}}.$$

Hence, Proposition 6.1.2(b) (applied to $\mathfrak{B}$, g, $\widetilde{u_i}\widetilde{u_{i+1}}\cdots\widetilde{u_{\ell(u)}}$ and $\widetilde{v_i}\widetilde{v_{i+1}}\cdots\widetilde{v_{\ell(v)}}$ instead of $\mathfrak{A}$, a, c and d) yields

$$g\left(\widetilde{u_i}\widetilde{u_{i+1}}\cdots\widetilde{u_{\ell(u)}}\right) \leq g\left(\widetilde{v_i}\widetilde{v_{i+1}}\cdots\widetilde{v_{\ell(v)}}\right).$$

Moreover, $g\left(\widetilde{u_i}\widetilde{u_{i+1}}\cdots\widetilde{u_{\ell(u)}}\right) \neq g\left(\widetilde{v_i}\widetilde{v_{i+1}}\cdots\widetilde{v_{\ell(v)}}\right)$ (because otherwise, we would have $g\left(\widetilde{u_i}\widetilde{u_{i+1}}\cdots\widetilde{u_{\ell(u)}}\right) = g\left(\widetilde{v_i}\widetilde{v_{i+1}}\cdots\widetilde{v_{\ell(v)}}\right)$, and thus (by cancelling g from the equality $g\left(\widetilde{u_i}\widetilde{u_{i+1}}\cdots\widetilde{u_{\ell(u)}}\right) = g\left(\widetilde{v_i}\widetilde{v_{i+1}}\cdots\widetilde{v_{\ell(v)}}\right)$) we would obtain $\widetilde{u_i}\widetilde{u_{i+1}}\cdots\widetilde{u_{\ell(u)}} = \widetilde{v_i}\widetilde{v_{i+1}}\cdots\widetilde{v_{\ell(v)}}$, which would contradict $\widetilde{u_i}\widetilde{u_{i+1}}\cdots\widetilde{u_{\ell(u)}} < \widetilde{v_i}\widetilde{v_{i+1}}\cdots\widetilde{v_{\ell(v)}}$). Combining this with $g\left(\widetilde{u_i}\widetilde{u_{i+1}}\cdots\widetilde{u_{\ell(u)}}\right) \leq g\left(\widetilde{v_i}\widetilde{v_{i+1}}\cdots\widetilde{v_{\ell(v)}}\right)$, we obtain $g\left(\widetilde{u_i}\widetilde{u_{i+1}}\cdots\widetilde{u_{\ell(u)}}\right) < g\left(\widetilde{v_i}\widetilde{v_{i+1}}\cdots\widetilde{v_{\ell(v)}}\right)$.

But $u = \left(u_1, u_2, \ldots, u_{\ell(u)}\right)$, so that

$$\begin{aligned}
\Phi(u) &= \Phi\left(\left(u_1, u_2, \ldots, u_{\ell(u)}\right)\right) \qquad \text{(by the definition of } \Phi(u)) \\
&= \widetilde{u_1}\widetilde{u_2}\cdots\widetilde{u_{\ell(u)}} = \underbrace{\left(\widetilde{u_1}\widetilde{u_2}\cdots\widetilde{u_{i-1}}\right)}_{=g}\left(\widetilde{u_i}\widetilde{u_{i+1}}\cdots\widetilde{u_{\ell(u)}}\right) = g\left(\widetilde{u_i}\widetilde{u_{i+1}}\cdots\widetilde{u_{\ell(u)}}\right) \\
&< \underbrace{g}_{=\widetilde{v_1}\widetilde{v_2}\cdots\widetilde{v_{i-1}}}\left(\widetilde{v_i}\widetilde{v_{i+1}}\cdots\widetilde{v_{\ell(v)}}\right) = \left(\widetilde{v_1}\widetilde{v_2}\cdots\widetilde{v_{i-1}}\right)\left(\widetilde{v_i}\widetilde{v_{i+1}}\cdots\widetilde{v_{\ell(v)}}\right) = \widetilde{v_1}\widetilde{v_2}\cdots\widetilde{v_{\ell(v)}} = \Phi(v)
\end{aligned}$$

(since $\Phi(v) = \widetilde{v_1}\widetilde{v_2}\cdots\widetilde{v_{\ell(v)}}$ (by the definition of $\Phi(v)$)). Thus, $\Phi(u) < \Phi(v)$ is proven in Case 1.

Let us now consider Case 2. In this case, the word u is a prefix of v. That is, there exists a word $r \in \mathfrak{A}^*$ such that $v = ur$. Consider this r. We have $\Phi\left(\underbrace{v}_{=ur}\right) = \Phi(ur) = \Phi(u)\Phi(r)$ (since Φ is a monoid homomorphism). If we had $r = \varnothing$, then we would have $v = u\underbrace{r}_{=\varnothing} = u < v$, which is absurd. Hence, we cannot have $r = \varnothing$. In other words, r is nonempty, so that $\ell(r) \geq 1$.

Now, let us check that $\Phi(r)$ is nonempty. In fact, $r = \left(r_1, r_2, \ldots, r_{\ell(r)}\right)$, so that $\Phi(r) = \widetilde{r_1}\widetilde{r_2}\cdots\widetilde{r_{\ell(r)}}$ (by the definition of $\Phi(r)$). Notice that r_1 is well-defined, since $\ell(r) \geq 1$. From (13.167.8) (applied to $k = r_1$), we obtain $\widetilde{r_1} = \mathbf{0}\mathbf{1}^{r_1 - 1}$, so that $\mathbf{0}$ is a prefix of the word $\widetilde{r_1}$. Since $\widetilde{r_1}$ (in turn) is a prefix of the word $\widetilde{r_1}\widetilde{r_2}\cdots\widetilde{r_{\ell(r)}}$, this yields that $\mathbf{0}$ is a prefix of the word $\widetilde{r_1}\widetilde{r_2}\cdots\widetilde{r_{\ell(r)}}$. In other words, $\mathbf{0}$ is a prefix of the word $\Phi(r)$ (since $\Phi(r) = \widetilde{r_1}\widetilde{r_2}\cdots\widetilde{r_{\ell(r)}}$). Hence, the word $\Phi(r)$ has a nonempty prefix (namely, $\mathbf{0}$). Thus, the word $\Phi(r)$ is nonempty. In other words, $\Phi(r) \neq \varnothing$. That is, $\varnothing \neq \Phi(r)$.

Since $\Phi(v) = \Phi(u)\Phi(r)$, we now see that the word $\Phi(u)$ is a prefix of $\Phi(v)$ (since $\Phi(r)$ is nonempty). Hence, $\Phi(u) \leq \Phi(v)$. On the other hand, if we had $\Phi(u) = \Phi(v)$, then we would have $\Phi(u)\varnothing = \Phi(u) = \Phi(v) = \Phi(u)\Phi(r)$, and therefore we would have $\varnothing = \Phi(r)$ (as a result of cancelling $\Phi(u)$ from the equality $\Phi(u)\varnothing = \Phi(u)\Phi(r)$), which would contradict $\varnothing \neq \Phi(r)$. Hence, we cannot have $\Phi(u) = \Phi(v)$. We therefore must have $\Phi(u) \neq \Phi(v)$. Hence, $\Phi(u) \leq \Phi(v)$ becomes $\Phi(u) < \Phi(v)$. We thus have proven $\Phi(u) < \Phi(v)$ in Case 2.

Now, we have proven that $\Phi(u) < \Phi(v)$ in each of the two Cases 1 and 2. Since these two Cases cover all possibilities, this shows that $\Phi(u) < \Phi(v)$ always holds.

For every $w \in \mathfrak{B}^*$, we denote by $w\mathfrak{B}^*$ the set $\{wu \mid u \in \mathfrak{B}^*\}$ (that is, the set of all words in $\mathfrak{B}^*$ which have w as a prefix). Every nonempty word in $\mathfrak{B}^*$ starts with either the letter $\mathbf{0}$ or the letter $\mathbf{1}$, but not both. In other words, every nonempty word in $\mathfrak{B}^*$ belongs to either $\mathbf{0}\mathfrak{B}^*$ or $\mathbf{1}\mathfrak{B}^*$ (where $\mathbf{0}$ and $\mathbf{1}$ are regarded as one-letter words), but not both. In other words, $\mathfrak{B}^* \setminus \{\varnothing\} = \mathbf{0}\mathfrak{B}^* \cup \mathbf{1}\mathfrak{B}^*$ and $\mathbf{0}\mathfrak{B}^* \cap \mathbf{1}\mathfrak{B}^* = \varnothing$. Thus, $\mathfrak{B}^* \setminus \mathbf{1}\mathfrak{B}^* = \{\varnothing\} \cup \mathbf{0}\mathfrak{B}^*$ [1127].

Now, let us forget that we fixed u and v. We thus have proven that if u and v are two words in $\mathfrak{A}^*$ satisfying $u < v$, then $\Phi(u) < \Phi(v)$ in $\mathfrak{B}^*$. In other words, the map Φ is strictly order-preserving, qed.

[1126] because any strictly order-preserving map from a totally ordered set to a poset must be injective

[1127] *Proof.* We have $\mathfrak{B}^* \setminus \{\varnothing\} = \mathbf{0}\mathfrak{B}^* \cup \mathbf{1}\mathfrak{B}^*$ and $\mathbf{0}\mathfrak{B}^* \cap \mathbf{1}\mathfrak{B}^* = \varnothing$. Thus, the sets $\mathbf{0}\mathfrak{B}^*$ and $\mathbf{1}\mathfrak{B}^*$ are disjoint and have union $\mathfrak{B}^* \setminus \{\varnothing\}$. In other words, the sets $\mathbf{0}\mathfrak{B}^*$ and $\mathbf{1}\mathfrak{B}^*$ are complementary subsets of $\mathfrak{B}^* \setminus \{\varnothing\}$. Hence, $(\mathbf{0}\mathfrak{B}^* \cup \mathbf{1}\mathfrak{B}^*) \setminus \mathbf{1}\mathfrak{B}^* = \mathbf{0}\mathfrak{B}^*$. Now,

$$\begin{aligned}\underbrace{\mathfrak{B}^*}_{=\{\varnothing\}\cup(\mathfrak{B}^*\setminus\{\varnothing\})} \setminus \mathbf{1}\mathfrak{B}^* &= (\{\varnothing\}\cup(\mathfrak{B}^*\setminus\{\varnothing\}))\setminus\mathbf{1}\mathfrak{B}^* = \underbrace{(\{\varnothing\}\setminus\mathbf{1}\mathfrak{B}^*)}_{=\{\varnothing\}} \cup \left(\underbrace{(\mathfrak{B}^*\setminus\{\varnothing\})}_{=(\mathbf{0}\mathfrak{B}^*\cup\mathbf{1}\mathfrak{B}^*)}\setminus\mathbf{1}\mathfrak{B}^*\right) \\ &= \{\varnothing\}\cup\underbrace{((\mathbf{0}\mathfrak{B}^*\cup\mathbf{1}\mathfrak{B}^*)\setminus\mathbf{1}\mathfrak{B}^*)}_{=\mathbf{0}\mathfrak{B}^*} = \{\varnothing\}\cup\mathbf{0}\mathfrak{B}^*,\end{aligned}$$

qed.

Furthermore, $\Phi\left(\mathfrak{A}^*\right) \subset \mathfrak{B}^* \setminus \mathbf{1}\mathfrak{B}^*$ [1128] and $\mathfrak{B}^* \setminus \mathbf{1}\mathfrak{B}^* \subset \Phi\left(\mathfrak{A}^*\right)$ [1129]. Combining these two relations, we obtain

$$\Phi\left(\mathfrak{A}^*\right) = \mathfrak{B}^* \setminus \mathbf{1}\mathfrak{B}^*. \tag{13.167.15}$$

[1128] *Proof.* Let $u \in \Phi\left(\mathfrak{A}^*\right)$. We will prove that $u \in \mathfrak{B}^* \setminus \mathbf{1}\mathfrak{B}^*$.

Indeed, there exists some $w \in \mathfrak{A}^*$ satisfying $u = \Phi(w)$ (since $u \in \Phi\left(\mathfrak{A}^*\right)$). Consider this w. If $w = \varnothing$, then $u = \Phi\left(\underbrace{w}_{=\varnothing}\right) = \Phi(\varnothing) = \varnothing \in \mathfrak{B}^* \setminus \mathbf{1}\mathfrak{B}^*$ (since clearly, $\varnothing \notin \mathbf{1}\mathfrak{B}^*$). Hence, if $w = \varnothing$, then $u \in \mathfrak{B}^* \setminus \mathbf{1}\mathfrak{B}^*$ is proven. Thus, for the rest of this proof, we can WLOG assume that we don't have $w = \varnothing$. Assume this.

The word w is nonempty (since $w \neq \varnothing$), so that $\ell(w) \geq 1$. Hence, the letter w_1 is well-defined. We have $w = \left(w_1, w_2, \ldots, w_{\ell(w)}\right)$ and thus

$$\begin{aligned}\Phi(w) &= \widetilde{w_1}\widetilde{w_2}\cdots\widetilde{w_{\ell(w)}} \qquad \text{(by the definition of } \Phi\text{)} \\ &= \underbrace{\widetilde{w_1}}_{\substack{=\mathbf{0}\mathbf{1}^{w_1-1} \\ \text{(by (13.167.8), applied} \\ \text{to } k=w_1\text{)}}} \left(\widetilde{w_2}\widetilde{w_3}\cdots\widetilde{w_{\ell(w)}}\right) = \mathbf{0}\underbrace{\mathbf{1}^{w_1-1}\left(\widetilde{w_2}\widetilde{w_3}\cdots\widetilde{w_{\ell(w)}}\right)}_{\in\mathfrak{B}^*} \in \mathbf{0}\mathfrak{B}^* \subset \{\varnothing\} \cup \mathbf{0}\mathfrak{B}^* = \mathfrak{B}^* \setminus \mathbf{1}\mathfrak{B}^*.\end{aligned}$$

Hence, $u = \Phi(w) \in \mathfrak{B}^* \setminus \mathbf{1}\mathfrak{B}^*$.

Now, let us forget that we fixed u. We thus have proven that $u \in \mathfrak{B}^* \setminus \mathbf{1}\mathfrak{B}^*$ for every $u \in \Phi\left(\mathfrak{A}^*\right)$. In other words, $\Phi\left(\mathfrak{A}^*\right) \subset \mathfrak{B}^* \setminus \mathbf{1}\mathfrak{B}^*$, qed.

[1129] *Proof.* We are going to show that

$$\text{every } u \in \mathfrak{B}^* \setminus \mathbf{1}\mathfrak{B}^* \text{ satisfies } u \in \Phi\left(\mathfrak{A}^*\right). \tag{13.167.13}$$

Proof of (13.167.13): We will prove (13.167.13) by strong induction over $\ell(u)$:

Induction step: Let $N \in \mathbb{N}$. Assume that (13.167.13) holds whenever $\ell(u) < N$. We now will prove that (13.167.13) holds whenever $\ell(u) = N$.

We know that (13.167.13) holds whenever $\ell(u) < N$. In other words,

$$\text{every } u \in \mathfrak{B}^* \setminus \mathbf{1}\mathfrak{B}^* \text{ satisfying } \ell(u) < N \text{ satisfies } u \in \Phi\left(\mathfrak{A}^*\right). \tag{13.167.14}$$

Now, fix an $u \in \mathfrak{B}^* \setminus \mathbf{1}\mathfrak{B}^*$ satisfying $\ell(u) = N$. We shall show that $u \in \Phi\left(\mathfrak{A}^*\right)$.

If $u = \varnothing$, then $u = \varnothing = \Phi(\varnothing) \in \Phi\left(\mathfrak{A}^*\right)$. Hence, for the rest of our proof of $u \in \Phi\left(\mathfrak{A}^*\right)$, we can WLOG assume that we don't have $u = \varnothing$. Assume this.

We have $u \neq \varnothing$ (since we don't have $u = \varnothing$), thus $u \notin \{\varnothing\}$. We have $u \in \mathfrak{B}^* \setminus \mathbf{1}\mathfrak{B}^* = \{\varnothing\} \cup \mathbf{0}\mathfrak{B}^*$ but $u \notin \{\varnothing\}$. Hence, $u \in \left(\{\varnothing\} \cup \mathbf{0}\mathfrak{B}^*\right) \setminus \{\varnothing\} \subset \mathbf{0}\mathfrak{B}^*$. In other words, there exists a $p \in \mathfrak{B}^*$ such that $u = \mathbf{0}p$. Consider this p. The one-letter word $\mathbf{0}$ is a prefix of u (since $u = \mathbf{0}p$).

Applying (13.167.8) to $k = 1$, we obtain $\widetilde{1} = \mathbf{0}\underbrace{\mathbf{1}^{1-1}}_{=\mathbf{1}^0=\varnothing} = \mathbf{0}$, so that $\widetilde{1}$ is a prefix of u (since $\mathbf{0}$ is a prefix of u). Hence, there exists a $k \in \mathfrak{A}$ such that $\widetilde{k}$ is a prefix of u (namely, $k = 1$).

On the other hand, if $k \in \mathfrak{A}$ is such that $\widetilde{k}$ is a prefix of u, then $\ell\left(\widetilde{k}\right) \leq \ell(u)$. Hence, if $k \in \mathfrak{A}$ is such that $\widetilde{k}$ is a prefix of u, then $\ell(u) \geq \ell\left(\widetilde{k}\right) = k$ (by (13.167.9)). Hence, if $k \in \mathfrak{A}$ is such that $\widetilde{k}$ is a prefix of u, then $k \leq \ell(u)$. Hence, only finitely many $k \in \mathfrak{A}$ have the property that $\widetilde{k}$ is a prefix of u (because only finitely many $k \in \mathfrak{A}$ have the property that $k \leq \ell(u)$).

We now have made the following two observations:

- There exists a $k \in \mathfrak{A}$ such that $\widetilde{k}$ is a prefix of u.
- Only finitely many $k \in \mathfrak{A}$ have the property that $\widetilde{k}$ is a prefix of u.

Combining these two observations, we conclude that there exists a **largest** $k \in \mathfrak{A}$ such that $\widetilde{k}$ is a prefix of u. Consider this largest k. Then, $\widetilde{k}$ is a prefix of u, but $\widetilde{k+1}$ is not a prefix of u.

There exists a $v \in \mathfrak{B}^*$ such that $u = \widetilde{k}v$ (since $\widetilde{k}$ is a prefix of u). Consider this v. We have $\ell\left(\underbrace{u}_{=\widetilde{k}v}\right) = \ell\left(\widetilde{k}v\right) = \underbrace{\ell\left(\widetilde{k}\right)}_{\substack{=k \\ \text{(by (13.167.9))}}} + \ell(v) = \underbrace{k}_{\substack{\geq 1 \\ \text{(since } k\in\mathfrak{A}\text{)}}} + \ell(v) \geq 1 + \ell(v) > \ell(v)$, so that $\ell(v) < \ell(u) = N$.

Let us now assume that $v \in \mathfrak{B}^* \setminus \mathbf{1}\mathfrak{B}^*$. Then, $v \in \Phi\left(\mathfrak{A}^*\right)$ (by (13.167.14), applied to v instead of u). In other words, there exists a $v' \in \mathfrak{A}^*$ such that $v = \Phi(v')$. Consider this v'. The definition of $\Phi(k)$ (where k stands for the one-letter word $(k) \in \mathfrak{A}^*$)

Next, we recall that $\mathfrak{L}_{\mathfrak{B}}$ is the set of all Lyndon words over the alphabet $\mathfrak{B}$. We notice that $\Phi\left(\mathfrak{L}\right) \subset \mathfrak{L}_{\mathfrak{B}} \setminus \{\mathbf{1}\}$ [1130] and $\mathfrak{L}_{\mathfrak{B}} \setminus \{\mathbf{1}\} \subset \Phi\left(\mathfrak{L}\right)$ [1131]. Combining the latter two relations, we obtain

$$\Phi\left(\mathfrak{L}\right) = \mathfrak{L}_{\mathfrak{B}} \setminus \{\mathbf{1}\} . \tag{13.167.16}$$

Hence, the map Φ restricts to a bijection $\mathfrak{L} \to \mathfrak{L}_{\mathfrak{B}} \setminus \{\mathbf{1}\}$.

Next, we notice that

$$\ell\left(\Phi\left(w\right)\right) = \left|w\right| \qquad \text{for every } w \in \mathfrak{A}^* \tag{13.167.17}$$

yields $\Phi\left(k\right) = \widetilde{k}$. Hence,

$$u = \underbrace{\widetilde{k}}_{=\Phi(k)} \underbrace{v}_{=\Phi(v')} = \Phi\left(k\right) \Phi\left(v'\right) = \Phi\left(kv'\right) \qquad (\text{since } \Phi \text{ is a monoid homomorphism})$$
$$\in \Phi\left(\mathfrak{A}^*\right).$$

Now, let us forget that we have assumed that $v \in \mathfrak{B}^* \setminus \mathbf{1}\mathfrak{B}^*$. We have thus proven that $u \in \Phi\left(\mathfrak{A}^*\right)$ under the assumption that $v \in \mathfrak{B}^* \setminus \mathbf{1}\mathfrak{B}^*$. Thus, for the rest of the proof of $u \in \Phi\left(\mathfrak{A}^*\right)$, we can WLOG assume that we don't have $v \in \mathfrak{B}^* \setminus \mathbf{1}\mathfrak{B}^*$. Assume this.

We have $v \in \mathbf{1}\mathfrak{B}^*$ (since we don't have $v \in \mathfrak{B}^* \setminus \mathbf{1}\mathfrak{B}^*$). Thus, there exists a $v' \in \mathfrak{B}^*$ such that $v = \mathbf{1}v'$. Consider this v'. We have

$$u = \widetilde{k} \underbrace{v}_{=\mathbf{1}v'} = \underbrace{\widetilde{k}\mathbf{1}}_{\substack{=\widetilde{k+1} \\ (\text{by (13.167.10)})}} v' = \left(\widetilde{k+1}\right) v'.$$

Hence, $\widetilde{k+1}$ is a prefix of u. This contradicts the fact that $\widetilde{k+1}$ is not a prefix of u. From this contradiction, we conclude that $u \in \Phi\left(\mathfrak{A}^*\right)$ (since ex falso quodlibet). Thus, $u \in \Phi\left(\mathfrak{A}^*\right)$ is proven.

Now, let us forget that we fixed u. We thus have shown that every $u \in \mathfrak{B}^* \setminus \mathbf{1}\mathfrak{B}^*$ satisfying $\ell\left(u\right) = N$ satisfies $u \in \Phi\left(\mathfrak{A}^*\right)$. In other words, (13.167.13) holds whenever $\ell\left(u\right) = N$. This completes the induction step. Thus, (13.167.13) is proven by induction.

But from (13.167.13), we immediately obtain $\mathfrak{B}^* \setminus \mathbf{1}\mathfrak{B}^* \subset \Phi\left(\mathfrak{A}^*\right)$, qed.

[1130] *Proof.* Let $u \in \Phi\left(\mathfrak{L}\right)$. We are going to prove that $u \in \mathfrak{L}_{\mathfrak{B}} \setminus \{\mathbf{1}\}$.

There exists a $w \in \mathfrak{L}$ such that $u = \Phi\left(w\right)$ (since $u \in \Phi\left(\mathfrak{L}\right)$). Consider this w. The word w is Lyndon (since $w \in \mathfrak{L}$), and thus nonempty. Hence, $\ell\left(w\right) \geq 1$.

Let $n = \ell\left(w\right)$. Thus, $n = \ell\left(w\right) \geq 1$. We have $w = \left(w_1, w_2, \ldots, w_{\ell(w)}\right) = \left(w_1, w_2, \ldots, w_n\right)$ (since $\ell\left(w\right) = n$).

We have $w = \left(w_1, w_2, \ldots, w_n\right)$, so that $\Phi\left(w\right) = \widetilde{w_1}\widetilde{w_2}\cdots\widetilde{w_n}$ (by the definition of $\Phi\left(w\right)$). For every $i \in \{1, 2, \ldots, n\}$, the word $\widetilde{w_i}$ is a Lyndon word over the alphabet $\mathfrak{B}$ (by (13.167.12), applied to $k = w_i$). Thus, $\widetilde{w}_1$, $\widetilde{w}_2$, $\ldots$, $\widetilde{w}_n$ are Lyndon words over the alphabet $\mathfrak{B}$.

Let now $i \in \{1, 2, \ldots, n\}$. Then, $\left(w_i, w_{i+1}, \ldots, w_n\right)$ is a nonempty suffix of w (since $w = \left(w_1, w_2, \ldots, w_n\right)$).

Recall that w is Lyndon. Hence, Corollary 6.1.15 (applied to $v = \left(w_i, w_{i+1}, \ldots, w_n\right)$) yields that $\left(w_i, w_{i+1}, \ldots, w_n\right) \geq w$ (since $\left(w_i, w_{i+1}, \ldots, w_n\right)$ is a nonempty suffix of w). Hence, $\Phi\left(\left(w_i, w_{i+1}, \ldots, w_n\right)\right) \geq \Phi\left(w\right)$ (since the map Φ is strictly order-preserving). But the definition of the map Φ yields $\Phi\left(\left(w_i, w_{i+1}, \ldots, w_n\right)\right) = \widetilde{w_i}\widetilde{w_{i+1}}\cdots\widetilde{w_n}$. Thus, $\widetilde{w_i}\widetilde{w_{i+1}}\cdots\widetilde{w_n} = \Phi\left(\left(w_i, w_{i+1}, \ldots, w_n\right)\right) \geq \Phi\left(w\right) = \widetilde{w_1}\widetilde{w_2}\cdots\widetilde{w_n}$.

Now, let us forget that we fixed i. We thus have shown that $\widetilde{w_i}\widetilde{w_{i+1}}\cdots\widetilde{w_n} \geq \widetilde{w_1}\widetilde{w_2}\cdots\widetilde{w_n}$ for every $i \in \{1, 2, \ldots, n\}$. Hence, Exercise 6.1.24 (applied to $\mathfrak{B}$ and $\widetilde{w_i}$ instead of $\mathfrak{A}$ and w_i) yields that $\widetilde{w_1}\widetilde{w_2}\cdots\widetilde{w_n}$ is a Lyndon word. In other words, u is a Lyndon word (since $u = \Phi\left(w\right) = \widetilde{w_1}\widetilde{w_2}\cdots\widetilde{w_n}$). More precisely, u is a Lyndon word over the alphabet $\mathfrak{B}$. In other words, $u \in \mathfrak{L}_{\mathfrak{B}}$ (since $\mathfrak{L}_{\mathfrak{B}}$ is the set of all Lyndon words over the alphabet $\mathfrak{B}$).

On the other hand, $u \in \Phi\left(\underbrace{\mathfrak{L}}_{\subset\mathfrak{A}^*}\right) \subset \Phi\left(\mathfrak{A}^*\right) = \mathfrak{B}^* \setminus \mathbf{1}\mathfrak{B}^*$ (by (13.167.15)), so that $u \notin \mathbf{1}\mathfrak{B}^*$. Hence, we cannot have $u = \mathbf{1}$ (because if we had $u = \mathbf{1}$, we would have $u = \mathbf{1} = \mathbf{1}\underbrace{\varnothing}_{\in\mathfrak{B}^*} \in \mathbf{1}\mathfrak{B}^*$, which would contradict $u \notin \mathbf{1}\mathfrak{B}^*$). Thus, we have $u \neq \mathbf{1}$, so that $u \notin \{\mathbf{1}\}$. Combined with $u \in \mathfrak{L}_{\mathfrak{B}}$, this yields $u \in \mathfrak{L}_{\mathfrak{B}} \setminus \{\mathbf{1}\}$.

Now, let us forget that we fixed u. We thus have proven that $u \in \mathfrak{L}_{\mathfrak{B}} \setminus \{\mathbf{1}\}$ for every $u \in \Phi\left(\mathfrak{L}\right)$. In other words, $\Phi\left(\mathfrak{L}\right) \subset \mathfrak{L}_{\mathfrak{B}} \setminus \{\mathbf{1}\}$, qed.

[1131] *Proof.* Let $u \in \mathfrak{L}_{\mathfrak{B}} \setminus \{\mathbf{1}\}$. We are going to prove that $u \in \Phi\left(\mathfrak{L}\right)$.

We have $u \in \mathfrak{L}_{\mathfrak{B}} \setminus \{\mathbf{1}\} \subset \mathfrak{L}_{\mathfrak{B}}$. Thus, u is a Lyndon word over the alphabet $\mathfrak{B}$ (since $\mathfrak{L}_{\mathfrak{B}}$ is the set of all Lyndon words over the alphabet $\mathfrak{B}$). Also, $u \notin \{\mathbf{1}\}$ (since $u \in \mathfrak{L}_{\mathfrak{B}} \setminus \{\mathbf{1}\}$), so that $u \neq \mathbf{1}$.

Let us now assume (for the sake of contradiction) that $u \in \mathbf{1}\mathfrak{B}^*$. Then, there exists a $u' \in \mathfrak{B}^*$ such that $u = \mathbf{1}u'$. Consider this u'.

The word u is nonempty (since it is Lyndon), and thus the last letter of u is well-defined. Let g be this last letter of u. Then, g is a suffix of u. Clearly, g is nonempty (when regarded as a word). Thus, Corollary 6.1.15 (applied to $\mathfrak{B}$, u and g instead of $\mathfrak{A}$, w and v) yields $g \geq u = \mathbf{1}u'$, so that $\mathbf{1}u' \leq g = g\varnothing$. Also, $\ell\left(g\right) \geq 1$ (since g is nonempty), whence $\ell\left(g\right) \geq 1 = \ell\left(\mathbf{1}\right)$ and thus $\ell\left(\mathbf{1}\right) \leq \ell\left(g\right)$. Now, Proposition 6.1.2(f) (applied to $\mathfrak{B}$, $\mathbf{1}$, u', g and $\varnothing$ instead of $\mathfrak{A}$, a, b, c and d) yields $\mathbf{1} \leq g$. Thus, $g \geq \mathbf{1}$. Since g is a single letter, this yields that $g = \mathbf{1}$ (because the only letter of $\mathfrak{B}$ which is $\geq \mathbf{1}$ is $\mathbf{1}$ itself). Thus, $\mathbf{1}u' \leq g = \mathbf{1} = \mathbf{1}\varnothing$. Now, Proposition 6.1.2(f) (applied to $\mathfrak{B}$, $\mathbf{1}$, u' and $\varnothing$ instead of $\mathfrak{A}$, a, c and d) yields $u' \leq \varnothing$. This yields $u' = \varnothing$ (since the only (where the notation $|w|$ makes sense because every $w \in \mathfrak{A}^*$ is a composition and thus has a size)[1132].

[Incidentally, here is a similar identity which will not use:

$$(13.167.18) \qquad (\text{the number of letters } \mathbf{0} \text{ in } \Phi(w)) = \ell(w) \qquad \text{for every } w \in \mathfrak{A}^*$$

[1133].]

Now, fix a positive integer n. The alphabet $\mathfrak{B}$ is finite and satisfies $2 = |\mathfrak{B}|$. Hence, Exercise 6.1.29 (applied to $\mathfrak{B}$ and 2 instead of $\mathfrak{A}$ and q) yields that the number of Lyndon words of length n over the alphabet $\mathfrak{B}$ equals $\dfrac{1}{n}\sum_{d|n}\mu(d)\,2^{n/d}$. That is,

$$(13.167.20) \qquad (\text{the number of all Lyndon words of length } n \text{ over the alphabet } \mathfrak{B}) = \frac{1}{n}\sum_{d|n}\mu(d)\,2^{n/d}.$$

word which is $\leq \varnothing$ is $\varnothing$ itself). Hence, $u = \mathbf{1}\underbrace{u'}_{=\varnothing} = \mathbf{1}$, which contradicts $u \neq \mathbf{1}$. This contradiction shows that our assumption (that $u \in \mathbf{1}\mathfrak{B}^*$) was wrong. Hence, we have $u \notin \mathbf{1}\mathfrak{B}^*$.

Since $u \in \mathfrak{B}^*$ and $u \notin \mathbf{1}\mathfrak{B}^*$, we must have $u \in \mathfrak{B}^* \setminus \mathbf{1}\mathfrak{B}^* = \Phi(\mathfrak{A}^*)$ (by (13.167.15)). In other words, there exists a $w \in \mathfrak{A}^*$ such that $u = \Phi(w)$. Consider this w.

We have $u \neq \varnothing$ (since u is nonempty) and thus $w \neq \varnothing$ (because otherwise, we would have $w = \varnothing$ and thus $u = \Phi\left(\underbrace{w}_{=\varnothing}\right) = \Phi(\varnothing) = \varnothing$, contradicting $u \neq \varnothing$). Hence, the word w is nonempty.

Let now v be a nonempty proper suffix of w. We assume (for the sake of contradiction) that $v \leq w$. Since $v \neq w$ (because v is a **proper** suffix of w) and $v \leq w$, we have $v < w$. Thus, $\Phi(v) < \Phi(w)$ (since the map Φ is strictly order-preserving). Hence, $\Phi(v) < \Phi(w) = u$.

Also, $v \neq \varnothing$ (since v is nonempty). Thus, $\Phi(v) \neq \Phi(\varnothing)$ (because otherwise, we would have $\Phi(v) = \Phi(\varnothing)$, so that $v = \varnothing$ (since the map Φ is injective), which would contradict $v \neq \varnothing$). Hence, $\Phi(v) \neq \Phi(\varnothing) = \varnothing$, so that the word $\Phi(v)$ is nonempty.

But there exists a $p \in \mathfrak{A}^*$ such that $w = pv$ (since v is a suffix of w). Consider this p. We have $u = \Phi\left(\underbrace{w}_{=pv}\right) = \Phi(pv) = \Phi(p)\,\Phi(v)$ (since Φ is a monoid homomorphism). Thus, $\Phi(v)$ is a suffix of u. Now, Corollary 6.1.15 (applied to $\mathfrak{B}$, u and $\Phi(v)$ instead of $\mathfrak{A}$, w and v) yields $\Phi(v) \geq u$. This contradicts $\Phi(v) < u$. This contradiction shows that our assumption (that $v \leq w$) was wrong. Hence, we cannot have $v \leq w$. We thus have $v > w$.

Now, let us forget that we fixed v. We thus have proven that every nonempty proper suffix v of w satisfies $v > w$. Since the word w is nonempty, this yields that the word w is Lyndon (by the definition of a Lyndon word). In other words, $w \in \mathfrak{L}$ (since $\mathfrak{L}$ is the set of all Lyndon words over the alphabet $\mathfrak{A}$). Now, $u = \Phi\left(\underbrace{w}_{\in\mathfrak{L}}\right) \in \Phi(\mathfrak{L})$.

Now, let us forget that we fixed u. We thus have shown that $u \in \Phi(\mathfrak{L})$ for every $u \in \mathfrak{L}_{\mathfrak{B}} \setminus \{\mathbf{1}\}$. In other words, $\mathfrak{L}_{\mathfrak{B}} \setminus \{\mathbf{1}\} \subset \Phi(\mathfrak{L})$, qed.

[1132] *Proof.* Let $w \in \mathfrak{A}^*$. Then, $w = \left(w_1, w_2, \ldots, w_{\ell(w)}\right)$, so that $\Phi(w) = \widetilde{w_1}\widetilde{w_2}\cdots\widetilde{w_{\ell(w)}}$ (by the definition of $\Phi(w)$). Hence,

$$\ell\left(\underbrace{\Phi(w)}_{=\widetilde{w_1}\widetilde{w_2}\cdots\widetilde{w_{\ell(w)}}}\right) = \ell\left(\widetilde{w_1}\widetilde{w_2}\cdots\widetilde{w_{\ell(w)}}\right) = \ell(\widetilde{w_1}) + \ell(\widetilde{w_2}) + \cdots + \ell\left(\widetilde{w_{\ell(w)}}\right) = \sum_{i=1}^{\ell(w)} \underbrace{\ell(\widetilde{w_i})}_{\substack{=w_i \\ \text{(by (13.167.9), applied to } k=w_i)}}$$
$$= \sum_{i=1}^{\ell(w)} w_i = w_1 + w_2 + \cdots + w_{\ell(w)} = |w|$$

(since $|w| = w_1 + w_2 + \cdots + w_{\ell(w)}$ (since $w = \left(w_1, w_2, \ldots, w_{\ell(w)}\right)$)), qed.

[1133] *Proof.* Let $w \in \mathfrak{A}^*$.

We notice that

$$(13.167.19) \qquad \left(\text{the number of letters } \mathbf{0} \text{ in } \underbrace{\widetilde{k}}_{\substack{=\mathbf{0}\mathbf{1}^{k-1} \\ \text{(by (13.167.8))}}}\right) = \left(\text{the number of letters } \mathbf{0} \text{ in } \mathbf{0}\mathbf{1}^{k-1}\right) = 1$$

for every $k \in \mathfrak{A}$.

Now, let $\operatorname{lync} n$ denote the number of Lyndon compositions of size n. We need to prove that

$$\operatorname{lync} n = \frac{1}{n}\sum_{d\mid n}\mu(d)\left(2^{n/d}-1\right) = \frac{1}{n}\sum_{d\mid n}\mu(d)\,2^{n/d}-\delta_{n,1}. \qquad (13.167.21)$$

By the definition of $\operatorname{lync} n$, we have

$$\begin{aligned}
\operatorname{lync} n &= (\text{the number of Lyndon compositions of size } n)\\
&= (\text{the number of all } w\in\mathfrak{L} \text{ such that } |w|=n)\\
&\qquad (\text{since the set of all Lyndon compositions is } \mathfrak{L})\\
&= \left|\left\{ w\in\mathfrak{L} \ \mid\ \underbrace{|w|}_{\substack{=\ell(\Phi(w))\\ (\text{by (13.167.17)})}} = n\right\}\right|\\
&= \left|\left\{ w\in\mathfrak{L} \ \mid\ \ell(\Phi(w))=n\right\}\right| = \left|\underbrace{\left\{ w\in\mathfrak{L}_{\mathfrak{B}}\setminus\{\mathbf{1}\} \ \mid\ \ell(w)=n\right\}}_{=\{w\in\mathfrak{L}_{\mathfrak{B}}\ \mid\ \ell(w)=n\}\setminus\{w\in\{\mathbf{1}\}\ \mid\ \ell(w)=n\}}\right|\\
&\qquad \left(\begin{array}{c}\text{here, we have substituted } w \text{ for } \Phi(w)\text{, since the map}\\ \Phi \text{ restricts to a bijection } \mathfrak{L}\to\mathfrak{L}_{\mathfrak{B}}\setminus\{\mathbf{1}\}\end{array}\right)\\
&= \left|\left\{ w\in\mathfrak{L}_{\mathfrak{B}} \ \mid\ \ell(w)=n\right\}\setminus\left\{ w\in\{\mathbf{1}\} \ \mid\ \ell(w)=n\right\}\right|\\
&= \underbrace{\left|\left\{ w\in\mathfrak{L}_{\mathfrak{B}} \ \mid\ \ell(w)=n\right\}\right|}_{\substack{=(\text{the number of all } w\in\mathfrak{L}_{\mathfrak{B}} \text{ such that } \ell(w)=n)\\ =(\text{the number of all Lyndon words of length } n \text{ over the alphabet } \mathfrak{B})\\ (\text{since } \mathfrak{L}_B \text{ is the set of all Lyndon words over the alphabet } \mathfrak{B})}} - \underbrace{\left|\left\{ w\in\{\mathbf{1}\} \ \mid\ \ell(w)=n\right\}\right|}_{\substack{=\delta_{n,1}\\ (\text{since } \ell(\mathbf{1})=1)}}\\
&\qquad \left(\text{since } \left\{ w\in\underbrace{\{\mathbf{1}\}}_{\subset\mathfrak{L}_{\mathfrak{B}}} \ \mid\ \ell(w)=n\right\} \subset \left\{ w\in\mathfrak{L}_{\mathfrak{B}} \ \mid\ \ell(w)=n\right\}\right)\\
&= \underbrace{(\text{the number of all Lyndon words of length } n \text{ over the alphabet } \mathfrak{B})}_{\substack{=\frac{1}{n}\sum_{d\mid n}\mu(d)2^{n/d}\\ (\text{by (13.167.20)})}} - \delta_{n,1}\\
&= \frac{1}{n}\sum_{d\mid n}\mu(d)\,2^{n/d}-\delta_{n,1} = \frac{1}{n}\sum_{d\mid n}\mu(d)\left(2^{n/d}-1\right)
\end{aligned}$$

(by Lemma 13.167.2). This solves Exercise 6.4.2 again.

We have $w=\left(w_1,w_2,\ldots,w_{\ell(w)}\right)$, so that $\Phi(w)=\widetilde{w_1}\widetilde{w_2}\cdots\widetilde{w_{\ell(w)}}$ (by the definition of $\Phi(w)$). Hence,

$$\begin{aligned}
&\left(\text{the number of letters } \mathbf{0} \text{ in } \underbrace{\Phi(w)}_{=\widetilde{w_1}\widetilde{w_2}\cdots\widetilde{w_{\ell(w)}}}\right)\\
&= \left(\text{the number of letters } \mathbf{0} \text{ in } \widetilde{w_1}\widetilde{w_2}\cdots\widetilde{w_{\ell(w)}}\right)\\
&= \left(\text{the number of letters } \mathbf{0} \text{ in } \widetilde{w_1}\right) + \left(\text{the number of letters } \mathbf{0} \text{ in } \widetilde{w_2}\right)\\
&\qquad + \cdots + \left(\text{the number of letters } \mathbf{0} \text{ in } \widetilde{w_{\ell(w)}}\right)\\
&= \sum_{i=1}^{\ell(w)} \underbrace{\left(\text{the number of letters } \mathbf{0} \text{ in } \widetilde{w_i}\right)}_{\substack{=1\\ (\text{by (13.167.19), applied to } k=w_i)}} = \sum_{i=1}^{\ell(w)} 1 = \ell(w),
\end{aligned}$$

qed.

13.168. **Solution to Exercise 6.4.6.** *Solution to Exercise 6.4.6.*

Proof of Proposition 6.4.5. Write α and β as $\alpha = (\alpha_1, \alpha_2, \ldots, \alpha_\ell)$ and $\beta = (\beta_1, \beta_2, \ldots, \beta_m)$, respectively; then $\ell(\alpha) = \ell$ and $\ell(\beta) = m$.

Fix three disjoint chain posets $(i_1 < i_2 < \cdots < i_\ell)$, $(j_1 < j_2 < \cdots < j_m)$ and $(k_1 < k_2 < k_3 < \cdots)$. For any $p \in \mathbb{N}$, we define a *p-shuffling map* to mean a map f from the disjoint union of two chains to a chain

$$(i_1 < i_2 < \cdots < i_\ell) \sqcup (j_1 < j_2 < \cdots < j_m) \xrightarrow{f} (k_1 < k_2 < \cdots < k_p)$$

which is both surjective and strictly order-preserving (that is, if x and y are two elements in the domain of f satisfying $x < y$, then $f(x) < f(y)$). For every $p \in \mathbb{N}$ and every p-shuffling map f, we define a composition $\operatorname{wt}(f) := (\operatorname{wt}_1(f), \operatorname{wt}_2(f), \ldots, \operatorname{wt}_p(f))$ by $\operatorname{wt}_s(f) := \sum_{i_u \in f^{-1}(k_s)} \alpha_u + \sum_{j_v \in f^{-1}(k_s)} \beta_v$. Then, Proposition 5.1.3 yields

$$M_\alpha M_\beta = \sum_f M_{\operatorname{wt}(f)},$$

where the sum is over all $p \in \mathbb{N}$ and all p-shuffling maps f. In other words,

$$\begin{align*}
M_\alpha M_\beta &= \sum_{\substack{(p,f);\\ p\in\mathbb{N};\\ f \text{ is a } p\text{-shuffling map}}} M_{\operatorname{wt}(f)} = \sum_{p\in\mathbb{N}} \sum_{f \text{ is a } p\text{-shuffling map}} M_{\operatorname{wt}(f)} \\
&= \sum_{\substack{p\in\mathbb{N};\\ p\leq\ell+m}} \sum_{f \text{ is a } p\text{-shuffling map}} M_{\operatorname{wt}(f)} + \sum_{\substack{p\in\mathbb{N};\\ p>\ell+m}} \underbrace{\sum_{f \text{ is a } p\text{-shuffling map}} M_{\operatorname{wt}(f)}}_{\substack{=(\text{empty sum})\\ (\text{because there exist no } p\text{-shuffling maps if } p>\ell+m\\ (\text{since a } p\text{-shuffling map has to be a surjective map}\\ \text{from an } (\ell+m)\text{-element set to a } p\text{-element set,}\\ \text{and such maps don't exist if } p>\ell+m))}} \\
&= \sum_{\substack{p\in\mathbb{N};\\ p\leq\ell+m}} \sum_{f \text{ is a } p\text{-shuffling map}} M_{\operatorname{wt}(f)} + \sum_{\substack{p\in\mathbb{N};\\ p>\ell+m}} \underbrace{(\text{empty sum})}_{=0} \\
&= \sum_{\substack{p\in\mathbb{N};\\ p\leq\ell+m}} \sum_{f \text{ is a } p\text{-shuffling map}} M_{\operatorname{wt}(f)} + \underbrace{\sum_{\substack{p\in\mathbb{N};\\ p>\ell+m}} 0}_{=0} = \sum_{\substack{p\in\mathbb{N};\\ p\leq\ell+m}} \sum_{f \text{ is a } p\text{-shuffling map}} M_{\operatorname{wt}(f)} \tag{13.168.1} \\
&= \sum_{f \text{ is an } (\ell+m)\text{-shuffling map}} M_{\operatorname{wt}(f)} + \sum_{\substack{p\in\mathbb{N};\\ p<\ell+m}} \sum_{f \text{ is a } p\text{-shuffling map}} M_{\operatorname{wt}(f)} \tag{13.168.2}
\end{align*}$$

(here, we have split off the addend for $p = \ell + m$ from the sum).

We now notice that

$$\begin{align*}
&\sum_{\substack{p\in\mathbb{N};\\ p<\ell+m}} \sum_{f \text{ is a } p\text{-shuffling map}} M_{\operatorname{wt}(f)} \\
&= (\text{a sum of terms of the form } M_\delta \text{ with } \delta \in \mathfrak{A}^* \text{ satisfying } \ell(\delta) < \ell(\alpha) + \ell(\beta)) \tag{13.168.3}
\end{align*}$$

[1134]. Our next goal is to prove

$$\sum_{f \text{ is an } (\ell+m)\text{-shuffling map}} M_{\operatorname{wt}(f)} = \sum_{\sigma \in \operatorname{Sh}_{\ell,m}} M_{\alpha \underset{\sigma}{\sqcup\!\sqcup} \beta}. \tag{13.168.4}$$

[1134] *Proof of (13.168.3):* If $p \in \mathbb{N}$ is such that $p < \ell + m$, and if f is a p-shuffling map, then $\operatorname{wt}(f) = (\operatorname{wt}_1(f), \ldots, \operatorname{wt}_p(f))$ is a composition of length $p < \underbrace{\ell}_{=\ell(\alpha)} + \underbrace{m}_{=\ell(\beta)} = \ell(\alpha) + \ell(\beta)$. Hence, if $p \in \mathbb{N}$ is such that $p < \ell + m$, and if f is a p-shuffling map, then $M_{\operatorname{wt}(f)}$ is a term of the form M_δ with $\delta \in \mathfrak{A}^*$ satisfying $\ell(\delta) < \ell(\alpha) + \ell(\beta)$. Therefore, $\sum\limits_{\substack{p\in\mathbb{N};\\ p<\ell+m}} \sum_{f \text{ is a } p\text{-shuffling map}} M_{\operatorname{wt}(f)}$ is a sum of terms of the form M_δ with $\delta \in \mathfrak{A}^*$ satisfying $\ell(\delta) < \ell(\alpha) + \ell(\beta)$. This proves (13.168.3).

Once (13.168.4) is proven, we will immediately conclude that

$$\sum_{f \text{ is an } (\ell+m)\text{-shuffling map}} M_{\operatorname{wt}(f)} = \sum_{\sigma \in \operatorname{Sh}_{\ell,m}} M_{\alpha \underset{\sigma}{\sqcup\!\sqcup} \beta} = \sum_{\gamma \in \alpha \sqcup\!\sqcup \beta} M_\gamma$$

(since the multiset $\alpha \sqcup\!\sqcup \beta$ is defined as $\left\{\alpha \underset{\sigma}{\sqcup\!\sqcup} \beta \ : \ \sigma \in \operatorname{Sh}_{\ell,m}\right\}_{\text{multiset}}$), and therefore we will obtain

$$M_\alpha M_\beta = \underbrace{\sum_{f \text{ is an } (\ell+m)\text{-shuffling map}} M_{\operatorname{wt}(f)}}_{=\sum_{\gamma\in\alpha\sqcup\!\sqcup\beta} M_\gamma} + \underbrace{\sum_{\substack{p\in\mathbb{N};\\ p<\ell+m}} \sum_{f \text{ is a } p\text{-shuffling map}} M_{\operatorname{wt}(f)}}_{\substack{=(\text{a sum of terms of the form } M_\delta \text{ with } \delta\in\mathfrak{A}^* \text{ satisfying } \ell(\delta)<\ell(\alpha)+\ell(\beta))\\ (\text{by } (13.168.3))}}$$

$$= \sum_{\gamma\in\alpha\sqcup\!\sqcup\beta} M_\gamma + (\text{a sum of terms of the form } M_\delta \text{ with } \delta \in \mathfrak{A}^* \text{ satisfying } \ell(\delta) < \ell(\alpha) + \ell(\beta)),$$

which will complete the proof of Proposition 6.4.5. Hence, it only remains to prove (13.168.4).

We let D be the poset $(i_1 < i_2 < \cdots < i_\ell) \sqcup (j_1 < j_2 < \cdots < j_m)$, and we let R be the poset $(k_1 < k_2 < \cdots < k_{\ell+m})$. Note that $|D| = \ell + m = |R|$. Hence, D and R are two finite sets of the same cardinality. Consequently, a given map from D to R is surjective if and only if it is bijective.[1135]

Recall that an $(\ell+m)$-shuffling map means a map f from $(i_1 < i_2 < \cdots < i_\ell) \sqcup (j_1 < j_2 < \cdots < j_m)$ to $(k_1 < k_2 < \cdots < k_{\ell+m})$ which is both surjective and strictly order-preserving (by the definition of an "$(\ell+m)$-shuffling map"). In other words, an $(\ell+m)$-shuffling map means a map f from D to R which is both surjective and strictly order-preserving[1136]. In other words, an $(\ell+m)$-shuffling map means a map f from D to R which is both bijective and strictly order-preserving[1137].

Let us now define a bijection $\mathbf{d} : \{1, 2, \ldots, \ell+m\} \to D$ by

$$\mathbf{d}(u) = \begin{cases} i_u, & \text{if } u \leq \ell; \\ j_{u-\ell}, & \text{if } u > \ell \end{cases} \qquad \text{for every } u \in \{1, 2, \ldots, \ell+m\}.$$

Let us further define a bijection $\mathbf{r} : \{1, 2, \ldots, \ell+m\} \to R$ by

$$\mathbf{r}(u) = k_u \qquad \text{for every } u \in \{1, 2, \ldots, \ell+m\}.$$

Notice that $\mathbf{r}$ is an isomorphism of posets, where we endow the set $\{1, 2, \ldots, \ell+m\}$ with its natural total order (i.e., the order $1 < 2 < \cdots < \ell+m$).

We can then define a bijection

$$\Phi : (\text{the set of all bijective maps from } \{1, 2, \ldots, \ell+m\} \text{ to } \{1, 2, \ldots, \ell+m\})$$
$$\to (\text{the set of all bijective maps from } D \text{ to } R)$$

by setting

$$\Phi(\sigma) = \mathbf{r} \circ \sigma \circ \mathbf{d}^{-1} \qquad \text{for every bijective map } \sigma : \{1, 2, \ldots, \ell+m\} \to \{1, 2, \ldots, \ell+m\}.$$

[1138] Consider this bijection Φ. Then, Φ is a bijection from $\mathfrak{S}_{\ell+m}$ to (the set of all bijective maps from D to R) (because (the set of all bijective maps from $\{1, 2, \ldots, \ell+m\}$ to $\{1, 2, \ldots, \ell+m\}$) $= \mathfrak{S}_{\ell+m}$). It is now easy to see that if $\sigma \in \mathfrak{S}_{\ell+m}$, then we have the following equivalence of assertions:

$$(\sigma \in \operatorname{Sh}_{\ell,m}) \Longleftrightarrow \left(\text{the map } \Phi\left(\sigma^{-1}\right) : D \to R \text{ is strictly order-preserving}\right). \tag{13.168.5}$$

[1139] Moreover, every $\sigma \in \operatorname{Sh}_{\ell,m}$ satisfies

$$\operatorname{wt}\left(\Phi\left(\sigma^{-1}\right)\right) = \alpha \underset{\sigma}{\sqcup\!\sqcup} \beta. \tag{13.168.9}$$

[1135] Of course, the letters D and R have been chosen to remind of "domain" and "range".

[1136] since $D = (i_1 < i_2 < \cdots < i_\ell) \sqcup (j_1 < j_2 < \cdots < j_m)$ and $R = (k_1 < k_2 < \cdots < k_{\ell+m})$

[1137] This is because a given map from D to R is surjective if and only if it is bijective.

[1138] This is a bijection since both $\mathbf{d}$ and $\mathbf{r}$ are bijections.

[1139] *Proof of (13.168.5):* Let $\sigma \in \mathfrak{S}_{\ell+m}$. The poset D is the disjoint union of the totally ordered posets $(i_1 < i_2 < \cdots < i_\ell)$ and $(j_1 < j_2 < \cdots < j_m)$. Hence, if P is any other poset, and $f : D \to P$ is any map, then the map $f : D \to P$ is strictly order-preserving if and only if it satisfies

$$(f(i_1) < f(i_2) < \cdots < f(i_\ell) \text{ and } f(j_1) < f(j_2) < \cdots < f(j_m)).$$

[1140]

Now, recall that an $(\ell+m)$-shuffling map means a map f from D to R which is both bijective and strictly order-preserving. In other words, an $(\ell+m)$-shuffling map means a bijective map from D to R which is

---

Applying this to $P=R$ and $f=\Phi\left(\sigma^{-1}\right)$, we conclude that the map $\Phi\left(\sigma^{-1}\right):D\to R$ is strictly order-preserving if and only if it satisfies

$$\left(\left(\Phi\left(\sigma^{-1}\right)\right)(i_1)<\left(\Phi\left(\sigma^{-1}\right)\right)(i_2)<\cdots<\left(\Phi\left(\sigma^{-1}\right)\right)(i_\ell)\right.$$
$$\left.\text{and }\left(\Phi\left(\sigma^{-1}\right)\right)(j_1)<\left(\Phi\left(\sigma^{-1}\right)\right)(j_2)<\cdots<\left(\Phi\left(\sigma^{-1}\right)\right)(j_m)\right).$$

In other words, we have the following equivalence of assertions:

$$\begin{aligned}&\left(\text{the map }\Phi\left(\sigma^{-1}\right):D\to R\text{ is strictly order-preserving}\right)\\&\iff\left(\left(\Phi\left(\sigma^{-1}\right)\right)(i_1)<\left(\Phi\left(\sigma^{-1}\right)\right)(i_2)<\cdots<\left(\Phi\left(\sigma^{-1}\right)\right)(i_\ell)\right.\\&\qquad\left.\text{and }\left(\Phi\left(\sigma^{-1}\right)\right)(j_1)<\left(\Phi\left(\sigma^{-1}\right)\right)(j_2)<\cdots<\left(\Phi\left(\sigma^{-1}\right)\right)(j_m)\right).\end{aligned}\tag{13.168.6}$$

Now, recall that $\Phi\left(\sigma^{-1}\right)=\mathbf{r}\circ\sigma^{-1}\circ\mathbf{d}^{-1}$ (by the definition of Φ). Hence, every $u\in\{1,2,\ldots,\ell\}$ satisfies

$$\left(\Phi\left(\sigma^{-1}\right)\right)(i_u)=\left(\mathbf{r}\circ\sigma^{-1}\circ\mathbf{d}^{-1}\right)(i_u)=\mathbf{r}\left(\sigma^{-1}\left(\underbrace{\mathbf{d}^{-1}(i_u)}_{\substack{=u\\(\text{since }\mathbf{d}(u)=i_u\\(\text{by the definition of }\mathbf{d}))}}\right)\right)=\mathbf{r}\left(\sigma^{-1}(u)\right).$$

Hence, we have the following equivalence of assertions:

$$\begin{aligned}&\left(\left(\Phi\left(\sigma^{-1}\right)\right)(i_1)<\left(\Phi\left(\sigma^{-1}\right)\right)(i_2)<\cdots<\left(\Phi\left(\sigma^{-1}\right)\right)(i_\ell)\right)\\&\iff\left(\mathbf{r}\left(\sigma^{-1}(1)\right)<\mathbf{r}\left(\sigma^{-1}(2)\right)<\cdots<\mathbf{r}\left(\sigma^{-1}(\ell)\right)\right)\\&\iff\left(\sigma^{-1}(1)<\sigma^{-1}(2)<\cdots<\sigma^{-1}(\ell)\right)\qquad(\text{since }\mathbf{r}\text{ is an isomorphism of posets}).\end{aligned}\tag{13.168.7}$$

Similarly, we have the following equivalence of assertions:

$$\begin{aligned}&\left(\left(\Phi\left(\sigma^{-1}\right)\right)(j_1)<\left(\Phi\left(\sigma^{-1}\right)\right)(j_2)<\cdots<\left(\Phi\left(\sigma^{-1}\right)\right)(j_m)\right)\\&\iff\left(\sigma^{-1}(\ell+1)<\sigma^{-1}(\ell+2)<\cdots<\sigma^{-1}(\ell+m)\right).\end{aligned}\tag{13.168.8}$$

Now, the equivalence (13.168.6) becomes

$$\begin{aligned}&\left(\text{the map }\Phi\left(\sigma^{-1}\right):D\to R\text{ is strictly order-preserving}\right)\\&\iff\left(\underbrace{\left(\Phi\left(\sigma^{-1}\right)\right)(i_1)<\left(\Phi\left(\sigma^{-1}\right)\right)(i_2)<\cdots<\left(\Phi\left(\sigma^{-1}\right)\right)(i_\ell)}_{\substack{\text{this is equivalent to}\\(\sigma^{-1}(1)<\sigma^{-1}(2)<\cdots<\sigma^{-1}(\ell))\\(\text{by (13.168.7)})}}\right.\\&\qquad\left.\text{and }\underbrace{\left(\Phi\left(\sigma^{-1}\right)\right)(j_1)<\left(\Phi\left(\sigma^{-1}\right)\right)(j_2)<\cdots<\left(\Phi\left(\sigma^{-1}\right)\right)(j_m)}_{\substack{\text{this is equivalent to}\\(\sigma^{-1}(\ell+1)<\sigma^{-1}(\ell+2)<\cdots<\sigma^{-1}(\ell+m))\\(\text{by (13.168.8)})}}\right)\\&\iff\left(\sigma^{-1}(1)<\sigma^{-1}(2)<\cdots<\sigma^{-1}(\ell)\text{ and }\sigma^{-1}(\ell+1)<\sigma^{-1}(\ell+2)<\cdots<\sigma^{-1}(\ell+m)\right)\\&\iff\left(\sigma\in\operatorname{Sh}_{\ell,m}\right)\qquad\left(\text{by the definition of }\operatorname{Sh}_{\ell,m}\right).\end{aligned}$$

This proves (13.168.5).

[1140] *Proof of (13.168.9):* Let $\sigma\in\operatorname{Sh}_{\ell,m}$. Set $f=\Phi\left(\sigma^{-1}\right)$. Then, f is a bijective map from D to R (because the domain of Φ is (the set of all bijective maps from D to R)).

By the definition of $\operatorname{wt}(f)$, we have $\operatorname{wt}(f)=(\operatorname{wt}_1(f),\operatorname{wt}_2(f),\ldots,\operatorname{wt}_{\ell+m}(f))$, where we set $\operatorname{wt}_s(f):=\sum_{i_u\in f^{-1}(k_s)}\alpha_u+\sum_{j_v\in f^{-1}(k_s)}\beta_v$ for every $s\in\{1,2,\ldots,\ell+m\}$.

On the other hand, let $(\gamma_1,\gamma_2,\ldots,\gamma_{\ell+m})$ be the concatenation $\alpha\cdot\beta=(\alpha_1,\alpha_2,\ldots,\alpha_\ell,\beta_1,\beta_2,\ldots,\beta_m)$. Then, $\alpha\underset{\sigma}{\sqcup\!\sqcup}\beta=\left(\gamma_{\sigma(1)},\gamma_{\sigma(2)},\ldots,\gamma_{\sigma(\ell+m)}\right)$.

Let $s\in\{1,2,\ldots,\ell+m\}$. We are going to prove that $\gamma_{\sigma(s)}=\operatorname{wt}_s(f)$.

We must be in one of the following two cases:

strictly order-preserving. Hence,

$$\begin{aligned}
&\sum_{f \text{ is an } (\ell+m)\text{-shuffling map}} M_{\operatorname{wt}(f)} \\
&= \sum_{\substack{f \text{ is a bijective map from } D \text{ to } R;\\ f \text{ is strictly order-preserving}}} M_{\operatorname{wt}(f)} = \sum_{\substack{\sigma\in\mathfrak{S}_{\ell+m};\\ \Phi(\sigma) \text{ is strictly order-preserving}}} M_{\operatorname{wt}(\Phi(\sigma))} \\
&\qquad \left(\begin{array}{c}\text{here, we have substituted } \Phi(\sigma) \text{ for } f \text{ in the sum,}\\ \text{since } \Phi : \mathfrak{S}_{\ell+m} \to (\text{the set of all bijective maps from } D \text{ to } R)\\ \text{is a bijection}\end{array}\right) \\
&= \underbrace{\sum_{\substack{\sigma\in\mathfrak{S}_{\ell+m};\\ \Phi\left(\sigma^{-1}\right) \text{ is strictly order-preserving}}}}_{\substack{=\sum_{\substack{\sigma\in\mathfrak{S}_{\ell+m};\\ \sigma\in\operatorname{Sh}_{\ell,m}}} \\ \text{(because } \Phi\left(\sigma^{-1}\right) \text{ is strictly order-preserving if and only if } \sigma\in\operatorname{Sh}_{\ell,m} \\ \text{(according to (13.168.5)))}}} M_{\operatorname{wt}(\Phi(\sigma^{-1}))} \\
&\qquad \left(\begin{array}{c}\text{here, we have substituted } \sigma^{-1} \text{ for } \sigma \text{ in the sum,}\\ \text{since the map } \mathfrak{S}_{\ell+m} \to \mathfrak{S}_{\ell+m},\ \sigma \mapsto \sigma^{-1} \text{ is a bijection}\end{array}\right) \\
&= \underbrace{\sum_{\substack{\sigma\in\mathfrak{S}_{\ell+m};\\ \sigma\in\operatorname{Sh}_{\ell,m}}}}_{=\sum_{\sigma\in\operatorname{Sh}_{\ell,m}}} \underbrace{M_{\operatorname{wt}(\Phi(\sigma^{-1}))}}_{\substack{=M_{\alpha \underset{\sigma}{\sqcup\!\sqcup} \beta} \\ \text{(by (13.168.9))}}} = \sum_{\sigma\in\operatorname{Sh}_{\ell,m}} M_{\alpha \underset{\sigma}{\sqcup\!\sqcup} \beta}.
\end{aligned}$$

This proves (13.168.4). The proof of Proposition 6.4.5 is thus complete. □

Case 1: We have $\sigma(s) \leq \ell$.

Case 2: We have $\sigma(s) > \ell$.

Let us consider Case 1 first. In this case, we have $\sigma(s) \leq \ell$. Thus, $\sigma(s) \in \{1, 2, \ldots, \ell\}$, so that $i_{\sigma(s)}$ is well-defined. We have $\mathbf{d}(\sigma(s)) = i_{\sigma(s)}$ (by the definition of $\mathbf{d}$, since $\sigma(s) \leq \ell$), so that $\mathbf{d}^{-1}\left(i_{\sigma(s)}\right) = \sigma(s)$. Now, $f = \Phi\left(\sigma^{-1}\right) = \mathbf{r} \circ \sigma^{-1} \circ \mathbf{d}^{-1}$ (by the definition of Φ), so that

$$f\left(i_{\sigma(s)}\right) = \left(\mathbf{r} \circ \sigma^{-1} \circ \mathbf{d}^{-1}\right)\left(i_{\sigma(s)}\right) = \mathbf{r}\left(\sigma^{-1}\left(\underbrace{\mathbf{d}^{-1}\left(i_{\sigma(s)}\right)}_{=\sigma(s)}\right)\right) = \mathbf{r}\left(\underbrace{\sigma^{-1}(\sigma(s))}_{=s}\right) = \mathbf{r}(s) = k_s$$

(by the definition of $\mathbf{r}$). Since the map f is a bijection, this yields that the **set** $f^{-1}(k_s)$ equals $\left\{i_{\sigma(s)}\right\}$. Hence, the sum $\sum_{i_u \in f^{-1}(k_s)} \alpha_u$ contains precisely one addend, namely the one for $u = \sigma(s)$; as a consequence, this sum simplifies to $\sum_{i_u \in f^{-1}(k_s)} \alpha_u = \alpha_{\sigma(s)}$. On the other hand, the sum $\sum_{j_v \in f^{-1}(k_s)} \beta_v$ is empty (since the set $f^{-1}(k_s)$ equals $\left\{i_{\sigma(s)}\right\}$, and thus contains no elements of the form j_v), and thus vanishes, i.e., we have $\sum_{j_v \in f^{-1}(k_s)} \beta_v = 0$. Now,

$$\operatorname{wt}_s(f) = \underbrace{\sum_{i_u \in f^{-1}(k_s)} \alpha_u}_{=\alpha_{\sigma(s)}} + \underbrace{\sum_{j_v \in f^{-1}(k_s)} \beta_v}_{=0} = \alpha_{\sigma(s)} = \gamma_{\sigma(s)}$$

(because $\gamma_{\sigma(s)} = \alpha_{\sigma(s)}$ (since $(\gamma_1, \gamma_2, \ldots, \gamma_{\ell+m}) = (\alpha_1, \alpha_2, \ldots, \alpha_\ell, \beta_1, \beta_2, \ldots, \beta_m)$ and $\sigma(s) \leq \ell$)). In other words, $\gamma_{\sigma(s)} = \operatorname{wt}_s(f)$.

We have thus shown that $\gamma_{\sigma(s)} = \operatorname{wt}_s(f)$ holds in Case 1. A similar argument (but relying on $\mathbf{d}(\sigma(s)) = j_{\sigma(s)-\ell}$ instead of $\mathbf{d}(\sigma(s)) = i_{\sigma(s)}$) shows that $\gamma_{\sigma(s)} = \operatorname{wt}_s(f)$ holds in Case 2.

Thus, $\gamma_{\sigma(s)} = \operatorname{wt}_s(f)$ holds in both Cases 1 and 2. Since these two Cases cover all possibilities, this yields that $\gamma_{\sigma(s)} = \operatorname{wt}_s(f)$ always holds.

Hence, $\gamma_{\sigma(s)} = \operatorname{wt}_s(f)$ for every $s \in \{1, 2, \ldots, \ell+m\}$. Thus, $\left(\gamma_{\sigma(1)}, \gamma_{\sigma(2)}, \ldots, \gamma_{\sigma(\ell+m)}\right) = (\operatorname{wt}_1(f), \operatorname{wt}_2(f), \ldots, \operatorname{wt}_{\ell+m}(f))$. Hence,

$$\alpha \underset{\sigma}{\sqcup\!\sqcup} \beta = \left(\gamma_{\sigma(1)}, \gamma_{\sigma(2)}, \ldots, \gamma_{\sigma(\ell+m)}\right) = (\operatorname{wt}_1(f), \operatorname{wt}_2(f), \ldots, \operatorname{wt}_{\ell+m}(f)) = \operatorname{wt}\left(\underbrace{f}_{=\Phi\left(\sigma^{-1}\right)}\right) = \operatorname{wt}\left(\Phi\left(\sigma^{-1}\right)\right).$$

This proves (13.168.9).

13.169. **Solution to Exercise 6.4.8.** *Solution to Exercise 6.4.8.*

Proof of Corollary 6.4.7. Write α and β as $\alpha = (\alpha_1, \alpha_2, \ldots, \alpha_\ell)$ and $\beta = (\beta_1, \beta_2, \ldots, \beta_m)$, respectively; then $\ell(\alpha) = \ell$ and $\ell(\beta) = m$.

Fix three disjoint chain posets $(i_1 < i_2 < \cdots < i_\ell)$, $(j_1 < j_2 < \cdots < j_m)$ and $(k_1 < k_2 < k_3 < \cdots)$. We have

$$\begin{aligned}&\sum_{\substack{p\in\mathbb{N};\\ p\leq \ell+m}} \sum_{f \text{ is a } p\text{-shuffling map}} M_{\operatorname{wt}(f)}\\ &= (\text{a sum of terms of the form } M_\delta \text{ with } \delta \in \mathfrak{A}^* \text{ satisfying } \ell(\delta) \leq \ell(\alpha) + \ell(\beta)) \qquad (13.169.1)\end{aligned}$$

[1141]. Now, (13.168.1) becomes

$$\begin{aligned}M_\alpha M_\beta &= \sum_{\substack{p\in\mathbb{N};\\ p\leq \ell+m}} \sum_{f \text{ is a } p\text{-shuffling map}} M_{\operatorname{wt}(f)}\\ &= (\text{a sum of terms of the form } M_\delta \text{ with } \delta \in \mathfrak{A}^* \text{ satisfying } \ell(\delta) \leq \ell(\alpha) + \ell(\beta))\end{aligned}$$

(by (13.169.1)). This proves Corollary 6.4.7. □

13.170. **Solution to Exercise 6.4.12.** *Solution to Exercise 6.4.12.*

Proof of Lemma 6.4.11. (a) Let $\gamma \in u ⧢ v$ be arbitrary. Then, the multiset of all letters of γ is the disjoint union of the multiset of all letters of u with the multiset of all letters of v. Hence, the sum of all letters of γ equals the sum of all letters of u plus the sum of all letters of v. In other words, $|\gamma| = |u| + |v|$ (because $|\gamma|$ is the sum of all letters of γ, because $|u|$ is the sum of all letters of u, and because $|v|$ is the sum of all letters of v). Since $u \in \operatorname{Comp}_n$, we have $|u| = n$. Similarly, $|v| = m$. Thus, $|\gamma| = \underbrace{|u|}_{=n} + \underbrace{|v|}_{=m} = n + m$, so that $\gamma \in \operatorname{Comp}_{n+m}$.

Now, let us forget that we fixed γ. We thus have proven that

$$\gamma \in \operatorname{Comp}_{n+m} \text{ for every } \gamma \in u ⧢ v. \qquad (13.170.1)$$

Applying (13.170.1) to $\gamma = z$, we obtain $z \in \operatorname{Comp}_{n+m}$. This proves Lemma 6.4.11(a).

(b) Since $z \in u ⧢ v$, we have $\ell(z) = \ell(u) + \ell(v)$.

We have $u \in \operatorname{Comp}_n \subset \operatorname{Comp} = \mathfrak{A}^*$ and similarly $v \in \mathfrak{A}^*$. Thus, Proposition 6.4.5 (applied to $\alpha = u$ and $\beta = v$) yields

$$\begin{aligned}&M_u M_v\\ &= \sum_{\gamma \in u ⧢ v} M_\gamma + (\text{a sum of terms of the form } M_\delta \text{ with } \delta \in \mathfrak{A}^* \text{ satisfying } \ell(\delta) < \ell(u) + \ell(v)),\end{aligned}$$

so that

$$\begin{aligned}&M_u M_v - \sum_{\gamma \in u ⧢ v} M_\gamma\\ &= \left(\text{a sum of terms of the form } M_\delta \text{ with } \delta \in \underbrace{\mathfrak{A}^*}_{=\operatorname{Comp}} \text{ satisfying } \ell(\delta) < \underbrace{\ell(u) + \ell(v)}_{=\ell(z)}\right)\\ &= (\text{a sum of terms of the form } M_\delta \text{ with } \delta \in \operatorname{Comp} \text{ satisfying } \ell(\delta) < \ell(z)). \qquad (13.170.2)\end{aligned}$$

[1141] *Proof of (13.169.1):* The proof of this is analogous to the proof of (13.168.3), with the only difference that some $<$ signs are replaced by $\leq$ signs.

Now, let π denote the projection from the direct sum $\operatorname{QSym} = \bigoplus_{k\in\mathbb{N}} \operatorname{QSym}_k$ onto its $(n+m)$-th homogeneous component $\operatorname{QSym}_{n+m}$. Notice that $\underbrace{M_u}_{\substack{\in \operatorname{QSym}_n \\ (\text{since } u \in \operatorname{Comp}_n)}} \underbrace{M_v}_{\substack{\in \operatorname{QSym}_m \\ (\text{since } v \in \operatorname{Comp}_m)}} \in \operatorname{QSym}_n \cdot \operatorname{QSym}_m \subset \operatorname{QSym}_{n+m}$, so that $\pi\left(M_u M_v\right) = M_u M_v$. Also, for every $\gamma \in u \sqcup v$, we have $M_\gamma \in \operatorname{QSym}_{n+m}$ (because (13.170.1) shows that $\gamma \in \operatorname{Comp}_{n+m}$) and therefore $\pi\left(M_\gamma\right) = M_\gamma$. Hence, the $\mathbf{k}$-linearity of π yields

$$\begin{aligned}
\pi\left(M_u M_v - \sum_{\gamma \in u \sqcup v} M_\gamma\right) &= \underbrace{\pi\left(M_u M_v\right)}_{= M_u M_v} - \sum_{\gamma \in u \sqcup v} \underbrace{\pi\left(M_\gamma\right)}_{= M_\gamma} \\
&= M_u M_v - \sum_{\gamma \in u \sqcup v} M_\gamma . \qquad (13.170.3)
\end{aligned}$$

On the other hand,

$$\pi\left(M_\delta\right) = 0 \qquad \text{for every } \delta \in \operatorname{Comp} \setminus \operatorname{Comp}_{n+m} \qquad (13.170.4)$$

[1142].

But applying the projection π to the equality (13.170.2), we obtain

$$\begin{aligned}
&\pi\left(M_u M_v - \sum_{\gamma \in u \sqcup v} M_\gamma\right) \\
&= \pi\left(\text{a sum of terms of the form } M_\delta \text{ with } \delta \in \operatorname{Comp} \text{ satisfying } \ell\left(\delta\right) < \ell\left(z\right)\right) \\
&= \left(\text{a sum of terms of the form } \pi\left(M_\delta\right) \text{ with } \delta \in \operatorname{Comp} \text{ satisfying } \ell\left(\delta\right) < \ell\left(z\right)\right) \\
&= \left(\text{a sum of terms of the form } \underbrace{\pi\left(M_\delta\right)}_{\substack{= M_\delta \\ (\text{since } M_\delta \in \operatorname{QSym}_{n+m} \\ (\text{since } \delta \in \operatorname{Comp}_{n+m}))}} \text{ with } \delta \in \operatorname{Comp}_{n+m} \text{ satisfying } \ell\left(\delta\right) < \ell\left(z\right)\right) \\
&\qquad + \left(\text{a sum of terms of the form } \underbrace{\pi\left(M_\delta\right)}_{\substack{= 0 \\ (\text{by } (13.170.4))}} \text{ with } \delta \in \operatorname{Comp} \setminus \operatorname{Comp}_{n+m} \text{ satisfying } \ell\left(\delta\right) < \ell\left(z\right)\right) \\
&\qquad \left(\text{since every } \delta \in \operatorname{Comp} \text{ satisfies either } \delta \in \operatorname{Comp}_{n+m} \text{ or } \delta \in \operatorname{Comp} \setminus \operatorname{Comp}_{n+m}\right) \\
&= \left(\text{a sum of terms of the form } M_\delta \text{ with } \delta \in \operatorname{Comp}_{n+m} \text{ satisfying } \ell\left(\delta\right) < \ell\left(z\right)\right) \\
&\qquad + \underbrace{\left(\text{a sum of terms of the form } 0 \text{ with } \delta \in \operatorname{Comp} \setminus \operatorname{Comp}_{n+m} \text{ satisfying } \ell\left(\delta\right) < \ell\left(z\right)\right)}_{=0} \\
&= \left(\text{a sum of terms of the form } M_\delta \text{ with } \delta \in \operatorname{Comp}_{n+m} \text{ satisfying } \ell\left(\delta\right) < \ell\left(z\right)\right) \\
&= \left(\text{a sum of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_{n+m} \text{ satisfying } \ell\left(w\right) < \ell\left(z\right)\right) \\
&\qquad \left(\text{here, we renamed the index } \delta \text{ as } w\right) \\
&= \left(\text{a sum of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_{n+m} \text{ satisfying } w \underset{\text{wll}}{<} z\right)
\end{aligned}$$

[1142] *Proof of (13.170.4):* Let $\delta \in \operatorname{Comp} \setminus \operatorname{Comp}_{n+m}$. Then, $\delta \in \operatorname{Comp}$ but $\delta \notin \operatorname{Comp}_{n+m}$. In other words, δ is a composition with size $\left|\delta\right| \neq n+m$. As a consequence, M_δ is a homogeneous element of QSym of degree $\left|\delta\right| \neq n+m$. Therefore, $\pi\left(M_\delta\right) = 0$ (since π is the projection from the direct sum $\operatorname{QSym} = \bigoplus_{k\in\mathbb{N}} \operatorname{QSym}_k$ onto its $(n+m)$-th homogeneous component $\operatorname{QSym}_{n+m}$). This proves (13.170.4).

(since every $w \in \operatorname{Comp}_{n+m}$ satisfying $\ell(w) < \ell(z)$ must satisfy $w \underset{\text{wll}}{<} z$). Compared with (13.170.3), this yields

$$M_u M_v - \sum_{\gamma \in u \sqcup v} M_\gamma$$
$$= \left(\text{a sum of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_{n+m} \text{ satisfying } w \underset{\text{wll}}{<} z\right).$$

Adding $\sum_{\gamma \in u \sqcup v} M_\gamma$ to both sides of this equality, we obtain

$$M_u M_v = \sum_{\gamma \in u \sqcup v} M_\gamma + \left(\text{a sum of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_{n+m} \text{ satisfying } w \underset{\text{wll}}{<} z\right). \tag{13.170.5}$$

But every $\gamma \in u \sqcup v$ satisfying $\gamma \neq z$ must satisfy $\gamma \in \operatorname{Comp}_{n+m}$ (by (13.170.1)) and $\gamma \underset{\text{wll}}{<} z$ [1143]. Hence,

$$\sum_{\substack{\gamma \in u \sqcup v;\\ \gamma \neq z}} M_\gamma = \left(\text{a sum of terms of the form } M_\gamma \text{ with } \gamma \in \operatorname{Comp}_{n+m} \text{ satisfying } \gamma \underset{\text{wll}}{<} z\right). \tag{13.170.6}$$

But let h be the multiplicity with which the word z appears in the multiset $u \sqcup v$. Then, h is a positive integer (since z is an element of the multiset $u \sqcup v$), and satisfies $\sum_{\substack{\gamma \in u \sqcup v;\\ \gamma = z}} M_z = h M_z$. Now,

$$\sum_{\gamma \in u \sqcup v} M_\gamma = \sum_{\substack{\gamma \in u \sqcup v;\\ \gamma = z}} \underbrace{M_\gamma}_{\substack{= M_z \\ (\text{since } \gamma = z)}} + \sum_{\substack{\gamma \in u \sqcup v;\\ \gamma \neq z}} M_\gamma$$
$$= \underbrace{\sum_{\substack{\gamma \in u \sqcup v;\\ \gamma = z}} M_z}_{= h M_z} + \underbrace{\sum_{\substack{\gamma \in u \sqcup v;\\ \gamma \neq z}} M_\gamma}_{\substack{= \left(\text{a sum of terms of the form } M_\gamma \text{ with } \gamma \in \operatorname{Comp}_{n+m} \text{ satisfying } \gamma \underset{\text{wll}}{<} z\right) \\ (\text{by (13.170.6)})}}$$
$$= h M_z + \underbrace{\left(\text{a sum of terms of the form } M_\gamma \text{ with } \gamma \in \operatorname{Comp}_{n+m} \text{ satisfying } \gamma \underset{\text{wll}}{<} z\right)}_{\substack{= \left(\text{a sum of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_{n+m} \text{ satisfying } w \underset{\text{wll}}{<} z\right) \\ (\text{here, we have renamed the index } \gamma \text{ as } w)}}$$
$$= h M_z + \left(\text{a sum of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_{n+m} \text{ satisfying } w \underset{\text{wll}}{<} z\right).$$

[1143] *Proof.* Let $\gamma \in u \sqcup v$ be such that $\gamma \neq z$. Since $\gamma \in u \sqcup v$, we must have $\ell(\gamma) = \ell(u) + \ell(v) = \ell(z)$. Also, γ and z both belong to $\operatorname{Comp}_{n+m}$. Now, γ is an element of the multiset $u \sqcup v$, whereas z is the lexicographically highest element of this multiset. Hence, $\gamma \leq z$ with respect to the lexicographic order. Since the elements γ and z of $\operatorname{Comp}_{n+m}$ satisfy $\ell(\gamma) = \ell(z)$ and $\gamma \leq z$ with respect to the lexicographic order, we must have $\gamma \underset{\text{wll}}{\leq} z$, and thus $\gamma \underset{\text{wll}}{<} z$ (since $\gamma \neq z$), qed.

Hence, (13.170.5) becomes

$$\begin{aligned}
&M_u M_v \\
&= \underbrace{\sum_{\gamma \in u \shuffle v} M_\gamma}_{= hM_z + \left(\text{a sum of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_{n+m} \text{ satisfying } w \underset{\text{wll}}{<} z\right)} \\
&\qquad + \left(\text{a sum of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_{n+m} \text{ satisfying } w \underset{\text{wll}}{<} z\right) \\
&= hM_z + \left(\text{a sum of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_{n+m} \text{ satisfying } w \underset{\text{wll}}{<} z\right) \\
&\qquad + \left(\text{a sum of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_{n+m} \text{ satisfying } w \underset{\text{wll}}{<} z\right) \\
&= hM_z + \left(\text{a sum of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_{n+m} \text{ satisfying } w \underset{\text{wll}}{<} z\right).
\end{aligned}$$

This proves Lemma 6.4.11(b).

(c) Since $z \in u \shuffle v$, we have $\ell(z) = \ell(u) + \ell(v)$. Since $v' \underset{\text{wll}}{<} v$, we have $v' \neq v$.

Let z' be the lexicographically highest element of the multiset $u \shuffle v'$. Lemma 6.4.11(a) (applied to v' and z' instead of v and z) yields $z' \in \operatorname{Comp}_{n+m}$. Since z' is an element of the multiset $u \shuffle v'$, we have $\ell(z') = \ell(u) + \ell(v')$.

Now, it is easy to see (using Lemma 6.3.10) that $z' \underset{\text{wll}}{<} z$ [1144]. Hence, every $w \in \operatorname{Comp}_{n+m}$ satisfying $w \underset{\text{wll}}{<} z'$ also satisfies $w \underset{\text{wll}}{<} z$ (because it satisfies $w \underset{\text{wll}}{<} z' \underset{\text{wll}}{<} z$). Applying Lemma 6.4.11(b) to v' and z' instead of v and z, we conclude that there exists a positive integer h such that

$$M_u M_{v'} = hM_{z'} + \left(\text{a sum of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_{n+m} \text{ satisfying } w \underset{\text{wll}}{<} z'\right).$$

[1144] *Proof.* We have $v' \underset{\text{wll}}{<} v$, thus $v' \underset{\text{wll}}{\leq} v$. According to the definition of the relation $\underset{\text{wll}}{\leq}$, this means that we are in one of the following two cases:

Case 1: We have $\ell(v') < \ell(v)$.

Case 2: We have $\ell(v') = \ell(v)$ and $v' \leq v$ in lexicographic order.

Let us first consider Case 1. In this case, we have $\ell(v') < \ell(v)$. Now, $\ell(z') = \ell(u) + \underbrace{\ell(v')}_{<\ell(v)} < \ell(u) + \ell(v) = \ell(z)$. But any two elements α and β of $\operatorname{Comp}_{n+m}$ satisfying $\ell(\alpha) < \ell(\beta)$ must satisfy $\alpha \underset{\text{wll}}{\leq} \beta$ (by the definition of $\underset{\text{wll}}{\leq}$). Applying this to $\alpha = z'$ and $\beta = z$, we obtain $z' \underset{\text{wll}}{\leq} z$. Combined with $z' \neq z$ (since $\ell(z') < \ell(z)$), this yields $z' \underset{\text{wll}}{<} z$. Thus, $z' \underset{\text{wll}}{<} z$ is proven in Case 1.

Let us now consider Case 2. In this case, we have $\ell(v') = \ell(v)$ and $v' \leq v$ in lexicographic order. Now, $\ell(z') = \ell(u) + \underbrace{\ell(v')}_{=\ell(v)} = \ell(u) + \ell(v) = \ell(z)$.

We know that z' is an element of the multiset $u \shuffle v'$; in other words, z' can be written in the form $z' = u \underset{\sigma}{\shuffle} v'$ for some $\sigma \in \operatorname{Sh}_{\ell(u),\ell(v')}$ (because every element of the multiset $u \shuffle v'$ can be written in this form). Consider this σ. We have $\sigma \in \operatorname{Sh}_{\ell(u),\ell(v')} = \operatorname{Sh}_{\ell(u),\ell(v)}$ (since $\ell(v') = \ell(v)$), and thus $u \underset{\sigma}{\shuffle} v$ is a well-defined element of the multiset $u \shuffle v$. Therefore, $u \underset{\sigma}{\shuffle} v \leq z$ (because z is the lexicographically highest element of this multiset $u \shuffle v$).

But we have $v' \leq v$ with respect to the relation $\leq$ on $\mathfrak{A}^*$ defined in Definition 6.1.1 (since $v' \leq v$ in lexicographic order). Thus, $v' < v$ with respect to this relation (since $v' \neq v$). Hence, Lemma 6.3.10(a) (applied to $\ell(u)$ and $\ell(v)$ instead of n and m) yields $u \underset{\sigma}{\shuffle} v' < u \underset{\sigma}{\shuffle} v \leq z$. Thus, $z' = u \underset{\sigma}{\shuffle} v' < z$ with respect to the relation $\leq$ on $\mathfrak{A}^*$. In other words, $z' < z$ in lexicographic order (since $\ell(z') = \ell(z)$), thus $z' \leq z$.

Now, the two elements z' and z of $\operatorname{Comp}_{n+m}$ satisfy $\ell(z') = \ell(z)$ and $z' \leq z$ in lexicographic order. But any two elements α and β of $\operatorname{Comp}_{n+m}$ satisfying ($\ell(\alpha) = \ell(\beta)$ and $\alpha \leq \beta$ in lexicographic order) must satisfy $\alpha \underset{\text{wll}}{\leq} \beta$ (by the definition of $\underset{\text{wll}}{\leq}$). Applying this to $\alpha = z'$ and $\beta = z$, we obtain $z' \underset{\text{wll}}{\leq} z$. Since $z' \neq z$, this yields $z' \underset{\text{wll}}{<} z$. Hence, $z' \underset{\text{wll}}{<} z$ is proven in Case 2.

Now, we have proved $z' \underset{\text{wll}}{<} z$ in each of the two Cases 1 and 2. Since these two Cases cover all possibilities, this yields that $z' \underset{\text{wll}}{<} z$ always holds, qed.

Consider this h. We have

$$\begin{aligned}
M_u M_{v'} &= \underbrace{h M_{z'}}_{\substack{= \sum_{i=1}^{h} M_{z'} = \left(\text{a sum of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_{n+m} \text{ satisfying } w \underset{\text{wll}}{<} z\right) \\ \left(\text{since } z' \in \operatorname{Comp}_{n+m} \text{ satisfies } z' \underset{\text{wll}}{<} z\right)}} \\
&\qquad + \underbrace{\left(\text{a sum of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_{n+m} \text{ satisfying } w \underset{\text{wll}}{<} z'\right)}_{\substack{= \left(\text{a sum of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_{n+m} \text{ satisfying } w \underset{\text{wll}}{<} z\right) \\ \left(\text{since every } w \in \operatorname{Comp}_{n+m} \text{ satisfying } w \underset{\text{wll}}{<} z' \text{ also satisfies } w \underset{\text{wll}}{<} z\right)}} \\
&= \left(\text{a sum of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_{n+m} \text{ satisfying } w \underset{\text{wll}}{<} z\right) \\
&\qquad + \left(\text{a sum of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_{n+m} \text{ satisfying } w \underset{\text{wll}}{<} z\right) \\
&= \left(\text{a sum of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_{n+m} \text{ satisfying } w \underset{\text{wll}}{<} z\right).
\end{aligned}$$

This proves Lemma 6.4.11(c). □

13.171. **Solution to Exercise 6.4.13.** *Solution to Exercise 6.4.13.*

Proof of Proposition 6.4.10. We shall prove Proposition 6.4.10 by strong induction over n. So we fix some $N \in \mathbb{N}$, and we assume that Proposition 6.4.10 holds whenever $n < N$. We now need to prove that Proposition 6.4.10 holds for $n = N$. In other words, we need to prove that for every $x \in \operatorname{Comp}_N$, there is a family $(\eta_{x,y})_{y \in \operatorname{Comp}_N} \in \mathbb{N}^{\operatorname{Comp}_N}$ of elements of $\mathbb{N}$ satisfying

$$\mathbf{M}_x = \sum_{\substack{y \in \operatorname{Comp}_N; \\ y \underset{\text{wll}}{\leq} x}} \eta_{x,y} M_y \tag{13.171.1}$$

and $\eta_{x,x} \neq 0$ (in $\mathbb{N}$).

Let $x \in \operatorname{Comp}_N$ be arbitrary. We need to prove that there is a family $(\eta_{x,y})_{y \in \operatorname{Comp}_N} \in \mathbb{N}^{\operatorname{Comp}_N}$ of elements of $\mathbb{N}$ satisfying (13.171.1) and $\eta_{x,x} \neq 0$.

Let $(a_1, a_2, \ldots, a_p)$ be the CFL factorization of x. Then, a_1, a_2, $\ldots$, a_p are Lyndon words satisfying $x = a_1 a_2 \cdots a_p$ and $a_1 \geq a_2 \geq \cdots \geq a_p$.

If x is the empty word, then our claim is trivial (in fact, we can just set $\eta_{x,x} = 1$ in this case, and (13.171.1) holds obviously). Hence, for the rest of this proof, we WLOG assume that x is not the empty word. Thus, $p \neq 0$ (because otherwise, $x = a_1 a_2 \cdots a_p$ would be an empty product and thus the empty word, contradicting the assumption that x is not the empty word). Hence, we can define two words $u \in \mathfrak{A}^*$ and $v \in \mathfrak{A}^*$ by $u = a_1$ and $v = a_2 a_3 \cdots a_p$. The word u is Lyndon (since $u = a_1$ and since a_1 is Lyndon), and thus has (u) as its CFL factorization. The CFL factorization of the word v is $(a_2, a_3, \ldots, a_p)$ (since the words a_2, a_3, $\ldots$, a_p are Lyndon and satisfy $v = a_2 a_3 \cdots a_p$ and $a_2 \geq a_3 \geq \cdots \geq a_p$ (because $a_1 \geq a_2 \geq \cdots \geq a_p$)). Also, $u = a_1 \geq a_{j+1}$ for every $i \in \{1, 2, \ldots, 1\}$ and $j \in \{1, 2, \ldots, p-1\}$ (because $a_1 \geq a_2 \geq \cdots \geq a_p$). Hence, we can apply Theorem 6.2.2(c) to 1, (u), $p-1$ and $(a_2, a_3, \ldots, a_p)$ instead of p, $(a_1, a_2, \ldots, a_p)$, q and $(b_1, b_2, \ldots, b_q)$. As a result, we conclude that the lexicographically highest element of the multiset $u \sqcup v$ is $\underbrace{u}_{=a_1} \underbrace{v}_{=a_2 a_3 \cdots a_p} = a_1 (a_2 a_3 \cdots a_p) = a_1 a_2 \cdots a_p = x$.

But $\mathbf{M}_u = M_u$ (by the definition of $\mathbf{M}_u$, since u has CFL factorization (u)), and $\mathbf{M}_x = \mathbf{M}_u \mathbf{M}_v$ [1145].

The word u is Lyndon and thus nonempty, so that $|u| > 0$. Now, $\left| \underbrace{x}_{=uv} \right| = |uv| = |u| + |v|$, so that $|u| + |v| = |x| = N$ (since $x \in \operatorname{Comp}_N$). Thus, $N = \underbrace{|u|}_{>0} + |v| > |v|$, so that $|v| < N$. Hence, the induction hypothesis tells us that we can apply Proposition 6.4.10 to $|v|$ and v instead of n and x (since $v \in \operatorname{Comp}_{|v|}$). As a result, we see that there is a family $(\eta_{v,y})_{y \in \operatorname{Comp}_{|v|}} \in \mathbb{N}^{\operatorname{Comp}_{|v|}}$ of elements of $\mathbb{N}$ satisfying

$$\mathbf{M}_v = \sum_{\substack{y \in \operatorname{Comp}_{|v|}; \\ y \underset{\mathrm{wll}}{\leq} v}} \eta_{v,y} M_y$$

and $\eta_{v,v} \neq 0$ (in $\mathbb{N}$). Consider this family $(\eta_{v,y})_{y \in \operatorname{Comp}_{|v|}}$.

We have $u \in \operatorname{Comp}_{|u|}$ and $v \in \operatorname{Comp}_{|v|}$. Hence, Lemma 6.4.11(b) (applied to x, $|u|$ and $|v|$ instead of z, u and v) yields that there exists a positive integer h such that

$$\begin{aligned} M_u M_v &= h M_x + \left(\text{a sum of terms of the form } M_w \text{ with } w \in \underbrace{\operatorname{Comp}_{|u|+|v|}}_{\substack{=\operatorname{Comp}_N \\ (\text{since } |u|+|v|=N)}} \text{ satisfying } w \underset{\mathrm{wll}}{<} x \right) \\ &= h M_x + \left(\text{a sum of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_N \text{ satisfying } w \underset{\mathrm{wll}}{<} x \right). \qquad (13.171.2) \end{aligned}$$

Consider this h. Then, $h \in \mathbb{N}$ and $h \neq 0$ (since h is a positive integer).

[1145] *Proof.* Since the CFL factorization of v is $(a_2, a_3, \ldots, a_p)$, we have $\mathbf{M}_v = M_{a_2} M_{a_3} \cdots M_{a_p}$ (by the definition of $\mathbf{M}_v$). But since the CFL factorization of x is $(a_1, a_2, \ldots, a_p)$, we have

$$\mathbf{M}_x = M_{a_1} M_{a_2} \cdots M_{a_p} = \underbrace{M_{a_1}}_{\substack{=M_u \\ (\text{since } a_1 = u)}} \underbrace{\left(M_{a_2} M_{a_3} \cdots M_{a_p} \right)}_{=\mathbf{M}_v} = \underbrace{M_u}_{\substack{=\mathbf{M}_u \\ (\text{since } \mathbf{M}_u = M_u)}} \mathbf{M}_v = \mathbf{M}_u \mathbf{M}_v,$$

qed.

Now,

$$\begin{aligned}
\mathbf{M}_x &= \underbrace{\mathbf{M}_u}_{=M_u} \underbrace{\mathbf{M}_v}_{=\sum\limits_{\substack{y\in\operatorname{Comp}_{|v|};\\ y \underset{\mathrm{wll}}{\leq} v}} \eta_{v,y} M_y} = M_u \left(\sum_{\substack{y\in\operatorname{Comp}_{|v|};\\ y \underset{\mathrm{wll}}{\leq} v}} \eta_{v,y} M_y \right) = \sum_{\substack{y\in\operatorname{Comp}_{|v|};\\ y \underset{\mathrm{wll}}{\leq} v}} \eta_{v,y} M_u M_y \\
&= \eta_{v,v} \underbrace{M_u M_v}_{\substack{=hM_x + \left(\text{a sum of terms of the form } M_w \text{ with } w\in\operatorname{Comp}_N \text{ satisfying } w \underset{\mathrm{wll}}{<} x\right) \\ \text{(by (13.171.2))}}} \\
&\qquad + \sum_{\substack{y\in\operatorname{Comp}_{|v|};\\ y \underset{\mathrm{wll}}{<} v}} \eta_{v,y} \underbrace{M_u M_y}_{\substack{=\left(\text{a sum of terms of the form } M_w \text{ with } w\in\operatorname{Comp}_{|u|+|v|} \text{ satisfying } w \underset{\mathrm{wll}}{<} x\right) \\ \text{(by Lemma 6.4.11(c), applied to } n=|u|,\ m=|v|,\ v'=y \text{ and } z=x\text{)}}} \\
&\qquad\qquad \text{(here, we have split off the addend for } y = v \text{ from the sum)} \\
&= \underbrace{\eta_{v,v} \left(hM_x + \left(\text{a sum of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_N \text{ satisfying } w \underset{\mathrm{wll}}{<} x \right) \right)}_{=\eta_{v,v} hM_x + \eta_{v,v} \left(\text{a sum of terms of the form } M_w \text{ with } w\in\operatorname{Comp}_N \text{ satisfying } w \underset{\mathrm{wll}}{<} x\right)} \\
&\qquad + \sum_{\substack{y\in\operatorname{Comp}_{|v|};\\ y \underset{\mathrm{wll}}{<} v}} \eta_{v,y} \left(\text{a sum of terms of the form } M_w \text{ with } w \in \underbrace{\operatorname{Comp}_{|u|+|v|}}_{\substack{=\operatorname{Comp}_N \\ \text{(since } |u|+|v|=N\text{)}}} \text{ satisfying } w \underset{\mathrm{wll}}{<} x \right) \\
&= \eta_{v,v} hM_x + \eta_{v,v} \left(\text{a sum of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_N \text{ satisfying } w \underset{\mathrm{wll}}{<} x \right) \\
&\qquad \underbrace{+ \sum_{\substack{y\in\operatorname{Comp}_{|v|};\\ y \underset{\mathrm{wll}}{<} v}} \eta_{v,y} \left(\text{a sum of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_N \text{ satisfying } w \underset{\mathrm{wll}}{<} x \right)}_{\substack{=\left(\text{an } \mathbb{N}\text{-linear combination of terms of the form } M_w \text{ with } w\in\operatorname{Comp}_N \text{ satisfying } w \underset{\mathrm{wll}}{<} x\right) \\ \text{(since } \eta_{v,y}\in\mathbb{N} \text{ for every } y\in\operatorname{Comp}_{|v|} \text{ satisfying } y \underset{\mathrm{wll}}{<} v\text{)}}} \\
&= \eta_{v,v} hM_x + \underbrace{\eta_{v,v} \left(\text{a sum of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_N \text{ satisfying } w \underset{\mathrm{wll}}{<} x \right)}_{\substack{=\left(\text{an } \mathbb{N}\text{-linear combination of terms of the form } M_w \text{ with } w\in\operatorname{Comp}_N \text{ satisfying } w \underset{\mathrm{wll}}{<} x\right) \\ \text{(since } \eta_{v,v}\in\mathbb{N}\text{)}}} \\
&\qquad + \left(\text{an } \mathbb{N}\text{-linear combination of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_N \text{ satisfying } w \underset{\mathrm{wll}}{<} x \right) \\
&= \eta_{v,v} hM_x + \left(\text{an } \mathbb{N}\text{-linear combination of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_N \text{ satisfying } w \underset{\mathrm{wll}}{<} x \right) \\
&\qquad + \left(\text{an } \mathbb{N}\text{-linear combination of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_N \text{ satisfying } w \underset{\mathrm{wll}}{<} x \right) \\
&= \eta_{v,v} hM_x + \left(\text{an } \mathbb{N}\text{-linear combination of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_N \text{ satisfying } w \underset{\mathrm{wll}}{<} x \right).
\end{aligned}$$

In other words, we can write $\mathbf{M}_x$ in the form

$$\mathbf{M}_x = \eta_{v,v} hM_x + \mathbf{c}, \tag{13.171.3}$$

where $\mathbf{c}$ is an $\mathbb{N}$-linear combination of terms of the form M_w with $w \in \operatorname{Comp}_N$ satisfying $w \underset{\text{wll}}{<} x$. Consider this $\mathbf{c}$.

Write $\mathbf{c}$ in the form

$$\mathbf{c} = \sum_{\substack{y \in \operatorname{Comp}_N; \\ y \underset{\text{wll}}{<} x}} \eta_{x,y} M_y, \tag{13.171.4}$$

where $\eta_{x,y}$ is an element of $\mathbb{N}$ for every $y \in \operatorname{Comp}_N$ satisfying $y \underset{\text{wll}}{<} x$. (This is possible since $\mathbf{c}$ is an $\mathbb{N}$-linear combination of terms of the form M_w with $w \in \operatorname{Comp}_N$ satisfying $w \underset{\text{wll}}{<} x$.) Thus, we have defined a family $(\eta_{x,y})_{y \in \operatorname{Comp}_N;\ y \underset{\text{wll}}{<} x}$ of elements of $\mathbb{N}$. Extend this family to a family $(\eta_{x,y})_{y \in \operatorname{Comp}_N} \in \mathbb{N}^{\operatorname{Comp}_N}$ of elements of $\mathbb{N}$ by defining

$$\eta_{x,y} = \delta_{x,y} \eta_{v,v} h \qquad \text{for every } y \in \operatorname{Comp}_N \text{ which does not satisfy } y \underset{\text{wll}}{<} x.$$

Notice that the definition of $\eta_{x,x}$ yields $\eta_{x,x} = \delta_{x,x} \eta_{v,v} h$ (since x does not satisfy $x \underset{\text{wll}}{<} x$), and thus $\eta_{x,x} = \underbrace{\delta_{x,x}}_{=1} \eta_{v,v} h = \underbrace{\eta_{v,v}}_{\neq 0} \underbrace{h}_{\neq 0} \neq 0$.

Now,

$$\begin{aligned} \sum_{\substack{y \in \operatorname{Comp}_N; \\ y \underset{\text{wll}}{\leq} x}} \eta_{x,y} M_y &= \underbrace{\eta_{x,x}}_{= \eta_{v,v} h} M_x + \underbrace{\sum_{\substack{y \in \operatorname{Comp}_N; \\ y \underset{\text{wll}}{<} x}} \eta_{x,y} M_y}_{\substack{= \mathbf{c} \\ \text{(by (13.171.4))}}} \\ &\qquad \text{(here, we have split off the addend for } y = x \text{ from the sum)} \\ &= \eta_{v,v} h M_x + \mathbf{c} = \mathbf{M}_x \qquad \text{(by (13.171.3))}, \end{aligned}$$

and thus $\mathbf{M}_x = \sum_{\substack{y \in \operatorname{Comp}_N; \\ y \underset{\text{wll}}{\leq} x}} \eta_{x,y} M_y$. In other words, (13.171.1) is satisfied.

Hence, we have constructed a family $(\eta_{x,y})_{y \in \operatorname{Comp}_N} \in \mathbb{N}^{\operatorname{Comp}_N}$ of elements of $\mathbb{N}$ satisfying (13.171.1) and $\eta_{x,x} \neq 0$. Thus, we have shown the existence of such a family. The induction step is thus complete, and Proposition 6.4.10 is proven by induction. □

13.172. **Solution to Exercise 6.4.15.** *Solution to Exercise 6.4.15.*

Proof of Proposition 6.4.14. We know that $\mathbb{Q}$ is a subring of $\mathbf{k}$. Hence, every nonzero element of $\mathbb{N}$ is an invertible element of $\mathbf{k}$.

For every composition $u \in \operatorname{Comp} = \mathfrak{A}^*$, define an element $\mathbf{M}_u \in \operatorname{QSym}$ by $\mathbf{M}_u = M_{a_1} M_{a_2} \cdots M_{a_p}$, where $(a_1, a_2, \ldots, a_p)$ is the CFL factorization of the word u.

Fix $n \in \mathbb{N}$. Consider the set Comp_n as a poset whose smaller relation is the relation $\underset{\text{wll}}{\leq}$. We shall use the notations introduced in Section 11.1.

It is easy to see that $(M_u)_{u \in \operatorname{Comp}_n}$ is a basis of the $\mathbf{k}$-module QSym_n. According to Proposition 6.4.10, the family $(\mathbf{M}_u)_{u \in \operatorname{Comp}_n}$ expands invertibly triangularly in the basis $(M_u)_{u \in \operatorname{Comp}_n}$ [1146]. Hence, Corollary 11.1.19(e) (applied to QSym_n, Comp_n, $(\mathbf{M}_u)_{u \in \operatorname{Comp}_n}$ and $(M_u)_{u \in \operatorname{Comp}_n}$ instead of M, S, $(e_s)_{s \in S}$ and

[1146] *Proof.* Proposition 6.4.10 shows that, for every $x \in \operatorname{Comp}_n$, there exists a family $(\eta_{x,y})_{y \in \operatorname{Comp}_n} \in \mathbb{N}^{\operatorname{Comp}_n}$ of elements of $\mathbb{N}$ such that

$$\mathbf{M}_x = \sum_{\substack{y \in \operatorname{Comp}_n; \\ y \underset{\text{wll}}{\leq} x}} \eta_{x,y} M_y \tag{13.172.1}$$

and

$$\eta_{x,x} \neq 0 \qquad (\text{in } \mathbb{N}). \tag{13.172.2}$$

$(f_s)_{s\in S}$) yields that the family $(\mathbf{M}_u)_{u\in\operatorname{Comp}_n}$ is a basis of the $\mathbf{k}$-module QSym_n if and only if the family $(M_u)_{u\in\operatorname{Comp}_n}$ is a basis of the $\mathbf{k}$-module QSym_n [1147]. Hence, the family $(\mathbf{M}_u)_{u\in\operatorname{Comp}_n}$ is a basis of the $\mathbf{k}$-module QSym_n (since the family $(M_u)_{u\in\operatorname{Comp}_n}$ is a basis of the $\mathbf{k}$-module QSym_n).

Now, let us forget that we fixed n. We thus have proven that the family $(\mathbf{M}_u)_{u\in\operatorname{Comp}_n}$ is a basis of QSym_n for every $n\in\mathbb{N}$. Hence, the disjoint union of the families $(\mathbf{M}_u)_{u\in\operatorname{Comp}_n}$ over all $n\in\mathbb{N}$ is a basis of the direct sum $\bigoplus_{n\in\mathbb{N}}\operatorname{QSym}_n$. Since the former disjoint union is the family $(\mathbf{M}_u)_{u\in\operatorname{Comp}}$, while the latter direct sum is the $\mathbf{k}$-module $\bigoplus_{n\in\mathbb{N}}\operatorname{QSym}_n=\operatorname{QSym}$, this rewrites as follows: The family $(\mathbf{M}_u)_{u\in\operatorname{Comp}}$ is a basis of the $\mathbf{k}$-module QSym. In other words, the family $(\mathbf{M}_u)_{u\in\mathfrak{A}^*}$ is a basis of the $\mathbf{k}$-module QSym (since $\mathfrak{A}^*=\operatorname{Comp}$).

But Lemma 6.3.7(a) (applied to $A=\operatorname{QSym}$, $b_w=M_w$ and $\mathbf{b}_u=\mathbf{M}_u$) yields that the family $(M_w)_{w\in\mathfrak{L}}$ is an algebraically independent generating set of the $\mathbf{k}$-algebra QSym if and only if the family $(\mathbf{M}_u)_{u\in\mathfrak{A}^*}$ is a basis of the $\mathbf{k}$-module QSym. Hence, the family $(M_w)_{w\in\mathfrak{L}}$ is an algebraically independent generating set of the $\mathbf{k}$-algebra QSym (since we know that the family $(\mathbf{M}_u)_{u\in\mathfrak{A}^*}$ is a basis of the $\mathbf{k}$-module QSym). This proves Proposition 6.4.14. □

13.173. **Solution to Exercise 6.5.4.** *Solution to Exercise 6.5.4.* We first notice that every $s\in\{1,2,3,\ldots\}$ and $\mathbf{i}\in\operatorname{SIS}(\ell)$ satisfy

$$(\mathbf{x}_{\mathbf{i}}^{\alpha})^s=\mathbf{x}_{\mathbf{i}}^{\alpha\{s\}} \tag{13.173.1}$$

[1148].

Consider such a family $(\eta_{x,y})_{y\in\operatorname{Comp}_n}\in\mathbb{N}^{\operatorname{Comp}_n}$ for each $x\in\operatorname{Comp}_n$. Thus, an integer $\eta_{x,y}\in\mathbb{N}\subset\mathbb{Q}\subset\mathbf{k}$ is defined for each $(x,y)\in\operatorname{Comp}_n\times\operatorname{Comp}_n$.

We observe that the only elements $\eta_{s,t}$ (with $(s,t)\in\operatorname{Comp}_n\times\operatorname{Comp}_n$) appearing in the statements (13.172.1) and (13.172.2) are those which satisfy $t\underset{\text{wll}}{\leq}s$. Hence, if some $(s,t)\in\operatorname{Comp}_n\times\operatorname{Comp}_n$ does not satisfy $t\underset{\text{wll}}{\leq}s$, then the corresponding element $\eta_{s,t}$ does not appear in any of the statements (13.172.1) and (13.172.2); as a consequence, we can arbitrarily change the value of this $\eta_{s,t}$ without running the risk of invalidating (13.172.1) and (13.172.2). Hence, we can WLOG assume that

$$\text{every } (s,t)\in\operatorname{Comp}_n\times\operatorname{Comp}_n \text{ which does not satisfy } t\underset{\text{wll}}{\leq}s \text{ must satisfy } \eta_{s,t}=0 \tag{13.172.3}$$

(otherwise, we can just set all such $\eta_{s,t}$ to 0). Assume this. Thus, the matrix $(\eta_{x,y})_{(x,y)\in\operatorname{Comp}_n\times\operatorname{Comp}_n}$ is triangular. The diagonal entries $\eta_{x,x}$ of this matrix are nonzero elements of $\mathbb{N}$ (because of (13.172.2)) and therefore invertible elements of $\mathbf{k}$ (since every nonzero element of $\mathbb{N}$ is an invertible element of $\mathbf{k}$). Thus, the matrix $(\eta_{x,y})_{(x,y)\in\operatorname{Comp}_n\times\operatorname{Comp}_n}$ (regarded as a matrix in $\mathbf{k}^{\operatorname{Comp}_n\times\operatorname{Comp}_n}$) is invertibly triangular.

Now, every $x\in\operatorname{Comp}_n$ satisfies

$$\sum_{y\in\operatorname{Comp}_n}\eta_{x,y}M_y=\underbrace{\sum_{\substack{y\in\operatorname{Comp}_n;\\ y\underset{\text{wll}}{\leq}x}}\eta_{x,y}M_y}_{\substack{=\mathbf{M}_x\\ \text{(by (13.172.1))}}}+\sum_{\substack{y\in\operatorname{Comp}_n;\\ \text{not } y\underset{\text{wll}}{\leq}x}}\underbrace{\eta_{x,y}}_{\substack{=0\\ \text{(by (13.172.3), applied to } (s,t)=(x,y))}}M_y$$
$$=\mathbf{M}_x+\underbrace{\sum_{\substack{y\in\operatorname{Comp}_n;\\ \text{not } y\underset{\text{wll}}{\leq}x}}}_{=0}0M_y=\mathbf{M}_x.$$

In other words, every $x\in\operatorname{Comp}_n$ satisfies $\mathbf{M}_x=\sum_{y\in\operatorname{Comp}_n}\eta_{x,y}M_y$. In other words, the family $(\mathbf{M}_u)_{u\in\operatorname{Comp}_n}$ expands in the family $(M_u)_{u\in\operatorname{Comp}_n}$ through the matrix $(\eta_{x,y})_{(x,y)\in\operatorname{Comp}_n\times\operatorname{Comp}_n}$. Since the latter matrix is invertibly triangular, we thus conclude that the family $(\mathbf{M}_u)_{u\in\operatorname{Comp}_n}$ expands invertibly triangularly in the family $(M_u)_{u\in\operatorname{Comp}_n}$.

[1147] Here, we have used the fact that the set Comp_n is finite.

[1148] *Proof of (13.173.1):* Let $s\in\{1,2,3,\ldots\}$ and $\mathbf{i}\in\operatorname{SIS}(\ell)$. Then, $\mathbf{i}$ is an ℓ-tuple of positive integers. Write $\mathbf{i}$ in the form $\mathbf{i}=(i_1,i_2,\ldots,i_\ell)$. Then, $\mathbf{x}_{\mathbf{i}}^{\alpha}=x_{i_1}^{\alpha_1}x_{i_2}^{\alpha_2}\cdots x_{i_\ell}^{\alpha_\ell}$ (by the definition of $\mathbf{x}_{\mathbf{i}}^{\alpha}$). Also, by the definition of $\mathbf{x}_{\mathbf{i}}^{\alpha\{s\}}$, we have $\mathbf{x}_{\mathbf{i}}^{\alpha\{s\}}=x_{i_1}^{s\alpha_1}x_{i_2}^{s\alpha_2}\cdots x_{i_\ell}^{s\alpha_\ell}$ (since $\alpha\{s\}=(s\alpha_1,s\alpha_2,\ldots,s\alpha_\ell)$). Now, taking both sides of the equality $\mathbf{x}_{\mathbf{i}}^{\alpha}=x_{i_1}^{\alpha_1}x_{i_2}^{\alpha_2}\cdots x_{i_\ell}^{\alpha_\ell}$ to the s-th power, we obtain

$$(\mathbf{x}_{\mathbf{i}}^{\alpha})^s=\left(x_{i_1}^{\alpha_1}x_{i_2}^{\alpha_2}\cdots x_{i_\ell}^{\alpha_\ell}\right)^s=\left(x_{i_1}^{\alpha_1}\right)^s\left(x_{i_2}^{\alpha_2}\right)^s\cdots\left(x_{i_\ell}^{\alpha_\ell}\right)^s=x_{i_1}^{s\alpha_1}x_{i_2}^{s\alpha_2}\cdots x_{i_\ell}^{s\alpha_\ell}=\mathbf{x}_{\mathbf{i}}^{\alpha\{s\}}.$$

This proves (13.173.1).

(a) Let s be a positive integer.

We begin with the following general observation:

If R is a topological commutative $\mathbf{k}$-algebra, if $\mathbf{I}$ is a countable (finite or not) set, and if $(s_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}} \in R^{\mathbf{I}}$ is a power-summable family of elements of R, then

$$p_s\left((s_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}}\right) = \sum_{\mathbf{i}\in\mathbf{I}} s_{\mathbf{i}}^s. \tag{13.173.2}$$

[1149] Applying this to $R = \mathbf{k}[[\mathbf{x}]]$, $\mathbf{I} = \operatorname{SIS}(\ell)$ and $\mathbf{s}_{\mathbf{i}} = \mathbf{x}_{\mathbf{i}}^{\alpha}$, we obtain

$$p_s\left(\left(\mathbf{x}_{\mathbf{i}}^{\alpha}\right)_{\mathbf{i}\in\operatorname{SIS}(\ell)}\right) = \sum_{\mathbf{i}\in\operatorname{SIS}(\ell)} \underbrace{\left(\mathbf{x}_{\mathbf{i}}^{\alpha}\right)^s}_{\substack{=\mathbf{x}_{\mathbf{i}}^{\alpha\{s\}} \\ \text{(by (13.173.1))}}} = \sum_{\mathbf{i}\in\operatorname{SIS}(\ell)} \mathbf{x}_{\mathbf{i}}^{\alpha\{s\}}.$$

[1149] *Proof of (13.173.2):* Let R be a topological commutative $\mathbf{k}$-algebra. Let $\mathbf{I}$ be a countable set. Let $(s_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}} \in R^{\mathbf{I}}$ be a power-summable family of elements of R. We need to prove that (13.173.2) holds.

We must be in one of the following two cases:

Case 1: The set $\mathbf{I}$ is infinite.

Case 2: The set $\mathbf{I}$ is finite.

Let us first consider Case 1. In this case, the set $\mathbf{I}$ is infinite, and therefore countably infinite (since it is countable). Fix a bijection $\mathrm{j} : \{1,2,3,\ldots\} \to \mathbf{I}$ (such a bijection clearly exists). Then, $p_s\left((s_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}}\right)$ is the result of substituting $s_{\mathrm{j}(1)}$, $s_{\mathrm{j}(2)}$, $s_{\mathrm{j}(3)}$, $\ldots$ for the variables x_1, x_2, x_3, $\ldots$ in p_s (by the definition of $p_s\left((s_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}}\right)$). Thus,

$$\begin{aligned}
&p_s\left((s_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}}\right) \\
&= \left(\text{the result of substituting } s_{\mathrm{j}(1)},\ s_{\mathrm{j}(2)},\ s_{\mathrm{j}(3)},\ \ldots \text{ for the variables } x_1,\ x_2,\ x_3,\ \ldots \text{ in } \underbrace{p_s}_{=\sum_{i\in\{1,2,3,\ldots\}} x_i^s}\right) \\
&= \left(\text{the result of substituting } s_{\mathrm{j}(1)},\ s_{\mathrm{j}(2)},\ s_{\mathrm{j}(3)},\ \ldots \text{ for the variables } x_1,\ x_2,\ x_3,\ \ldots \text{ in } \sum_{i\in\{1,2,3,\ldots\}} x_i^s\right) \\
&= \sum_{i\in\{1,2,3,\ldots\}} s_{\mathrm{j}(i)}^s = \sum_{\mathbf{i}\in\mathbf{I}} s_{\mathbf{i}}^s
\end{aligned}$$

(here, we have substituted $\mathbf{i}$ for $\mathrm{j}(i)$ in the sum, since the map $\mathrm{j} : \{1,2,3,\ldots\} \to \mathbf{I}$ is a bijection). Thus, (13.173.2) is proven in Case 1.

Let us now consider Case 2. In this case, the set $\mathbf{I}$ is finite. Fix a bijection $\mathrm{j} : \{1,2,\ldots,|\mathbf{I}|\} \to \mathbf{I}$ (such a bijection clearly exists). Then, $p_s\left((s_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}}\right)$ is the result of substituting $s_{\mathrm{j}(1)}$, $s_{\mathrm{j}(2)}$, $\ldots$, $s_{\mathrm{j}(|\mathbf{I}|)}$, 0, 0, 0, $\ldots$ for the variables x_1, x_2, x_3, $\ldots$ in p_s (by the definition of $p_s\left((s_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}}\right)$). Thus,

$$\begin{aligned}
&p_s\left((s_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}}\right) \\
&= \left(\text{the result of substituting } s_{\mathrm{j}(1)},\ s_{\mathrm{j}(2)},\ \ldots,\ s_{\mathrm{j}(|\mathbf{I}|)},\ 0,\ 0,\ 0,\ \ldots \text{ for the variables } x_1,\ x_2,\ x_3,\ \ldots \text{ in } \underbrace{\underbrace{p_s}_{=\sum_{i=1}^{\infty} x_i^s}}_{=\sum_{i=1}^{|\mathbf{I}|} x_i^s + \sum_{i=|\mathbf{I}|+1}^{\infty} x_i^s}\right) \\
&= \left(\text{the result of substituting } s_{\mathrm{j}(1)},\ s_{\mathrm{j}(2)},\ \ldots,\ s_{\mathrm{j}(|\mathbf{I}|)},\ 0,\ 0,\ 0,\ \ldots \text{ for the variables } x_1,\ x_2,\ x_3,\ \ldots \text{ in } \sum_{i=1}^{|\mathbf{I}|} x_i^s + \sum_{i=|\mathbf{I}|+1}^{\infty} x_i^s\right) \\
&= \underbrace{\sum_{i=1}^{|\mathbf{I}|}}_{=\sum_{i\in\{1,2,\ldots,|\mathbf{I}|\}}} s_{\mathrm{j}(i)}^s + \sum_{i=\mathrm{j}(|\mathbf{I}|)+1}^{\infty} \underbrace{0^s}_{\substack{=0 \\ (\text{since } s>0)}} = \sum_{i\in\{1,2,\ldots,|\mathbf{I}|\}} s_{\mathrm{j}(i)}^s + \underbrace{\sum_{i=\mathrm{j}(|\mathbf{I}|)+1}^{\infty} 0}_{=0} = \sum_{i\in\{1,2,\ldots,|\mathbf{I}|\}} s_{\mathrm{j}(i)}^s \\
&= \sum_{\mathbf{i}\in\mathbf{I}} s_{\mathbf{i}}^s
\end{aligned}$$

(here, we have substituted $\mathbf{i}$ for $\mathrm{j}(i)$ in the sum, since the map $\mathrm{j} : \{1,2,\ldots,|\mathbf{I}|\} \to \mathbf{I}$ is a bijection). Thus, (13.173.2) is proven in Case 2.

We have thus proven (13.173.2) in each of the Cases 1 and 2. Since these two Cases are the only cases that can occur, we thus conclude that (13.173.2) holds, qed.

Compared with $M_{\alpha\{s\}} = \sum_{\mathbf{i}\in\mathrm{SIS}(\ell)} \mathbf{x}_{\mathbf{i}}^{\alpha\{s\}}$ (by (6.5.1), applied to $\alpha\{s\}$ instead of α), this yields $p_s\left(\left(\mathbf{x}_{\mathbf{i}}^{\alpha}\right)_{\mathbf{i}\in\mathrm{SIS}(\ell)}\right) = M_{\alpha\{s\}}$. Exercise 6.5.4(a) is now solved.

(b) Let $s \in \mathbb{N}$. We shall first make some general statements.

- If R is a topological commutative $\mathbf{k}$-algebra, if $\mathbf{I}$ is a countable (finite or not) totally ordered set, and if $(s_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}} \in R^{\mathbf{I}}$ is a power-summable family of elements of R, then

$$\sum_{\substack{(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\in\mathbf{I}^s;\\ \mathbf{i}_1<\mathbf{i}_2<\cdots<\mathbf{i}_s}} s_{\mathbf{i}_1}s_{\mathbf{i}_2}\cdots s_{\mathbf{i}_s} = \sum_{\substack{\mathbf{K}\subset\mathbf{I};\\ |\mathbf{K}|=s}} \prod_{\mathbf{i}\in\mathbf{K}} s_{\mathbf{i}}. \tag{13.173.3}$$

[1150]

- If R is a commutative $\mathbf{k}$-algebra, if $\mathbf{I}$ and $\mathbf{J}$ are two sets, if $\mathsf{j} : \mathbf{J} \to \mathbf{I}$ is a bijection, and if $(s_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}} \in R^{\mathbf{I}}$ is a family of elements of R, then

$$\prod_{\mathbf{i}\in\mathsf{j}(\mathbf{K})} s_{\mathbf{i}} = \prod_{\mathbf{i}\in\mathbf{K}} s_{\mathsf{j}(\mathbf{i})} \qquad \text{for every finite subset } \mathbf{K} \text{ of } \mathbf{J}. \tag{13.173.4}$$

[1151]

- If R is a topological commutative $\mathbf{k}$-algebra, if $\mathbf{I}$ and $\mathbf{J}$ are two countable totally ordered sets, if $\mathsf{j} : \mathbf{J} \to \mathbf{I}$ is a (not necessarily order-preserving!) bijection, and if $(s_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}} \in R^{\mathbf{I}}$ is a power-summable family of elements of R, then

$$\sum_{\substack{(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\in\mathbf{I}^s;\\ \mathbf{i}_1<\mathbf{i}_2<\cdots<\mathbf{i}_s}} s_{\mathbf{i}_1}s_{\mathbf{i}_2}\cdots s_{\mathbf{i}_s} = \sum_{\substack{(\mathbf{j}_1,\mathbf{j}_2,\ldots,\mathbf{j}_s)\in\mathbf{J}^s;\\ \mathbf{j}_1<\mathbf{j}_2<\cdots<\mathbf{j}_s}} s_{\mathsf{j}(\mathbf{j}_1)}s_{\mathsf{j}(\mathbf{j}_2)}\cdots s_{\mathsf{j}(\mathbf{j}_s)}. \tag{13.173.5}$$

[1152]

[1150] *Proof of (13.173.3):* Let R be a topological commutative $\mathbf{k}$-algebra. Let $\mathbf{I}$ be a countable totally ordered set. Let $(s_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}} \in R^{\mathbf{I}}$ be a power-summable family of elements of R. We need to prove that (13.173.3) holds.

The order on $\mathbf{I}$ is total. Hence, the map

$$\{(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\in\mathbf{I}^s \mid \mathbf{i}_1<\mathbf{i}_2<\cdots<\mathbf{i}_s\} \to \{\mathbf{K}\subset\mathbf{I} \mid |\mathbf{K}|=s\},$$
$$(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s) \mapsto \{\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s\}$$

is a bijection (because every subset $\mathbf{K}$ of $\mathbf{I}$ satisfying $|\mathbf{K}| = s$ can be written in the form $\mathbf{K} = \{\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s\}$ for a unique s-tuple $(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\in\mathbf{I}^s$ satisfying $\mathbf{i}_1<\mathbf{i}_2<\cdots<\mathbf{i}_s$).

Now, let $(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\in\mathbf{I}^s$ be such that $\mathbf{i}_1<\mathbf{i}_2<\cdots<\mathbf{i}_s$. Then, the s-tuple $(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)$ is a list of all elements of the set $\{\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s\}$, each occurring exactly once (since the elements $\mathbf{i}_1$, $\mathbf{i}_2$, $\ldots$, $\mathbf{i}_s$ are distinct (since $\mathbf{i}_1<\mathbf{i}_2<\cdots<\mathbf{i}_s$)). Hence, $\prod_{\mathbf{i}\in\{\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s\}} s_{\mathbf{i}} = s_{\mathbf{i}_1}s_{\mathbf{i}_2}\cdots s_{\mathbf{i}_s}$, so that $s_{\mathbf{i}_1}s_{\mathbf{i}_2}\cdots s_{\mathbf{i}_s} = \prod_{\mathbf{i}\in\{\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s\}} s_{\mathbf{i}}$.

Now, let us forget that we fixed $(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\in\mathbf{I}^s$. We thus have shown that $s_{\mathbf{i}_1}s_{\mathbf{i}_2}\cdots s_{\mathbf{i}_s} = \prod_{\mathbf{i}\in\{\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s\}} s_{\mathbf{i}}$ for every $(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\in\mathbf{I}^s$ be such that $\mathbf{i}_1<\mathbf{i}_2<\cdots<\mathbf{i}_s$. Hence,

$$\sum_{\substack{(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\in\mathbf{I}^s;\\ \mathbf{i}_1<\mathbf{i}_2<\cdots<\mathbf{i}_s}} \underbrace{s_{\mathbf{i}_1}s_{\mathbf{i}_2}\cdots s_{\mathbf{i}_s}}_{=\prod_{\mathbf{i}\in\{\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s\}} s_{\mathbf{i}}} = \sum_{\substack{(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\in\mathbf{I}^s;\\ \mathbf{i}_1<\mathbf{i}_2<\cdots<\mathbf{i}_s}} \prod_{\mathbf{i}\in\{\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s\}} s_{\mathbf{i}} = \sum_{\substack{\mathbf{K}\subset\mathbf{I};\\ |\mathbf{K}|=s}} \prod_{\mathbf{i}\in\mathbf{K}} s_{\mathbf{i}}$$

(here, we have substituted $\mathbf{K}$ for $\{\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s\}$ in the sum, since the map

$$\{(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\in\mathbf{I}^s \mid \mathbf{i}_1<\mathbf{i}_2<\cdots<\mathbf{i}_s\} \to \{\mathbf{K}\subset\mathbf{I} \mid |\mathbf{K}|=s\},$$
$$(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s) \mapsto \{\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s\}$$

is a bijection). This proves (13.173.3).

[1151] *Proof of (13.173.4):* Let R be a commutative $\mathbf{k}$-algebra. Let $\mathbf{I}$ and $\mathbf{J}$ be two sets. Let $\mathsf{j} : \mathbf{J} \to \mathbf{I}$ be a bijection. Let $(s_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}} \in R^{\mathbf{I}}$ be a family of elements of R. Let $\mathbf{K}$ be a finite subset of $\mathbf{J}$. The map j is a bijection, and thus injective. Hence, the map $\mathbf{K} \to \mathsf{j}(\mathbf{K})$, $\mathbf{i} \mapsto \mathsf{j}(\mathbf{i})$ is a bijection. Hence, we can substitute $\mathsf{j}(\mathbf{i})$ for $\mathbf{i}$ in the product $\prod_{\mathbf{i}\in\mathsf{j}(\mathbf{K})} s_{\mathbf{i}}$. As a result, we obtain $\prod_{\mathbf{i}\in\mathsf{j}(\mathbf{K})} s_{\mathbf{i}} = \prod_{\mathbf{i}\in\mathbf{K}} s_{\mathsf{j}(\mathbf{i})}$. This proves (13.173.4).

[1152] *Proof of (13.173.5):* Let R be a topological commutative $\mathbf{k}$-algebra. Let $\mathbf{I}$ and $\mathbf{J}$ be two countable totally ordered sets. Let $\mathsf{j} : \mathbf{J} \to \mathbf{I}$ be a bijection. Let $(s_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}} \in R^{\mathbf{I}}$ be a power-summable family of elements of R.

Notice that $\left(s_{\mathsf{j}(\mathbf{i})}\right)_{\mathbf{i}\in\mathbf{J}} \in R^{\mathbf{J}}$ is a reindexing of the family $(s_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}} \in R^{\mathbf{I}}$ (since $\mathsf{j} : \mathbf{J} \to \mathbf{I}$ is a bijection), and thus a power-summable family of elements of R (since $(s_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}}$ is a power-summable family of elements of R).

The map

$$\{\mathbf{K}\subset\mathbf{J} \mid |\mathbf{K}|=s\} \to \{\mathbf{K}\subset\mathbf{I} \mid |\mathbf{K}|=s\},$$
$$\mathbf{K} \mapsto \mathsf{j}(\mathbf{K})$$

- If R is a topological commutative $\mathbf{k}$-algebra, if $\mathbf{I}$ is a countable (finite or not) totally ordered set, and if $(s_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}} \in R^{\mathbf{I}}$ is a power-summable family of elements of R, then

$$e_s\left((s_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}}\right) = \sum_{\substack{(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\in\mathbf{I}^s;\\ \mathbf{i}_1<\mathbf{i}_2<\cdots<\mathbf{i}_s}} s_{\mathbf{i}_1}s_{\mathbf{i}_2}\cdots s_{\mathbf{i}_s}. \tag{13.173.7}$$

[1153]

Now, let us return to our proof. Applying (13.173.7) to $R = \mathbf{k}[[\mathbf{x}]]$, $\mathbf{I} = \operatorname{SIS}(\ell)$ and $\mathbf{s_i} = \mathbf{x}_{\mathbf{i}}^{\alpha}$, we obtain

$$e_s\left((\mathbf{x}_{\mathbf{i}}^{\alpha})_{\mathbf{i}\in\operatorname{SIS}(\ell)}\right) = \sum_{\substack{(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\in(\operatorname{SIS}(\ell))^s;\\ \mathbf{i}_1<\mathbf{i}_2<\cdots<\mathbf{i}_s}} \mathbf{x}_{\mathbf{i}_1}^{\alpha}\mathbf{x}_{\mathbf{i}_2}^{\alpha}\cdots\mathbf{x}_{\mathbf{i}_s}^{\alpha}.$$

Thus,

$$M_{\alpha}^{\langle s\rangle} = e_s\left((\mathbf{x}_{\mathbf{i}}^{\alpha})_{\mathbf{i}\in\operatorname{SIS}(\ell)}\right) = \sum_{\substack{(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\in(\operatorname{SIS}(\ell))^s;\\ \mathbf{i}_1<\mathbf{i}_2<\cdots<\mathbf{i}_s}} \mathbf{x}_{\mathbf{i}_1}^{\alpha}\mathbf{x}_{\mathbf{i}_2}^{\alpha}\cdots\mathbf{x}_{\mathbf{i}_s}^{\alpha}.$$

This solves Exercise 6.5.4(b).

is a bijection (since j is a bijection from $\mathbf{J}$ to $\mathbf{I}$). Hence, we can substitute $\mathrm{j}(\mathbf{K})$ for $\mathbf{K}$ in the sum $\sum_{\substack{\mathbf{K}\subset\mathbf{I};\\ |\mathbf{K}|=s}} \prod_{\mathbf{i}\in\mathbf{K}} s_{\mathbf{i}}$, and as a result we obtain

$$\sum_{\substack{\mathbf{K}\subset\mathbf{I};\\ |\mathbf{K}|=s}} \prod_{\mathbf{i}\in\mathbf{K}} s_{\mathbf{i}} = \sum_{\substack{\mathbf{K}\subset\mathbf{J};\\ |\mathbf{K}|=s}} \underbrace{\prod_{\mathbf{i}\in\mathrm{j}(\mathbf{K})} s_{\mathbf{i}}}_{\substack{=\prod_{\mathbf{i}\in\mathbf{K}} s_{\mathrm{j}(\mathbf{i})}\\ \text{(by (13.173.4))}}} = \sum_{\substack{\mathbf{K}\subset\mathbf{J};\\ |\mathbf{K}|=s}} \prod_{\mathbf{i}\in\mathbf{K}} s_{\mathrm{j}(\mathbf{i})}.$$

Thus, (13.173.3) becomes

$$\sum_{\substack{(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\in\mathbf{I}^s;\\ \mathbf{i}_1<\mathbf{i}_2<\cdots<\mathbf{i}_s}} s_{\mathbf{i}_1}s_{\mathbf{i}_2}\cdots s_{\mathbf{i}_s} = \sum_{\substack{\mathbf{K}\subset\mathbf{I};\\ |\mathbf{K}|=s}} \prod_{\mathbf{i}\in\mathbf{K}} s_{\mathbf{i}} = \sum_{\substack{\mathbf{K}\subset\mathbf{J};\\ |\mathbf{K}|=s}} \prod_{\mathbf{i}\in\mathbf{K}} s_{\mathrm{j}(\mathbf{i})}. \tag{13.173.6}$$

But

$$\begin{aligned}\sum_{\substack{(\mathbf{j}_1,\mathbf{j}_2,\ldots,\mathbf{j}_s)\in\mathbf{J}^s;\\ \mathbf{j}_1<\mathbf{j}_2<\cdots<\mathbf{j}_s}} s_{\mathrm{j}(\mathbf{j}_1)}s_{\mathrm{j}(\mathbf{j}_2)}\cdots s_{\mathrm{j}(\mathbf{j}_s)} &= \sum_{\substack{(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\in\mathbf{J}^s;\\ \mathbf{i}_1<\mathbf{i}_2<\cdots<\mathbf{i}_s}} s_{\mathrm{j}(\mathbf{i}_1)}s_{\mathrm{j}(\mathbf{i}_2)}\cdots s_{\mathrm{j}(\mathbf{i}_s)}\\ &\qquad \left(\text{here, we renamed the summation index } (\mathbf{j}_1,\mathbf{j}_2,\ldots,\mathbf{j}_s) \text{ as } (\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\right)\\ &= \sum_{\substack{\mathbf{K}\subset\mathbf{J};\\ |\mathbf{K}|=s}} \prod_{\mathbf{i}\in\mathbf{K}} s_{\mathrm{j}(\mathbf{i})}\end{aligned}$$

(by (13.173.3), applied to $\mathbf{J}$ and $s_{\mathrm{j}(\mathbf{i})}$ instead of $\mathbf{I}$ and $s_{\mathbf{i}}$). Compared with (13.173.6), this yields

$$\sum_{\substack{(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\in\mathbf{I}^s;\\ \mathbf{i}_1<\mathbf{i}_2<\cdots<\mathbf{i}_s}} s_{\mathbf{i}_1}s_{\mathbf{i}_2}\cdots s_{\mathbf{i}_s} = \sum_{\substack{(\mathbf{j}_1,\mathbf{j}_2,\ldots,\mathbf{j}_s)\in\mathbf{J}^s;\\ \mathbf{j}_1<\mathbf{j}_2<\cdots<\mathbf{j}_s}} s_{\mathrm{j}(\mathbf{j}_1)}s_{\mathrm{j}(\mathbf{j}_2)}\cdots s_{\mathrm{j}(\mathbf{j}_s)}.$$

This proves (13.173.5).

[1153] *Proof of (13.173.7):* Let R be a topological commutative $\mathbf{k}$-algebra. Let $\mathbf{I}$ be a countable totally ordered set. Let $(s_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}} \in R^{\mathbf{I}}$ be a power-summable family of elements of R. We need to prove that (13.173.7) holds.

The definition of e_s yields

$$e_s = \sum_{\substack{(i_1,i_2,\ldots,i_s)\in\{1,2,3,\ldots\}^s;\\ i_1<i_2<\cdots<i_s}} x_{i_1}x_{i_2}\cdots x_{i_s} = \sum_{\substack{(\mathbf{j}_1,\mathbf{j}_2,\ldots,\mathbf{j}_s)\in\{1,2,3,\ldots\}^s;\\ \mathbf{j}_1<\mathbf{j}_2<\cdots<\mathbf{j}_s}} x_{\mathbf{j}_1}x_{\mathbf{j}_2}\cdots x_{\mathbf{j}_s} \tag{13.173.8}$$

(here, we renamed the summation index $(i_1,i_2,\ldots,i_s)$ as $(\mathbf{j}_1,\mathbf{j}_2,\ldots,\mathbf{j}_s)$).

We must be in one of the following two cases:

Case 1: The set $\mathbf{I}$ is infinite.

Case 2: The set $\mathbf{I}$ is finite.

Let us first consider Case 1. In this case, the set $\mathbf{I}$ is infinite, and therefore countably infinite (since it is countable). Let $\mathbf{J}$ denote the totally ordered set $\{1,2,3,\ldots\}$. Then, (13.173.8) rewrites as

$$e_s = \sum_{\substack{(\mathbf{j}_1,\mathbf{j}_2,\ldots,\mathbf{j}_s)\in\{1,2,3,\ldots\}^s;\\ \mathbf{j}_1<\mathbf{j}_2<\cdots<\mathbf{j}_s}} x_{\mathbf{j}_1}x_{\mathbf{j}_2}\cdots x_{\mathbf{j}_s} = \sum_{\substack{(\mathbf{j}_1,\mathbf{j}_2,\ldots,\mathbf{j}_s)\in\mathbf{J}^s;\\ \mathbf{j}_1<\mathbf{j}_2<\cdots<\mathbf{j}_s}} x_{\mathbf{j}_1}x_{\mathbf{j}_2}\cdots x_{\mathbf{j}_s} \tag{13.173.9}$$

(since $\{1,2,3,\ldots\} = \mathbf{J}$).

Fix a bijection $\mathrm{j} : \{1, 2, 3, \ldots\} \to \mathbf{I}$ (such a bijection clearly exists, since $\mathbf{I}$ is countably infinite). Then, $e_s\left((s_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}}\right)$ is the result of substituting $s_{\mathrm{j}(1)}$, $s_{\mathrm{j}(2)}$, $s_{\mathrm{j}(3)}$, $\ldots$ for the variables x_1, x_2, x_3, $\ldots$ in e_s (by the definition of $e_s\left((s_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}}\right)$). Thus,

$$\begin{aligned}
&e_s\left((s_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}}\right)\\
&= \left(\text{the result of substituting } s_{\mathrm{j}(1)},\ s_{\mathrm{j}(2)},\ s_{\mathrm{j}(3)},\ \ldots \text{ for the variables } x_1,\ x_2,\ x_3,\ \ldots \text{ in } \underbrace{e_s}_{\substack{=\sum_{\substack{(\mathbf{j}_1,\mathbf{j}_2,\ldots,\mathbf{j}_s)\in\mathbf{J}^s;\\ \mathbf{j}_1<\mathbf{j}_2<\cdots<\mathbf{j}_s}} x_{\mathbf{j}_1}x_{\mathbf{j}_2}\cdots x_{\mathbf{j}_s}\\ \text{(by (13.173.9))}}}\right)\\
&= \left(\text{the result of substituting } s_{\mathrm{j}(1)},\ s_{\mathrm{j}(2)},\ s_{\mathrm{j}(3)},\ \ldots \text{ for the variables } x_1,\ x_2,\ x_3,\ \ldots \text{ in } \sum_{\substack{(\mathbf{j}_1,\mathbf{j}_2,\ldots,\mathbf{j}_s)\in\mathbf{J}^s;\\ \mathbf{j}_1<\mathbf{j}_2<\cdots<\mathbf{j}_s}} x_{\mathbf{j}_1}x_{\mathbf{j}_2}\cdots x_{\mathbf{j}_s}\right)\\
&= \sum_{\substack{(\mathbf{j}_1,\mathbf{j}_2,\ldots,\mathbf{j}_s)\in\mathbf{J}^s;\\ \mathbf{j}_1<\mathbf{j}_2<\cdots<\mathbf{j}_s}} s_{\mathrm{j}(\mathbf{j}_1)}s_{\mathrm{j}(\mathbf{j}_2)}\cdots s_{\mathrm{j}(\mathbf{j}_s)}.
\end{aligned} \tag{13.173.10}$$

But $\mathbf{J}$ is a countable totally ordered set (since $\mathbf{J} = \{1, 2, 3, \ldots\}$). Also, j is a bijection $\{1, 2, 3, \ldots\} \to \mathbf{I}$. In other words, j is a bijection $\mathbf{J} \to \mathbf{I}$ (since $\mathbf{J} = \{1, 2, 3, \ldots\}$). Now, (13.173.10) becomes

$$e_s\left((s_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}}\right) = \sum_{\substack{(\mathbf{j}_1,\mathbf{j}_2,\ldots,\mathbf{j}_s)\in\mathbf{J}^s;\\ \mathbf{j}_1<\mathbf{j}_2<\cdots<\mathbf{j}_s}} s_{\mathrm{j}(\mathbf{j}_1)}s_{\mathrm{j}(\mathbf{j}_2)}\cdots s_{\mathrm{j}(\mathbf{j}_s)} = \sum_{\substack{(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\in\mathbf{I}^s;\\ \mathbf{i}_1<\mathbf{i}_2<\cdots<\mathbf{i}_s}} s_{\mathbf{i}_1}s_{\mathbf{i}_2}\cdots s_{\mathbf{i}_s}$$

(by (13.173.5)). Thus, (13.173.7) is proven in Case 1.

Let us now consider Case 2. In this case, the set $\mathbf{I}$ is finite. Let $\mathbf{J}$ denote the totally ordered set $\{1, 2, \ldots, |\mathbf{I}|\}$. Then, $\mathbf{J} = \{1, 2, \ldots, |\mathbf{I}|\} \subset \{1, 2, 3, \ldots\}$ and $\{1, 2, 3, \ldots\} \setminus \underbrace{\mathbf{J}}_{=\{1,2,\ldots,|\mathbf{I}|\}} = \{1, 2, 3, \ldots\} \setminus \{1, 2, \ldots, |\mathbf{I}|\} = \{|\mathbf{I}| + 1, |\mathbf{I}| + 2, |\mathbf{I}| + 3, \ldots\}$.

Fix a bijection $\mathrm{j} : \{1, 2, \ldots, |\mathbf{I}|\} \to \mathbf{I}$ (such a bijection clearly exists, since $\mathbf{I}$ is finite). Then, $e_s\left((s_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}}\right)$ is the result of substituting $s_{\mathrm{j}(1)}$, $s_{\mathrm{j}(2)}$, $\ldots$, $s_{\mathrm{j}(|\mathbf{I}|)}$, $0, 0, 0, \ldots$ for the variables x_1, x_2, x_3, $\ldots$ in e_s (by the definition of $e_s\left((s_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}}\right)$). Thus,

$$\begin{aligned}
&e_s\left((s_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}}\right)\\
&= \left(\text{the result of substituting } s_{\mathrm{j}(1)},\ s_{\mathrm{j}(2)},\ \ldots,\ s_{\mathrm{j}(|\mathbf{I}|)},\ 0,\ 0,\ 0,\ \ldots \text{ for the variables } x_1,\ x_2,\ x_3,\ \ldots \text{ in } \underbrace{e_s}_{\substack{=\sum_{\substack{(\mathbf{j}_1,\mathbf{j}_2,\ldots,\mathbf{j}_s)\in\{1,2,3,\ldots\}^s;\\ \mathbf{j}_1<\mathbf{j}_2<\cdots<\mathbf{j}_s}} x_{\mathbf{j}_1}x_{\mathbf{j}_2}\cdots x_{\mathbf{j}_s}\\ \text{(by (13.173.8))}}}\right)\\
&= \left(\text{the result of substituting } s_{\mathrm{j}(1)},\ s_{\mathrm{j}(2)},\ \ldots,\ s_{\mathrm{j}(|\mathbf{I}|)},\ 0,\ 0,\ 0,\ \ldots \text{ for the variables } x_1,\ x_2,\ x_3,\ \ldots \text{ in } \sum_{\substack{(\mathbf{j}_1,\mathbf{j}_2,\ldots,\mathbf{j}_s)\in\{1,2,3,\ldots\}^s;\\ \mathbf{j}_1<\mathbf{j}_2<\cdots<\mathbf{j}_s}} x_{\mathbf{j}_1}x_{\mathbf{j}_2}\cdots x_{\mathbf{j}_s}\right)\\
&= \sum_{\substack{(\mathbf{j}_1,\mathbf{j}_2,\ldots,\mathbf{j}_s)\in\{1,2,3,\ldots\}^s;\\ \mathbf{j}_1<\mathbf{j}_2<\cdots<\mathbf{j}_s}} \left(\text{the result of substituting } s_{\mathrm{j}(1)},\ s_{\mathrm{j}(2)},\ \ldots,\ s_{\mathrm{j}(|\mathbf{I}|)},\ 0,\ 0,\ 0,\ \ldots \text{ for the variables } x_1,\ x_2,\ x_3,\ \ldots \text{ in } x_{\mathbf{j}_1}x_{\mathbf{j}_2}\cdots x_{\mathbf{j}_s}\right).
\end{aligned} \tag{13.173.11}$$

Now, let us fix some $(\mathbf{j}_1, \mathbf{j}_2, \ldots, \mathbf{j}_s) \in \mathbf{J}^s$. Then, every $k \in \{1, 2, \ldots, s\}$ satisfies $\mathbf{j}_k \in \mathbf{J} = \{1, 2, \ldots, |\mathbf{I}|\}$. Hence, for every $k \in \{1, 2, \ldots, s\}$, the substitution of $s_{\mathrm{j}(1)}$, $s_{\mathrm{j}(2)}$, $\ldots$, $s_{\mathrm{j}(|\mathbf{I}|)}$, $0, 0, 0, \ldots$ for the variables x_1, x_2, x_3, $\ldots$ transforms the indeterminate $x_{\mathbf{j}_k}$ into $s_{\mathrm{j}(\mathbf{j}_k)}$. Consequently, the substitution of $s_{\mathrm{j}(1)}$, $s_{\mathrm{j}(2)}$, $\ldots$, $s_{\mathrm{j}(|\mathbf{I}|)}$, $0, 0, 0, \ldots$ for the variables x_1, x_2, x_3, $\ldots$ transforms the product $x_{\mathbf{j}_1}x_{\mathbf{j}_2}\cdots x_{\mathbf{j}_s}$ into $s_{\mathrm{j}(\mathbf{j}_1)}s_{\mathrm{j}(\mathbf{j}_2)}\cdots s_{\mathrm{j}(\mathbf{j}_s)}$. In other words,

$$\begin{aligned}
&\left(\text{the result of substituting } s_{\mathrm{j}(1)},\ s_{\mathrm{j}(2)},\ \ldots,\ s_{\mathrm{j}(|\mathbf{I}|)},\ 0,\ 0,\ 0,\ \ldots \text{ for the variables } x_1,\ x_2,\ x_3,\ \ldots \text{ in } x_{\mathbf{j}_1}x_{\mathbf{j}_2}\cdots x_{\mathbf{j}_s}\right)\\
&= s_{\mathrm{j}(\mathbf{j}_1)}s_{\mathrm{j}(\mathbf{j}_2)}\cdots s_{\mathrm{j}(\mathbf{j}_s)}.
\end{aligned} \tag{13.173.12}$$

(c) Every $\mathbf{i} \in \operatorname{SIS}(\ell)$ satisfies $(\mathbf{x}_{\mathbf{i}}^{\alpha})^n = \mathbf{x}_{\mathbf{i}}^{\alpha\{n\}}$ (by (13.173.1), applied to n instead of s). In other words, every $\mathbf{i} \in \operatorname{SIS}(\ell)$ satisfies $\mathbf{x}_{\mathbf{i}}^{\alpha\{n\}} = (\mathbf{x}_{\mathbf{i}}^{\alpha})^n$. Now, by the definition of $M_{\alpha\{n\}}^{\langle s\rangle}$, we have

$$M_{\alpha\{n\}}^{\langle s\rangle} = e_s\left(\left(\underbrace{\mathbf{x}_{\mathbf{i}}^{\alpha\{n\}}}_{=(\mathbf{x}_{\mathbf{i}}^{\alpha})^n}\right)_{\mathbf{i}\in\operatorname{SIS}(\ell)}\right) = e_s\left(\left((\mathbf{x}_{\mathbf{i}}^{\alpha})^n\right)_{\mathbf{i}\in\operatorname{SIS}(\ell)}\right). \tag{13.173.15}$$

We now notice that if R is a topological commutative $\mathbf{k}$-algebra, if $\mathbf{I}$ is a countable set, and if $(s_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}} \in R^{\mathbf{I}}$ is a power-summable family of elements of R, then

$$e_s^{\langle n\rangle}\left((\mathbf{s}_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}}\right) = e_s\left((\mathbf{s}_{\mathbf{i}}^n)_{\mathbf{i}\in\mathbf{I}}\right). \tag{13.173.16}$$

Now, let us forget that we fixed $(\mathbf{j}_1, \mathbf{j}_2, \ldots, \mathbf{j}_s) \in \mathbf{J}^s$. We thus have shown that (13.173.12) holds for every $(\mathbf{j}_1, \mathbf{j}_2, \ldots, \mathbf{j}_s) \in \mathbf{J}^s$.

On the other hand, let us fix some $(\mathbf{j}_1, \mathbf{j}_2, \ldots, \mathbf{j}_s) \in \{1, 2, 3, \ldots\}^s \setminus \mathbf{J}^s$. Since $(\mathbf{j}_1, \mathbf{j}_2, \ldots, \mathbf{j}_s) \in \{1, 2, 3, \ldots\}^s \setminus \mathbf{J}^s$, we must have $(\mathbf{j}_1, \mathbf{j}_2, \ldots, \mathbf{j}_s) \in \{1, 2, 3, \ldots\}^s$ but $(\mathbf{j}_1, \mathbf{j}_2, \ldots, \mathbf{j}_s) \notin \mathbf{J}^s$. Since $(\mathbf{j}_1, \mathbf{j}_2, \ldots, \mathbf{j}_s) \notin \mathbf{J}^s$, there exists some $k \in \{1, 2, \ldots, s\}$ such that $\mathbf{j}_k \notin \mathbf{J}$. Fix this k. We have $\mathbf{j}_k \in \{1, 2, 3, \ldots\}$ but $\mathbf{j}_k \notin \mathbf{J}$; therefore, $\mathbf{j}_k \in \{1, 2, 3, \ldots\} \setminus \mathbf{J} = \{|\mathbf{I}|+1, |\mathbf{I}|+2, |\mathbf{I}|+3, \ldots\}$. In other words, $\mathbf{j}_k > |\mathbf{I}|$. Hence, the substitution of $s_{\mathbf{j}(1)}$, $s_{\mathbf{j}(2)}$, $\ldots$, $s_{\mathbf{j}(|\mathbf{I}|)}$, $0, 0, 0, \ldots$ for the variables x_1, x_2, x_3, $\ldots$ transforms the indeterminate $x_{\mathbf{j}_k}$ into 0. In other words,

$$\begin{aligned}&\left(\text{the result of substituting } s_{\mathbf{j}(1)}, s_{\mathbf{j}(2)}, \ldots, s_{\mathbf{j}(|\mathbf{I}|)}, 0, 0, 0, \ldots \text{ for the variables } x_1, x_2, x_3, \ldots \text{ in } x_{\mathbf{j}_k}\right)\\ &= 0.\end{aligned}$$

Now,

$$\begin{aligned}&\left(\text{the result of substituting } s_{\mathbf{j}(1)}, s_{\mathbf{j}(2)}, \ldots, s_{\mathbf{j}(|\mathbf{I}|)}, 0, 0, 0, \ldots \text{ for the variables } x_1, x_2, x_3, \ldots \text{ in } \underbrace{x_{\mathbf{j}_1} x_{\mathbf{j}_2} \cdots x_{\mathbf{j}_s}}_{=\prod_{z\in\{1,2,\ldots,s\}} x_{\mathbf{j}_z}}\right)\\
&= \left(\text{the result of substituting } s_{\mathbf{j}(1)}, s_{\mathbf{j}(2)}, \ldots, s_{\mathbf{j}(|\mathbf{I}|)}, 0, 0, 0, \ldots \text{ for the variables } x_1, x_2, x_3, \ldots \text{ in } \prod_{z\in\{1,2,\ldots,s\}} x_{\mathbf{j}_z}\right)\\
&= \prod_{z\in\{1,2,\ldots,s\}} \left(\text{the result of substituting } s_{\mathbf{j}(1)}, s_{\mathbf{j}(2)}, \ldots, s_{\mathbf{j}(|\mathbf{I}|)}, 0, 0, 0, \ldots \text{ for the variables } x_1, x_2, x_3, \ldots \text{ in } x_{\mathbf{j}_z}\right)\\
&= \underbrace{\left(\text{the result of substituting } s_{\mathbf{j}(1)}, s_{\mathbf{j}(2)}, \ldots, s_{\mathbf{j}(|\mathbf{I}|)}, 0, 0, 0, \ldots \text{ for the variables } x_1, x_2, x_3, \ldots \text{ in } x_{\mathbf{j}_k}\right)}_{=0}\\
&\qquad \cdot \prod_{\substack{z\in\{1,2,\ldots,s\};\\ z\neq k}} \left(\text{the result of substituting } s_{\mathbf{j}(1)}, s_{\mathbf{j}(2)}, \ldots, s_{\mathbf{j}(|\mathbf{I}|)}, 0, 0, 0, \ldots \text{ for the variables } x_1, x_2, x_3, \ldots \text{ in } x_{\mathbf{j}_z}\right)\\
&\qquad \left(\text{here, we have split off the factor for } z = k \text{ from the product}\right)\\
&= 0.\end{aligned} \tag{13.173.13}$$

Now, let us forget that we fixed $(\mathbf{j}_1, \mathbf{j}_2, \ldots, \mathbf{j}_s) \in \{1, 2, 3, \ldots\}^s \setminus \mathbf{J}^s$. We thus have shown that (13.173.13) holds for every $(\mathbf{j}_1, \mathbf{j}_2, \ldots, \mathbf{j}_s) \in \{1, 2, 3, \ldots\}^s \setminus \mathbf{J}^s$.

But $\mathbf{J}^s \subset \{1, 2, 3, \ldots\}^s$ (since $\mathbf{J} \subset \{1, 2, 3, \ldots\}$). Hence, the set $\{1, 2, 3, \ldots\}^s$ is the union of its two disjoint subsets $\mathbf{J}^s$ and $\{1, 2, 3, \ldots\}^s \setminus \mathbf{J}^s$. Now, (13.173.11) becomes

[1154] Applying this to $R = \mathbf{k}[[\mathbf{x}]]$, $\mathbf{I} = \operatorname{SIS}(\ell)$ and $s_{\mathbf{i}} = \mathbf{x}_{\mathbf{i}}^{\alpha}$, we obtain

$$e_s^{\langle n\rangle}\left(\left(\mathbf{x}_{\mathbf{i}}^{\alpha}\right)_{\mathbf{i}\in\operatorname{SIS}(\ell)}\right) = e_s\left(\left(\left(\mathbf{x}_{\mathbf{i}}^{\alpha}\right)^n\right)_{\mathbf{i}\in\operatorname{SIS}(\ell)}\right).$$

Compared with (13.173.15), this yields $M_{\alpha\{n\}}^{\langle s\rangle} = e_s^{\langle n\rangle}\left(\left(\mathbf{x}_{\mathbf{i}}^{\alpha}\right)_{\mathbf{i}\in\operatorname{SIS}(\ell)}\right)$. This solves Exercise 6.5.4(c).

(d) The first sentence of Proposition 2.4.1 yields that the family $(e_1, e_2, e_3, \ldots)$ generates the $\mathbf{k}$-algebra Λ. Thus, every element of Λ can be written as a polynomial in the elements $e_1, e_2, e_3, \ldots$. Applying this to

---

$$\begin{aligned}
&e_s\left((s_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}}\right)\\
&= \sum_{\substack{(\mathbf{j}_1,\mathbf{j}_2,\ldots,\mathbf{j}_s)\in\{1,2,3,\ldots\}^s;\\ \mathbf{j}_1<\mathbf{j}_2<\cdots<\mathbf{j}_s}} \left(\text{the result of substituting } s_{\mathrm{j}(1)},\ s_{\mathrm{j}(2)},\ \ldots,\ s_{\mathrm{j}(|\mathbf{I}|)},\ 0,\ 0,\ 0,\ \ldots \text{ for the variables } x_1,\ x_2,\ x_3,\ \ldots \text{ in } x_{\mathbf{j}_1}x_{\mathbf{j}_2}\cdots x_{\mathbf{j}_s}\right)\\
&= \sum_{\substack{(\mathbf{j}_1,\mathbf{j}_2,\ldots,\mathbf{j}_s)\in\mathbf{J}^s;\\ \mathbf{j}_1<\mathbf{j}_2<\cdots<\mathbf{j}_s}} \underbrace{\left(\text{the result of substituting } s_{\mathrm{j}(1)},\ s_{\mathrm{j}(2)},\ \ldots,\ s_{\mathrm{j}(|\mathbf{I}|)},\ 0,\ 0,\ 0,\ \ldots \text{ for the variables } x_1,\ x_2,\ x_3,\ \ldots \text{ in } x_{\mathbf{j}_1}x_{\mathbf{j}_2}\cdots x_{\mathbf{j}_s}\right)}_{\substack{=s_{\mathrm{j}(\mathbf{j}_1)}s_{\mathrm{j}(\mathbf{j}_2)}\cdots s_{\mathrm{j}(\mathbf{j}_s)}\\ \text{(by (13.173.12))}}}\\
&\qquad + \sum_{\substack{(\mathbf{j}_1,\mathbf{j}_2,\ldots,\mathbf{j}_s)\in\{1,2,3,\ldots\}^s\setminus\mathbf{J}^s;\\ \mathbf{j}_1<\mathbf{j}_2<\cdots<\mathbf{j}_s}}\\
&\qquad\qquad \underbrace{\left(\text{the result of substituting } s_{\mathrm{j}(1)},\ s_{\mathrm{j}(2)},\ \ldots,\ s_{\mathrm{j}(|\mathbf{I}|)},\ 0,\ 0,\ 0,\ \ldots \text{ for the variables } x_1,\ x_2,\ x_3,\ \ldots \text{ in } x_{\mathbf{j}_1}x_{\mathbf{j}_2}\cdots x_{\mathbf{j}_s}\right)}_{\substack{=0\\ \text{(by (13.173.13))}}}\\
&\qquad \left(\text{since the set } \{1,2,3,\ldots\}^s \text{ is the union of its two disjoint subsets } \mathbf{J}^s \text{ and } \{1,2,3,\ldots\}^s\setminus\mathbf{J}^s\right)\\
&= \sum_{\substack{(\mathbf{j}_1,\mathbf{j}_2,\ldots,\mathbf{j}_s)\in\mathbf{J}^s;\\ \mathbf{j}_1<\mathbf{j}_2<\cdots<\mathbf{j}_s}} s_{\mathrm{j}(\mathbf{j}_1)}s_{\mathrm{j}(\mathbf{j}_2)}\cdots s_{\mathrm{j}(\mathbf{j}_s)} + \underbrace{\sum_{\substack{(\mathbf{j}_1,\mathbf{j}_2,\ldots,\mathbf{j}_s)\in\{1,2,3,\ldots\}^s\setminus\mathbf{J}^s;\\ \mathbf{j}_1<\mathbf{j}_2<\cdots<\mathbf{j}_s}} 0}_{=0}\\
&= \sum_{\substack{(\mathbf{j}_1,\mathbf{j}_2,\ldots,\mathbf{j}_s)\in\mathbf{J}^s;\\ \mathbf{j}_1<\mathbf{j}_2<\cdots<\mathbf{j}_s}} s_{\mathrm{j}(\mathbf{j}_1)}s_{\mathrm{j}(\mathbf{j}_2)}\cdots s_{\mathrm{j}(\mathbf{j}_s)}.
\end{aligned} \tag{13.173.14}$$

But $\mathbf{J}$ is a countable totally ordered set (since $\mathbf{J} = \{1, 2, \ldots, |\mathbf{I}|\}$). Also, j is a bijection $\{1, 2, \ldots, |\mathbf{I}|\} \to \mathbf{I}$. In other words, j is a bijection $\mathbf{J} \to \mathbf{I}$ (since $\mathbf{J} = \{1, 2, \ldots, |\mathbf{I}|\}$). Now, (13.173.14) becomes

$$e_s\left((s_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}}\right) = \sum_{\substack{(\mathbf{j}_1,\mathbf{j}_2,\ldots,\mathbf{j}_s)\in\mathbf{J}^s;\\ \mathbf{j}_1<\mathbf{j}_2<\cdots<\mathbf{j}_s}} s_{\mathrm{j}(\mathbf{j}_1)}s_{\mathrm{j}(\mathbf{j}_2)}\cdots s_{\mathrm{j}(\mathbf{j}_s)} = \sum_{\substack{(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\in\mathbf{I}^s;\\ \mathbf{i}_1<\mathbf{i}_2<\cdots<\mathbf{i}_s}} s_{\mathbf{i}_1}s_{\mathbf{i}_2}\cdots s_{\mathbf{i}_s}$$

(by (13.173.5)). Thus, (13.173.7) is proven in Case 2.

We have thus proven (13.173.7) in each of the Cases 1 and 2. Since these two Cases are the only cases that can occur, we thus conclude that (13.173.7) holds, qed.

[1154] *Proof of (13.173.16):* Let R be a topological commutative $\mathbf{k}$-algebra. Let $\mathbf{I}$ be a countable set. Let $(s_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}} \in R^{\mathbf{I}}$ be a power-summable family of elements of R.

We must be in one of the following two cases:

Case 1: The set $\mathbf{I}$ is infinite.

Case 2: The set $\mathbf{I}$ is finite.

Let us first consider Case 1. In this case, the set $\mathbf{I}$ is infinite, and therefore countably infinite (since it is countable). Fix a bijection $\mathrm{j} : \{1, 2, 3, \ldots\} \to \mathbf{I}$ (such a bijection clearly exists, since $\mathbf{I}$ is countably infinite). Then, $e_s^{\langle n\rangle}\left((s_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}}\right)$ is the result of substituting $s_{\mathrm{j}(1)}, s_{\mathrm{j}(2)}, s_{\mathrm{j}(3)}, \ldots$ for the variables $x_1, x_2, x_3, \ldots$ in $e_s^{\langle n\rangle}$ (by the definition of $e_s^{\langle n\rangle}\left((s_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}}\right)$). Thus,

$$\begin{aligned}
&e_s^{\langle n\rangle}\left((s_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}}\right)\\
&= \left(\text{the result of substituting } s_{\mathrm{j}(1)},\ s_{\mathrm{j}(2)},\ s_{\mathrm{j}(3)},\ \ldots \text{ for the variables } x_1,\ x_2,\ x_3,\ \ldots \text{ in } \underbrace{e_s^{\langle n\rangle}}_{=\sum_{i_1<i_2<\cdots<i_s} x_{i_1}^n x_{i_2}^n\cdots x_{i_s}^n}\right)\\
&= \left(\text{the result of substituting } s_{\mathrm{j}(1)},\ s_{\mathrm{j}(2)},\ s_{\mathrm{j}(3)},\ \ldots \text{ for the variables } x_1,\ x_2,\ x_3,\ \ldots \text{ in } \sum_{i_1<i_2<\cdots<i_s} x_{i_1}^n x_{i_2}^n\cdots x_{i_s}^n\right)\\
&= \sum_{i_1<i_2<\cdots<i_s} s_{\mathrm{j}(\mathbf{j}_1)}^n s_{\mathrm{j}(\mathbf{j}_2)}^n\cdots s_{\mathrm{j}(\mathbf{j}_s)}^n.
\end{aligned} \tag{13.173.17}$$

the element $e_s^{\langle n\rangle}$ of Λ, we conclude that $e_s^{\langle n\rangle}$ can be written as a polynomial in the elements $e_1, e_2, e_3, \ldots$. In other words, there exists a polynomial $Q \in \mathbf{k}[z_1, z_2, z_3, \ldots]$ such that $e_s^{\langle n\rangle} = Q(e_1, e_2, e_3, \ldots)$. Consider this polynomial Q.

Let us now define a map $\Phi : \Lambda \to \mathbf{k}[[\mathbf{x}]]$ by

$$\Phi(f) = f\left(\left(\mathbf{x}_{\mathbf{i}}^{\alpha}\right)_{\mathbf{i}\in\operatorname{SIS}(\ell)}\right) \qquad \text{for every } f \in \Lambda$$

(where $f\left(\left(\mathbf{x}_{\mathbf{i}}^{\alpha}\right)_{\mathbf{i}\in\operatorname{SIS}(\ell)}\right)$ is defined as in Definition 6.5.1(b)). This map Φ is a $\mathbf{k}$-algebra homomorphism (since it amounts to a substitution of certain elements for the variables in a power series). Therefore, it commutes with polynomials, i.e., it satisfies

$$\Phi(R(f_1, f_2, f_3, \ldots)) = R(\Phi(f_1), \Phi(f_2), \Phi(f_3), \ldots)$$

On the other hand, $e_s\left(\left(\mathbf{s}_{\mathbf{i}}^n\right)_{\mathbf{i}\in\mathbf{I}}\right)$ is the result of substituting $s_{\mathrm{j}(1)}^n$, $s_{\mathrm{j}(2)}^n$, $s_{\mathrm{j}(3)}^n$, $\ldots$ for the variables x_1, x_2, x_3, $\ldots$ in e_s (by the definition of $e_s\left(\left(s_{\mathbf{i}}^n\right)_{\mathbf{i}\in\mathbf{I}}\right)$). Thus,

$$\begin{aligned}
&e_s\left(\left(\mathbf{s}_{\mathbf{i}}^n\right)_{\mathbf{i}\in\mathbf{I}}\right)\\
&= \left(\text{the result of substituting } s_{\mathrm{j}(1)}^n,\ s_{\mathrm{j}(2)}^n,\ s_{\mathrm{j}(3)}^n,\ \ldots \text{ for the variables } x_1,\ x_2,\ x_3,\ \ldots \text{ in } \underbrace{e_s}_{=\sum_{i_1<i_2<\cdots<i_s} x_{i_1}x_{i_2}\cdots x_{i_s}}\right)\\
&= \left(\text{the result of substituting } s_{\mathrm{j}(1)}^n,\ s_{\mathrm{j}(2)}^n,\ s_{\mathrm{j}(3)}^n,\ \ldots \text{ for the variables } x_1,\ x_2,\ x_3,\ \ldots \text{ in } \sum_{i_1<i_2<\cdots<i_s} x_{i_1}x_{i_2}\cdots x_{i_s}\right)\\
&= \sum_{i_1<i_2<\cdots<i_s} s_{\mathrm{j}(\mathbf{j}_1)}^n s_{\mathrm{j}(\mathbf{j}_2)}^n \cdots s_{\mathrm{j}(\mathbf{j}_s)}^n.
\end{aligned}$$

Compared with (13.173.17), this yields $e_s^{\langle n\rangle}\left((\mathbf{s}_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}}\right) = e_s\left(\left(\mathbf{s}_{\mathbf{i}}^n\right)_{\mathbf{i}\in\mathbf{I}}\right)$. Thus, (13.173.16) is proven in Case 1.

Let us now consider Case 2. In this case, the set $\mathbf{I}$ is finite. Fix a bijection $\mathrm{j} : \{1, 2, \ldots, |\mathbf{I}|\} \to \mathbf{I}$ (such a bijection clearly exists, since $\mathbf{I}$ is finite).

Define an infinite sequence $(t_1, t_2, t_3, \ldots)$ of elements of R by

$$(t_1, t_2, t_3, \ldots) = \left(s_{\mathrm{j}(1)}, s_{\mathrm{j}(2)}, \ldots, s_{\mathrm{j}(|\mathbf{I}|)}, 0, 0, 0, \ldots\right). \tag{13.173.18}$$

Then,

$$(t_1^n, t_2^n, t_3^n, \ldots) = \left(s_{\mathrm{j}(1)}^n, s_{\mathrm{j}(2)}^n, \ldots, s_{\mathrm{j}(|\mathbf{I}|)}^n, \underbrace{0^n, 0^n, 0^n, \ldots}_{\substack{=(0,0,0,\ldots)\\ (\text{since } 0^n=0 \text{ (since } n \text{ is positive))}}}\right) = \left(s_{\mathrm{j}(1)}^n, s_{\mathrm{j}(2)}^n, \ldots, s_{\mathrm{j}(|\mathbf{I}|)}^n, 0, 0, 0, \ldots\right). \tag{13.173.19}$$

Recall that $e_s^{\langle n\rangle}\left((\mathbf{s}_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}}\right)$ is the result of substituting $s_{\mathrm{j}(1)}$, $s_{\mathrm{j}(2)}$, $\ldots$, $s_{\mathrm{j}(|\mathbf{I}|)}$, 0, 0, 0, $\ldots$ for the variables x_1, x_2, x_3, $\ldots$ in $e_s^{\langle n\rangle}$ (by the definition of $e_s^{\langle n\rangle}\left((s_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}}\right)$). Thus,

$$\begin{aligned}
&e_s^{\langle n\rangle}\left((s_{\mathbf{i}})_{\mathbf{i}\in\mathbf{I}}\right)\\
&= \left(\text{the result of substituting } \underbrace{s_{\mathrm{j}(1)},\ s_{\mathrm{j}(2)},\ \ldots,\ s_{\mathrm{j}(|\mathbf{I}|)},\ 0,\ 0,\ 0,\ \ldots}_{\substack{=(t_1,t_2,t_3,\ldots)\\ (\text{by } (13.173.18))}} \text{ for the variables } x_1,\ x_2,\ x_3,\ \ldots \text{ in } e_s^{\langle n\rangle}\right)\\
&= \left(\text{the result of substituting } t_1,\ t_2,\ t_3,\ \ldots \text{ for the variables } x_1,\ x_2,\ x_3,\ \ldots \text{ in } \underbrace{e_s^{\langle n\rangle}}_{=\sum_{i_1<i_2<\cdots<i_s} x_{i_1}^n x_{i_2}^n\cdots x_{i_s}^n}\right)\\
&= \left(\text{the result of substituting } t_1,\ t_2,\ t_3,\ \ldots \text{ for the variables } x_1,\ x_2,\ x_3,\ \ldots \text{ in } \sum_{i_1<i_2<\cdots<i_s} x_{i_1}^n x_{i_2}^n\cdots x_{i_s}^n\right)\\
&= \sum_{i_1<i_2<\cdots<i_s} t_{i_1}^n t_{i_2}^n \cdots t_{i_s}^n. \qquad (13.173.20)
\end{aligned}$$

for every $f_1, f_2, f_3, \ldots \in \Lambda$ and every polynomial $R \in \mathbf{k}[z_1, z_2, z_3, \ldots]$. Applying this to $f_i = e_i$ and $R = Q$, we obtain

$$\Phi\left(Q\left(e_1, e_2, e_3, \ldots\right)\right) = Q\left(\Phi\left(e_1\right), \Phi\left(e_2\right), \Phi\left(e_3\right), \ldots\right). \tag{13.173.21}$$

However, for every $j \in \{1, 2, 3, \ldots\}$, we have

$$\begin{aligned}\Phi\left(e_j\right) &= e_j\left(\left(\mathbf{x}_{\mathbf{i}}^{\alpha}\right)_{\mathbf{i}\in\operatorname{SIS}(\ell)}\right) && \left(\text{by the definition of } \Phi\left(e_j\right)\right)\\ &= M_{\alpha}^{\langle j\rangle} && \left(\text{since } M_{\alpha}^{\langle j\rangle} = e_j\left(\left(\mathbf{x}_{\mathbf{i}}^{\alpha}\right)_{\mathbf{i}\in\operatorname{SIS}(\ell)}\right) \text{ (by the definition of } M_{\alpha}^{\langle j\rangle}\text{)}\right).\end{aligned}$$

Thus, $\left(\Phi\left(e_1\right), \Phi\left(e_2\right), \Phi\left(e_3\right), \ldots\right) = \left(M_{\alpha}^{\langle 1\rangle}, M_{\alpha}^{\langle 2\rangle}, M_{\alpha}^{\langle 3\rangle}, \ldots\right)$, so that

$$Q\left(\Phi\left(e_1\right), \Phi\left(e_2\right), \Phi\left(e_3\right), \ldots\right) = Q\left(M_{\alpha}^{\langle 1\rangle}, M_{\alpha}^{\langle 2\rangle}, M_{\alpha}^{\langle 3\rangle}, \ldots\right).$$

Hence, (13.173.21) becomes

$$\Phi\left(Q\left(e_1, e_2, e_3, \ldots\right)\right) = Q\left(\Phi\left(e_1\right), \Phi\left(e_2\right), \Phi\left(e_3\right), \ldots\right) = Q\left(M_{\alpha}^{\langle 1\rangle}, M_{\alpha}^{\langle 2\rangle}, M_{\alpha}^{\langle 3\rangle}, \ldots\right).$$

Compared with

$$\begin{aligned}\Phi\left(\underbrace{Q\left(e_1, e_2, e_3, \ldots\right)}_{\substack{= e_s^{\langle n\rangle} \\ \left(\text{since } e_s^{\langle n\rangle} = Q(e_1, e_2, e_3, \ldots)\right)}}\right) &= \Phi\left(e_s^{\langle n\rangle}\right) = e_s^{\langle n\rangle}\left(\left(\mathbf{x}_{\mathbf{i}}^{\alpha}\right)_{\mathbf{i}\in\operatorname{SIS}(\ell)}\right) && \left(\text{by the definition of } \Phi\left(e_s^{\langle n\rangle}\right)\right)\\ &= M_{\alpha\{n\}}^{\langle s\rangle} && \left(\text{by Exercise 6.5.4(c)}\right),\end{aligned}$$

this yields $M_{\alpha\{n\}}^{\langle s\rangle} = Q\left(M_{\alpha}^{\langle 1\rangle}, M_{\alpha}^{\langle 2\rangle}, M_{\alpha}^{\langle 3\rangle}, \ldots\right)$. Thus, there exists a polynomial $P \in \mathbf{k}[z_1, z_2, z_3, \ldots]$ such that $M_{\alpha\{n\}}^{\langle s\rangle} = P\left(M_{\alpha}^{\langle 1\rangle}, M_{\alpha}^{\langle 2\rangle}, M_{\alpha}^{\langle 3\rangle}, \ldots\right)$ (namely, $P = Q$). This solves Exercise 6.5.4(d).

On the other hand, $e_s\left(\left(\mathbf{s}_{\mathbf{i}}^n\right)_{\mathbf{i}\in\mathbf{I}}\right)$ is the result of substituting $s_{\mathbf{j}(1)}^n$, $s_{\mathbf{j}(2)}^n$, $\ldots$, $s_{\mathbf{j}(|\mathbf{I}|)}^n$, 0, 0, 0, $\ldots$ for the variables x_1, x_2, x_3, $\ldots$ in e_s (by the definition of $e_s\left(\left(s_{\mathbf{i}}^n\right)_{\mathbf{i}\in\mathbf{I}}\right)$). Thus,

$$\begin{aligned}&e_s\left(\left(\mathbf{s}_{\mathbf{i}}^n\right)_{\mathbf{i}\in\mathbf{I}}\right)\\ &= \left(\text{the result of substituting } \underbrace{s_{\mathbf{j}(1)}^n,\ s_{\mathbf{j}(2)}^n,\ \ldots,\ s_{\mathbf{j}(|\mathbf{I}|)}^n,\ 0,\ 0,\ 0,\ \ldots}_{\substack{=\left(t_1^n, t_2^n, t_3^n, \ldots\right) \\ \text{(by (13.173.19))}}} \text{ for the variables } x_1,\ x_2,\ x_3,\ \ldots \text{ in } e_s\right)\\ &= \left(\text{the result of substituting } t_1^n,\ t_2^n,\ t_3^n,\ \ldots \text{ for the variables } x_1,\ x_2,\ x_3,\ \ldots \text{ in } \underbrace{e_s}_{=\sum_{i_1<i_2<\cdots<i_s} x_{i_1}x_{i_2}\cdots x_{i_s}}\right)\\ &= \left(\text{the result of substituting } t_1^n,\ t_2^n,\ t_3^n,\ \ldots \text{ for the variables } x_1,\ x_2,\ x_3,\ \ldots \text{ in } \sum_{i_1<i_2<\cdots<i_s} x_{i_1}x_{i_2}\cdots x_{i_s}\right)\\ &= \sum_{i_1<i_2<\cdots<i_s} t_{i_1}^n t_{i_2}^n \cdots t_{i_s}^n.\end{aligned}$$

Compared with (13.173.20), this yields $e_s^{\langle n\rangle}\left(\left(\mathbf{s}_{\mathbf{i}}\right)_{\mathbf{i}\in\mathbf{I}}\right) = e_s\left(\left(\mathbf{s}_{\mathbf{i}}^n\right)_{\mathbf{i}\in\mathbf{I}}\right)$. Thus, (13.173.16) is proven in Case 2.

We have thus proven (13.173.16) in each of the Cases 1 and 2. Since these two Cases are the only cases that can occur, we thus conclude that (13.173.16) holds, qed.

13.174. **Solution to Exercise 6.5.5.** *Solution to Exercise 6.5.5.* The definition of $M_{(1)}^{\langle s\rangle}$ yields $M_{(1)}^{\langle s\rangle} = e_s\left(\left(\mathbf{x}_{\mathbf{i}}^{(1)}\right)_{\mathbf{i}\in\operatorname{SIS}(1)}\right)$.

But $\operatorname{SIS}(1)$ is defined as the set of all strictly increasing 1-tuples of positive integers. Clearly, such 1-tuples are in bijection with positive integers; the bijection sends a positive integer i to the strictly increasing 1-tuple (i). This bijection shows that the family $\left(\mathbf{x}_{\mathbf{i}}^{(1)}\right)_{\mathbf{i}\in\operatorname{SIS}(1)}$ is a reparametrization of the family $\left(\mathbf{x}_{(i)}^{(1)}\right)_{i\in\{1,2,3,\ldots\}}$. Thus, $e_s\left(\left(\mathbf{x}_{\mathbf{i}}^{(1)}\right)_{\mathbf{i}\in\operatorname{SIS}(1)}\right) = e_s\left(\left(\mathbf{x}_{(i)}^{(1)}\right)_{i\in\{1,2,3,\ldots\}}\right)$. Thus,

$$M_{(1)}^{\langle s\rangle} = e_s\left(\left(\mathbf{x}_{\mathbf{i}}^{(1)}\right)_{\mathbf{i}\in\operatorname{SIS}(1)}\right) = e_s\left(\left(\underbrace{\mathbf{x}_{(i)}^{(1)}}_{\substack{=x_i^1 \\ \text{(by the definition} \\ \text{of } \mathbf{x}_{(i)}^{(1)})}}\right)_{i\in\{1,2,3,\ldots\}}\right) = e_s\left(\left(\underbrace{x_i^1}_{=x_i}\right)_{i\in\{1,2,3,\ldots\}}\right)$$
$$= e_s\left((x_i)_{i\in\{1,2,3,\ldots\}}\right) = e_s.$$

This solves Exercise 6.5.5.

13.175. **Solution to Exercise 6.5.7.** *Solution to Exercise 6.5.7.*

Proof of Proposition 6.5.6. We first recall a general fact from algebra. Namely, if $\mathfrak{C}$ and $\mathfrak{D}$ are two commutative rings, if $\varphi : \mathfrak{C} \to \mathfrak{D}$ is a ring homomorphism, and if u and v are two nonnegative integers, then we can define a homomorphism $\varphi^{u\times v} : \mathfrak{C}^{u\times v} \to \mathfrak{D}^{u\times v}$ of additive groups by sending every matrix $(c_{i,j})_{i=1,2,\ldots,u;\ j=1,2,\ldots,v} \in \mathfrak{C}^{u\times v}$ to the matrix $(\varphi(c_{i,j}))_{i=1,2,\ldots,u;\ j=1,2,\ldots,v} \in \mathfrak{D}^{u\times v}$. This homomorphism $\varphi^{u\times v}$ is the map from $\mathfrak{C}^{u\times v}$ to $\mathfrak{D}^{u\times v}$ canonically induced by φ, and it has many structure-preserving properties (for instance, it respects the multiplication of matrices, in the sense that we have $\varphi^{u\times v}(X)\cdot\varphi^{v\times w}(Y) = \varphi^{u\times w}(XY)$ whenever $X \in \mathfrak{C}^{u\times v}$ and $Y \in \mathfrak{C}^{v\times w}$). We furthermore have

$$\det\left(\varphi^{u\times u}(X)\right) = \varphi(\det X) \tag{13.175.1}$$

for any two commutative rings $\mathfrak{C}$ and $\mathfrak{D}$, any ring homomorphism $\varphi : \mathfrak{C} \to \mathfrak{D}$, any nonnegative integer u and any matrix $X \in \mathfrak{C}^{u\times u}$. (This is because the determinant of a matrix is a polynomial in its entries, and polynomials commute with ring homomorphisms.)

We shall now construct a particular $\mathbf{k}$-algebra homomorphism $\Lambda \to \mathbf{k}[[\mathbf{x}]]$ which will help us in our proof. Namely, we define a map $\Phi : \Lambda \to \mathbf{k}[[\mathbf{x}]]$ by

$$\Phi(f) = f\left((\mathbf{x}_{\mathbf{i}}^{\alpha})_{\mathbf{i}\in\operatorname{SIS}(\ell)}\right) \qquad \text{for every } f \in \Lambda$$

(where $f\left((\mathbf{x}_{\mathbf{i}}^{\alpha})_{\mathbf{i}\in\operatorname{SIS}(\ell)}\right)$ is defined as in Definition 6.5.1(b)). This map Φ is a $\mathbf{k}$-algebra homomorphism (since it amounts to a substitution of certain elements for the variables in a power series). Every $s \in \mathbb{N}$ satisfies

$$\begin{aligned} \Phi(e_s) &= e_s\left((\mathbf{x}_{\mathbf{i}}^{\alpha})_{\mathbf{i}\in\operatorname{SIS}(\ell)}\right) && \text{(by the definition of } \Phi(e_s)) \\ &= M_{\alpha}^{\langle s\rangle} && \left(\text{since } M_{\alpha}^{\langle s\rangle} \text{ was defined as } e_s\left((\mathbf{x}_{\mathbf{i}}^{\alpha})_{\mathbf{i}\in\operatorname{SIS}(\ell)}\right)\right). \end{aligned} \tag{13.175.2}$$

Every positive integer s satisfies

$$\begin{aligned} \Phi(p_s) &= p_s\left((\mathbf{x}_{\mathbf{i}}^{\alpha})_{\mathbf{i}\in\operatorname{SIS}(\ell)}\right) && \text{(by the definition of } \Phi(p_s)) \\ &= M_{\alpha\{s\}} && \text{(by Exercise 6.5.4(a))}. \end{aligned} \tag{13.175.3}$$

(a) Define a matrix $A_n = (a_{i,j})_{i,j=1,2,\ldots,n}$ as in Exercise 2.9.13(a). Then, Exercise 2.9.13(a) yields $\det(A_n) = n!e_n$. Applying the map Φ to both sides of this equality, we obtain

$$\Phi(\det(A_n)) = \Phi(n!e_n) = n! \underbrace{\Phi(e_n)}_{\substack{=M_\alpha^{\langle n\rangle} \\ \text{(by (13.175.2), applied} \\ \text{to } s=n)}} = n!M_\alpha^{\langle n\rangle}.$$

But (13.175.1) (applied to $\mathfrak{C} = \Lambda$, $\mathfrak{D} = \mathbf{k}[[\mathbf{x}]]$, $\varphi = \Phi$, $u = n$ and $X = A_n$) yields

$$\det\left(\Phi^{n\times n}(A_n)\right) = \Phi(\det(A_n)) = n!M_\alpha^{\langle n\rangle}. \tag{13.175.4}$$

But

$$\Phi^{n\times n}\left(\underbrace{A_n}_{=(a_{i,j})_{i,j=1,2,\ldots,n}}\right) = \Phi^{n\times n}\left((a_{i,j})_{i,j=1,2,\ldots,n}\right) = (\Phi(a_{i,j}))_{i,j=1,2,\ldots,n} \tag{13.175.5}$$

(by the definition of $\Phi^{n\times n}\left((a_{i,j})_{i,j=1,2,\ldots,n}\right)$). But every $(i,j) \in \{1,2,\ldots,n\}^2$ satisfies

$$\begin{aligned}
\Phi(a_{i,j}) &= \Phi\left(\begin{cases} p_{i-j+1}, & \text{if } i \geq j; \\ i, & \text{if } i = j-1; \\ 0, & \text{if } i < j-1 \end{cases}\right) \qquad \left(\text{since } a_{i,j} = \begin{cases} p_{i-j+1}, & \text{if } i \geq j; \\ i, & \text{if } i = j-1; \\ 0, & \text{if } i < j-1 \end{cases}\right) \\
&= \begin{cases} \Phi(p_{i-j+1}), & \text{if } i \geq j; \\ \Phi(i), & \text{if } i = j-1; \\ \Phi(0), & \text{if } i < j-1 \end{cases} = \begin{cases} \Phi(p_{i-j+1}), & \text{if } i \geq j; \\ i, & \text{if } i = j-1; \\ 0, & \text{if } i < j-1 \end{cases} \\
&\qquad \left(\begin{array}{c} \text{since } \Phi(i) = i \text{ in the case when } i = j-1 \text{ (because } \Phi \text{ is a} \\ \mathbf{k}\text{-algebra homomorphism), and because } \Phi(0) = 0 \text{ in the} \\ \text{case when } i < j-1 \text{ (for the same reason)} \end{array}\right) \\
&= \begin{cases} M_{\alpha\{i-j+1\}}, & \text{if } i \geq j; \\ i, & \text{if } i = j-1; \\ 0, & \text{if } i < j-1 \end{cases} \\
&\qquad \left(\begin{array}{c} \text{since } \Phi(p_{i-j+1}) = M_{\alpha\{i-j+1\}} \text{ in the case when } i \geq j \\ \text{(by (13.175.3), applied to } s = i-j+1) \end{array}\right) \\
&= a_{i,j}^{\langle\alpha\rangle} \qquad \left(\text{since } a_{i,j}^{\langle\alpha\rangle} = \begin{cases} M_{\alpha\{i-j+1\}}, & \text{if } i \geq j; \\ i, & \text{if } i = j-1; \\ 0, & \text{if } i < j-1 \end{cases}\right).
\end{aligned}$$

Hence, $\left(\underbrace{\Phi(a_{i,j})}_{=a_{i,j}^{\langle\alpha\rangle}}\right)_{i,j=1,2,\ldots,n} = \left(a_{i,j}^{\langle\alpha\rangle}\right)_{i,j=1,2,\ldots,n} = A_n^{\langle\alpha\rangle}$. Thus, (13.175.5) becomes

$$\Phi^{n\times n}(A_n) = (\Phi(a_{i,j}))_{i,j=1,2,\ldots,n} = A_n^{\langle\alpha\rangle}.$$

Thus, (13.175.4) rewrites as $\det\left(A_n^{\langle\alpha\rangle}\right) = n!M_\alpha^{\langle n\rangle}$. This proves Proposition 6.5.6(a).

(b) The proof of Proposition 6.5.6(b) proceeds similarly to our proof of Proposition 6.5.6(a) above, as long as the obvious changes are made (one needs to consider B_n, $b_{i,j}$, $B_n^{\langle\alpha\rangle}$ and $b_{i,j}^{\langle\alpha\rangle}$ instead of A_n, $a_{i,j}$, $A_n^{\langle\alpha\rangle}$ and $a_{i,j}^{\langle\alpha\rangle}$). □

13.176. **Solution to Exercise 6.5.9.** *Solution to Exercise 6.5.9.*

Proof of Corollary 6.5.8. (a) We WLOG assume that $s \in \mathbb{N}$ (because otherwise, s is negative and thus satisfies $M_\alpha^{\langle s\rangle} = 0 \in \operatorname{QSym}$).

Define a matrix $A_s^{\langle\alpha\rangle} = \left(a_{i,j}^{\langle\alpha\rangle}\right)_{i,j=1,2,\ldots,s}$ as in Proposition 6.5.6(a) (but for s instead of n). Then, $A_s^{\langle\alpha\rangle} \in \operatorname{QSym}^{s\times s}$ (since every $(i,j) \in \{1,2,\ldots,s\}^2$ satisfies $a_{i,j}^{\langle\alpha\rangle} \in \operatorname{QSym}$ (as follows from the definition of $a_{i,j}^{\langle\alpha\rangle}$)). Hence, $\det\left(A_s^{\langle\alpha\rangle}\right) \in \operatorname{QSym}$. But Proposition 6.5.6(a) (applied to $n = s$) yields $\det\left(A_s^{\langle\alpha\rangle}\right) = s!M_\alpha^{\langle s\rangle}$. Hence, $s!M_\alpha^{\langle s\rangle} = \det\left(A_s^{\langle\alpha\rangle}\right) \in \operatorname{QSym}$.

Now, let us recall that there is a canonical ring homomorphism $\varphi : \mathbb{Z} \to \mathbf{k}$. This homomorphism gives rise to a ring homomorphism $\varphi[[\mathbf{x}]] : \mathbb{Z}[[\mathbf{x}]] \to \mathbf{k}[[\mathbf{x}]]$, and this latter homomorphism $\varphi[[\mathbf{x}]]$ sends $\operatorname{QSym}_{\mathbb{Z}}$ to $\operatorname{QSym}_{\mathbf{k}}$; that is, we have $(\varphi[[\mathbf{x}]])(\operatorname{QSym}_{\mathbb{Z}}) \subset \operatorname{QSym}_{\mathbf{k}}$. Moreover, it is clear that the ring homomorphism $\varphi[[\mathbf{x}]]$ sends the element $M_\alpha^{\langle s\rangle}$ of $\mathbb{Z}[[\mathbf{x}]]$ to the element $M_\alpha^{\langle s\rangle}$ of $\mathbf{k}[[\mathbf{x}]]$ (because the definition of $M_\alpha^{\langle s\rangle}$ is functorial in the base ring $\mathbf{k}$). Therefore, if we can prove that the element $M_\alpha^{\langle s\rangle}$ of $\mathbb{Z}[[\mathbf{x}]]$ belongs to $\operatorname{QSym}_{\mathbb{Z}}$, then it will automatically follow that the element $M_\alpha^{\langle s\rangle}$ of $\mathbf{k}[[\mathbf{x}]]$ belongs to $(\varphi[[\mathbf{x}]])(\operatorname{QSym}_{\mathbb{Z}}) \subset \operatorname{QSym}_{\mathbf{k}}$; this will complete the proof of Corollary 6.5.8(a). Hence, in order to prove Corollary 6.5.8(a), it only remains to prove that the element $M_\alpha^{\langle s\rangle}$ of $\mathbb{Z}[[\mathbf{x}]]$ belongs to $\operatorname{QSym}_{\mathbb{Z}}$. In other words, it only remains to prove Corollary 6.5.8(a) in the case of $\mathbf{k} = \mathbb{Z}$. Hence, in proving Corollary 6.5.8(a), we can WLOG assume that $\mathbf{k} = \mathbb{Z}$. Assume this. Since $\mathbf{k} = \mathbb{Z}$, we have $\operatorname{QSym} = \operatorname{QSym}_{\mathbb{Z}}$.

If a positive integer N and an element f of $\mathbb{Z}[[\mathbf{x}]]$ satisfy $Nf \in \operatorname{QSym}_{\mathbb{Z}}$, then f also lies in $\operatorname{QSym}_{\mathbb{Z}}$ (because N is not a zero-divisor in $\mathbf{k} = \mathbb{Z}$, and therefore f is obtained from the power series Nf by dividing all coefficients by N). Applying this to $N = s!$ and $f = M_\alpha^{\langle s\rangle}$, we obtain $M_\alpha^{\langle s\rangle} \in \operatorname{QSym}_{\mathbb{Z}}$ (since $s!M_\alpha^{\langle s\rangle} \in \operatorname{QSym} = \operatorname{QSym}_{\mathbb{Z}}$). In other words, $M_\alpha^{\langle s\rangle} \in \operatorname{QSym}$ (since $\mathbf{k} = \mathbb{Z}$). This completes the proof of Corollary 6.5.8(a).

(b) Recall that $M_\alpha^{\langle s\rangle} = e_s\left(\left(\mathbf{x}_{\mathbf{i}}^\alpha\right)_{\mathbf{i}\in\operatorname{SIS}(\ell)}\right)$. Thus, $M_\alpha^{\langle s\rangle}$ is a homogeneous power series of degree $s|\alpha|$ (since each $\mathbf{x}_{\mathbf{i}}^\alpha$ is a monomial of degree $|\alpha|$, and since e_s is a power series of degree s). Combined with $M_\alpha^{\langle s\rangle} \in \operatorname{QSym}$ (which follows from Corollary 6.5.8(a)), this yields $M_\alpha^{\langle s\rangle} \in \operatorname{QSym}_{s|\alpha|}$. This proves Corollary 6.5.8(b). □

13.177. **Solution to Exercise 6.5.12.** *Solution to Exercise 6.5.12.*

Proof of Remark 6.5.11. (a) Write the composition α in the form $(\alpha_1, \alpha_2, \ldots, \alpha_\ell)$. Then, $\operatorname{red}\alpha = \left(\frac{\alpha_1}{\gcd\alpha}, \frac{\alpha_2}{\gcd\alpha}, \ldots, \frac{\alpha_\ell}{\gcd\alpha}\right)$ (by the definition of $\operatorname{red}\alpha$). Hence, the definition of $(\operatorname{red}\alpha)\{\gcd\alpha\}$ yields

$$(\operatorname{red}\alpha)\{\gcd\alpha\} = \left((\gcd\alpha)\cdot\frac{\alpha_1}{\gcd\alpha}, (\gcd\alpha)\cdot\frac{\alpha_2}{\gcd\alpha}, \ldots, (\gcd\alpha)\cdot\frac{\alpha_\ell}{\gcd\alpha}\right) = (\alpha_1, \alpha_2, \ldots, \alpha_\ell) = \alpha,$$

so that Remark 6.5.11(a) is proven.

(c) Write the composition α in the form $(\alpha_1, \alpha_2, \ldots, \alpha_\ell)$. Then, $\operatorname{red}\alpha = \left(\frac{\alpha_1}{\gcd\alpha}, \frac{\alpha_2}{\gcd\alpha}, \ldots, \frac{\alpha_\ell}{\gcd\alpha}\right)$ (by the definition of $\operatorname{red}\alpha$). Hence, the definition of $\gcd(\operatorname{red}\alpha)$ yields

$$\begin{aligned}\gcd(\operatorname{red}\alpha) = \gcd\left(\frac{\alpha_1}{\gcd\alpha}, \frac{\alpha_2}{\gcd\alpha}, \ldots, \frac{\alpha_\ell}{\gcd\alpha}\right) &= \frac{\gcd(\alpha_1, \alpha_2, \ldots, \alpha_\ell)}{\gcd\alpha} = \frac{\gcd(\alpha_1, \alpha_2, \ldots, \alpha_\ell)}{\gcd(\alpha_1, \alpha_2, \ldots, \alpha_\ell)} \\ &\qquad \left(\text{since } \gcd\alpha = \gcd(\alpha_1, \alpha_2, \ldots, \alpha_\ell) \text{ (by the definition of } \gcd\alpha)\right) \\ &= 1.\end{aligned}$$

In other words, the composition $\operatorname{red}\alpha$ is reduced. This proves Remark 6.5.11(c).

(d) Assume that α is reduced. Write the composition α in the form $(\alpha_1, \alpha_2, \ldots, \alpha_\ell)$. Then, $\operatorname{red}\alpha = \left(\frac{\alpha_1}{\gcd\alpha}, \frac{\alpha_2}{\gcd\alpha}, \ldots, \frac{\alpha_\ell}{\gcd\alpha}\right)$ (by the definition of $\operatorname{red}\alpha$). But $\gcd\alpha = 1$ (since α is reduced). Now,

$$\begin{aligned}\operatorname{red}\alpha &= \left(\frac{\alpha_1}{\gcd\alpha}, \frac{\alpha_2}{\gcd\alpha}, \ldots, \frac{\alpha_\ell}{\gcd\alpha}\right) = \left(\frac{\alpha_1}{1}, \frac{\alpha_2}{1}, \ldots, \frac{\alpha_\ell}{1}\right) \qquad (\text{since } \gcd\alpha = 1)\\ &= (\alpha_1, \alpha_2, \ldots, \alpha_\ell) = \alpha.\end{aligned}$$

This proves Remark 6.5.11(d).

(e) Let $s \in \{1, 2, 3, \ldots\}$. Write the composition α in the form $(\alpha_1, \alpha_2, \ldots, \alpha_\ell)$. Then, $\operatorname{red}\alpha = \left(\frac{\alpha_1}{\gcd\alpha}, \frac{\alpha_2}{\gcd\alpha}, \ldots, \frac{\alpha_\ell}{\gcd\alpha}\right)$ (by the definition of $\operatorname{red}\alpha$). Also, $\alpha\{s\} = (s\alpha_1, s\alpha_2, \ldots, s\alpha_\ell)$ (by the definition of $\alpha\{s\}$). Now, $\alpha = (\alpha_1, \alpha_2, \ldots, \alpha_\ell)$, so that $\ell(\alpha) = \ell$. Hence, $\ell = \ell(\alpha) > 0$ (since α is nonempty). Since $\alpha\{s\} = (s\alpha_1, s\alpha_2, \ldots, s\alpha_\ell)$, we have $\ell(\alpha\{s\}) = \ell > 0$, so that the composition $\alpha\{s\}$ is nonempty.

By the definition of $\gcd\alpha$, we have $\gcd\alpha = \gcd(\alpha_1, \alpha_2, \ldots, \alpha_\ell)$. By the definition of $\gcd(\alpha\{s\})$, we have

$$\begin{aligned}\gcd(\alpha\{s\}) &= \gcd(s\alpha_1, s\alpha_2, \ldots, s\alpha_\ell) \qquad (\text{since } \alpha\{s\} = (s\alpha_1, s\alpha_2, \ldots, s\alpha_\ell))\\ &= s\underbrace{\gcd(\alpha_1, \alpha_2, \ldots, \alpha_\ell)}_{=\gcd\alpha} = s\gcd\alpha.\end{aligned}$$

Now, recall that $\alpha\{s\} = (s\alpha_1, s\alpha_2, \ldots, s\alpha_\ell)$. Hence, the definition of $\operatorname{red}(\alpha\{s\})$ yields

$$\begin{aligned}\operatorname{red}(\alpha\{s\}) &= \left(\frac{s\alpha_1}{\gcd(\alpha\{s\})}, \frac{s\alpha_2}{\gcd(\alpha\{s\})}, \ldots, \frac{s\alpha_\ell}{\gcd(\alpha\{s\})}\right)\\ &= \left(\frac{s\alpha_1}{s\gcd\alpha}, \frac{s\alpha_2}{s\gcd\alpha}, \ldots, \frac{s\alpha_\ell}{s\gcd\alpha}\right) \qquad (\text{since } \gcd(\alpha\{s\}) = s\gcd\alpha)\\ &= \left(\frac{\alpha_1}{\gcd\alpha}, \frac{\alpha_2}{\gcd\alpha}, \ldots, \frac{\alpha_\ell}{\gcd\alpha}\right) = \operatorname{red}\alpha.\end{aligned}$$

This proves Remark 6.5.11(e).

(f) Write the composition α in the form $(\alpha_1, \alpha_2, \ldots, \alpha_\ell)$. Then, $\operatorname{red}\alpha = \left(\frac{\alpha_1}{\gcd\alpha}, \frac{\alpha_2}{\gcd\alpha}, \ldots, \frac{\alpha_\ell}{\gcd\alpha}\right)$ (by the definition of $\operatorname{red}\alpha$). Thus,

$$|\operatorname{red}\alpha| = \frac{\alpha_1}{\gcd\alpha} + \frac{\alpha_2}{\gcd\alpha} + \cdots + \frac{\alpha_\ell}{\gcd\alpha} = \frac{\alpha_1 + \alpha_2 + \cdots + \alpha_\ell}{\gcd\alpha},$$

so that $(\gcd\alpha)|\operatorname{red}\alpha| = \alpha_1 + \alpha_2 + \cdots + \alpha_\ell = |\alpha|$ (since $|\alpha| = \alpha_1 + \alpha_2 + \cdots + \alpha_\ell$ (because $\alpha = (\alpha_1, \alpha_2, \ldots, \alpha_\ell)$)). This proves Remark 6.5.11(f).

(b) We have $(\operatorname{red}\alpha)\{\gcd\alpha\} = \alpha$ (by Remark 6.5.11(a)).

The property of a composition to be Lyndon does not change if all entries of the composition are multiplied by a fixed positive integer m (because this property only depends on the relative order of the parts of the composition). In other words, if β is a composition and m is a positive integer, then β is Lyndon if and only if $\beta\{m\}$ is Lyndon. Applying this to $\beta = \operatorname{red}\alpha$ and $m = \gcd\alpha$, we conclude that $\operatorname{red}\alpha$ is Lyndon if and only if $(\operatorname{red}\alpha)\{\gcd\alpha\}$ is Lyndon. In other words, $\operatorname{red}\alpha$ is Lyndon if and only if α is Lyndon (because $(\operatorname{red}\alpha)\{\gcd\alpha\} = \alpha$). This proves Remark 6.5.11(b). □

13.178. **Solution to Exercise 6.5.15.** *Solution to Exercise 6.5.15.*

Proof of Lemma 6.5.14. For every $\alpha \in \mathfrak{L}$, the pair $(\operatorname{red}\alpha, \gcd\alpha)$ is a well-defined element of $\mathfrak{RL} \times \{1, 2, 3, \ldots\}$ [1155]. Hence, we can define a map $\mathbf{R} : \mathfrak{L} \to \mathfrak{RL} \times \{1, 2, 3, \ldots\}$ by

$$(\mathbf{R}(\alpha) = (\operatorname{red}\alpha, \gcd\alpha) \qquad \text{for every } \alpha \in \mathfrak{L}).$$

Consider this $\mathbf{R}$.

For every $(w, s) \in \mathfrak{RL} \times \{1, 2, 3, \ldots\}$, the element $w\{s\}$ is a well-defined element of $\mathfrak{L}$ [1156]. Hence, we can define a map $\mathbf{M} : \mathfrak{RL} \times \{1, 2, 3, \ldots\} \to \mathfrak{L}$ by

$$(\mathbf{M}(w, s) = w\{s\} \qquad \text{for every } (w, s) \in \mathfrak{RL} \times \{1, 2, 3, \ldots\}).$$

Consider this $\mathbf{M}$.

It is now easy to see that $\mathbf{R} \circ \mathbf{M} = \operatorname{id}$ [1157] and $\mathbf{M} \circ \mathbf{R} = \operatorname{id}$ [1158]. Therefore, the maps $\mathbf{M}$ and $\mathbf{R}$ are mutually inverse. Hence, the map $\mathbf{M}$ is a bijection. Hence, the family $\left(M_{\operatorname{red}(\mathbf{M}(w,s))}^{\langle\gcd(\mathbf{M}(w,s))\rangle}\right)_{(w,s)\in\mathfrak{RL}\times\{1,2,3,\ldots\}}$ is a reindexing of the family $\left(M_{\operatorname{red}\alpha}^{\langle\gcd\alpha\rangle}\right)_{\alpha\in\mathfrak{L}}$. Since every $(w, s) \in \mathfrak{RL} \times \{1, 2, 3, \ldots\}$ satisfies

$$\gcd(\mathbf{M}(w, s)) = s \qquad \text{and} \qquad \operatorname{red}(\mathbf{M}(w, s)) = w$$

[1155] *Proof.* Let $\alpha \in \mathfrak{L}$. Then, α is a Lyndon word (since $\mathfrak{L}$ is the set of all Lyndon words), and thus nonempty. Hence, α is a nonempty composition, so that $\operatorname{red}\alpha$ is a well-defined composition, and $\gcd\alpha$ is a well-defined positive integer. Remark 6.5.11(b) yields that the composition α is Lyndon if and only if the composition $\operatorname{red}\alpha$ is Lyndon. Since α is Lyndon, this yields that $\operatorname{red}\alpha$ is Lyndon. Also, $\operatorname{red}\alpha$ is reduced (by Remark 6.5.11(c)). Thus, $\operatorname{red}\alpha$ is a reduced Lyndon composition. In other words, $\operatorname{red}\alpha \in \mathfrak{RL}$ (since $\mathfrak{RL}$ is the set of all reduced Lyndon compositions). Combined with $\gcd\alpha \in \{1, 2, 3, \ldots\}$ (since $\gcd\alpha$ is a well-defined positive integer), this yields $(\operatorname{red}\alpha, \gcd\alpha) \in \mathfrak{RL} \times \{1, 2, 3, \ldots\}$, qed.

[1156] *Proof.* Let $(w, s) \in \mathfrak{RL} \times \{1, 2, 3, \ldots\}$. Then, $w \in \mathfrak{RL}$ and $s \in \{1, 2, 3, \ldots\}$. Since $\mathfrak{RL}$ is the set of all reduced Lyndon compositions, we see that w is a reduced Lyndon composition (since $w \in \mathfrak{RL}$). Thus, w is nonempty (since w is Lyndon).

We shall now show that $w\{s\} \in \mathfrak{L}$.

Remark 6.5.11(e) (applied to $\alpha = w$) yields that the composition $w\{s\}$ is nonempty and satisfies $\operatorname{red}(w\{s\}) = \operatorname{red}w$ and $\gcd(w\{s\}) = s\gcd w$. We have $\operatorname{red}(w\{s\}) = \operatorname{red}w = w$ (by Remark 6.5.11(d), applied to $\alpha = w$). Now, recall that the composition w is Lyndon. Hence, the composition $\operatorname{red}(w\{s\})$ is Lyndon (since $\operatorname{red}(w\{s\}) = w$).

Remark 6.5.11(b) (applied to $\alpha = w\{s\}$) yields that the composition $w\{s\}$ is Lyndon if and only if the composition $\operatorname{red}(w\{s\})$ is Lyndon. Since the composition $\operatorname{red}(w\{s\})$ is Lyndon, this yields that the composition $w\{s\}$ is Lyndon. In other words, $w\{s\} \in \mathfrak{L}$ (since $\mathfrak{L}$ is the set of all Lyndon words), qed.

[1157] *Proof.* Let $(w, s) \in \mathfrak{RL} \times \{1, 2, 3, \ldots\}$. Thus, $w \in \mathfrak{RL}$ and $s \in \{1, 2, 3, \ldots\}$. Since $\mathfrak{RL}$ is the set of all reduced Lyndon compositions, we see that w is a reduced Lyndon composition (since $w \in \mathfrak{RL}$). Thus, w is nonempty (since w is Lyndon).

Remark 6.5.11(e) (applied to $\alpha = w$) yields that the composition $w\{s\}$ is nonempty and satisfies $\operatorname{red}(w\{s\}) = \operatorname{red}w$ and $\gcd(w\{s\}) = s\gcd w$. But $\gcd w = 1$ (since w is reduced), so that $\gcd(w\{s\}) = s\underbrace{\gcd w}_{=1} = s$. Also, $\operatorname{red}(w\{s\}) = \operatorname{red}w = w$ (by Remark 6.5.11(d), applied to $\alpha = w$). Now,

$$\begin{aligned}(\mathbf{R} \circ \mathbf{M})(w, s) &= \mathbf{R}\Bigg(\underbrace{\mathbf{M}(w, s)}_{\substack{=w\{s\} \\ \text{(by the definition of } \mathbf{M}(w,s))}}\Bigg) = \mathbf{R}(w\{s\}) = \Bigg(\underbrace{\operatorname{red}(w\{s\})}_{=w}, \underbrace{\gcd(w\{s\})}_{=s}\Bigg) \\ &\qquad \text{(by the definition of } \mathbf{R}(w\{s\})) \\ &= (w, s) = \operatorname{id}(w, s).\end{aligned}$$

Now, let us forget that we fixed (w, s). We thus have shown that $(\mathbf{R} \circ \mathbf{M})(w, s) = \operatorname{id}(w, s)$ for every $(w, s) \in \mathfrak{RL} \times \{1, 2, 3, \ldots\}$. In other words, $\mathbf{R} \circ \mathbf{M} = \operatorname{id}$, qed.

[1158] *Proof.* Let $\alpha \in \mathfrak{L}$. Then, α is a Lyndon word (since $\mathfrak{L}$ is the set of all Lyndon words), and thus nonempty. Hence, α is a nonempty composition. Now,

$$\begin{aligned}(\mathbf{M} \circ \mathbf{R})(\alpha) &= \mathbf{M}\Bigg(\underbrace{\mathbf{R}(\alpha)}_{\substack{=(\operatorname{red}\alpha, \gcd\alpha) \\ \text{(by the definition of } \mathbf{R}(\alpha))}}\Bigg) = \mathbf{M}(\operatorname{red}\alpha, \gcd\alpha) = (\operatorname{red}\alpha)\{\gcd\alpha\} \qquad \text{(by the definition of } \mathbf{M}(\operatorname{red}\alpha, \gcd\alpha)) \\ &= \alpha \qquad \text{(by Remark 6.5.11(a))} \\ &= \operatorname{id}(\alpha).\end{aligned}$$

Now, let us forget that we fixed α. We thus have proven that $(\mathbf{M} \circ \mathbf{R})(\alpha) = \operatorname{id}(\alpha)$ for every $\alpha \in \mathfrak{L}$. Thus, $\mathbf{M} \circ \mathbf{R} = \operatorname{id}$, qed.

[1159], this rewrites as follows: The family $\left(M_w^{\langle s\rangle}\right)_{(w,s)\in\mathfrak{RL}\times\{1,2,3,\ldots\}}$ is a reindexing of the family $\left(M_{\operatorname{red}\alpha}^{\langle\gcd\alpha\rangle}\right)_{\alpha\in\mathfrak{L}}$. This proves Lemma 6.5.14. □

13.179. **Solution to Exercise 6.5.17.** *Solution to Exercise 6.5.17.* We shall give two proofs of Lemma 6.5.16.

First proof of Lemma 6.5.16. We first introduce some notation.

For every $m\in\mathbb{Z}$, let $\mathcal{F}_m$ denote the $\mathbf{k}$-submodule of QSym spanned by $(M_\beta)_{\beta\in\operatorname{Comp};\ \ell(\beta)\leq m}$. Then, $1\in\mathcal{F}_0$ [1160]. Furthermore,

$$\mathcal{F}_u\mathcal{F}_v\subset\mathcal{F}_{u+v}\qquad\text{for every } u\in\mathbb{Z}\text{ and } v\in\mathbb{Z}\tag{13.179.1}$$

[1161]. It is now easy to see that

$$(\mathcal{F}_m)^k\subset\mathcal{F}_{km}\qquad\text{for every } m\in\mathbb{Z}\text{ and } k\in\mathbb{N}\tag{13.179.2}$$

(where $(\mathcal{F}_m)^k$ means $\underbrace{\mathcal{F}_m\mathcal{F}_m\cdots\mathcal{F}_m}_{k\text{ times}}$) [1162].

Write the composition α in the form $\alpha=(\alpha_1,\alpha_2,\ldots,\alpha_\ell)$; then, $\ell=\ell(\alpha)$.

[1159] *Proof.* We have $\mathbf{R}\circ\mathbf{M}=\operatorname{id}$, thus $\underbrace{(\mathbf{R}\circ\mathbf{M})}_{=\operatorname{id}}(w,s)=\operatorname{id}(w,s)=(w,s)$ and therefore

$$(w,s)=(\mathbf{R}\circ\mathbf{M})(w,s)=\mathbf{R}(\mathbf{M}(w,s))=(\operatorname{red}(\mathbf{M}(w,s)),\gcd(\mathbf{M}(w,s)))\qquad(\text{by the definition of }\mathbf{R}(\mathbf{M}(w,s))).$$

Hence, $(\operatorname{red}(\mathbf{M}(w,s)),\gcd(\mathbf{M}(w,s)))=(w,s)$. In other words, $\operatorname{red}(\mathbf{M}(w,s))=w$ and $\gcd(\mathbf{M}(w,s))=s$, qed.

[1160] *Proof.* We know that $\mathcal{F}_0$ is the $\mathbf{k}$-submodule of QSym spanned by $(M_\beta)_{\beta\in\operatorname{Comp};\ \ell(\beta)\leq 0}$ (by the definition of $\mathcal{F}_0$). Hence, in particular, $M_\beta\in\mathcal{F}_0$ for every $\beta\in\operatorname{Comp}$ satisfying $\ell(\beta)\leq 0$. Applying this to $\beta=\varnothing$, we obtain $M_\varnothing\in\mathcal{F}_0$ (since $\ell(\varnothing)=0$). Since $M_\varnothing=1$, this rewrites as $1\in\mathcal{F}_0$, qed.

[1161] *Proof of (13.179.1):* Let $u\in\mathbb{Z}$ and $v\in\mathbb{Z}$. Let $p\in\mathcal{F}_u$ and $q\in\mathcal{F}_v$. We are going to prove that $pq\in\mathcal{F}_{u+v}$.

Notice that $\mathcal{F}_{u+v}$ is a $\mathbf{k}$-submodule of QSym. Hence, the claim that $pq\in\mathcal{F}_{u+v}$ is $\mathbf{k}$-linear in p.

We know that p belongs to $\mathcal{F}_u$. In other words, p is a $\mathbf{k}$-linear combination of the elements $(M_\beta)_{\beta\in\operatorname{Comp};\ \ell(\beta)\leq u}$ (since $\mathcal{F}_u$ is the $\mathbf{k}$-submodule of QSym spanned by $(M_\beta)_{\beta\in\operatorname{Comp};\ \ell(\beta)\leq u}$). Hence, we can WLOG assume that p is one of the elements $(M_\beta)_{\beta\in\operatorname{Comp};\ \ell(\beta)\leq u}$ (because the claim that we are proving – namely, the claim that $pq\in\mathcal{F}_{u+v}$ – is $\mathbf{k}$-linear in p). Assume this. Similarly, assume that q is one of the elements $(M_\beta)_{\beta\in\operatorname{Comp};\ \ell(\beta)\leq v}$.

There exists a $\varphi\in\operatorname{Comp}$ satisfying $\ell(\varphi)\leq u$ and $p=M_\varphi$ (since p is one of the elements $(M_\beta)_{\beta\in\operatorname{Comp};\ \ell(\beta)\leq u}$). Similarly, there exists a $\psi\in\operatorname{Comp}$ satisfying $\ell(\psi)\leq v$ and $q=M_\psi$. Consider these φ and ψ. Corollary 6.4.7 (applied to φ and ψ instead of α and β) shows that $M_\varphi M_\psi$ is a sum of terms of the form M_δ with $\delta\in\mathfrak{A}^*$ satisfying $\ell(\delta)\leq\ell(\varphi)+\ell(\psi)$. Since every $\delta\in\mathfrak{A}^*$ satisfying $\ell(\delta)\leq\ell(\varphi)+\ell(\psi)$ also satisfies $\ell(\delta)\leq u+v$ (because $\underbrace{\ell(\varphi)}_{\leq u}+\underbrace{\ell(\psi)}_{\leq v}\leq u+v$), this yields that $M_\varphi M_\psi$ is a sum of terms of the form M_δ with $\delta\in\mathfrak{A}^*$ satisfying $\ell(\delta)\leq u+v$. In particular, $M_\varphi M_\psi$ is a $\mathbf{k}$-linear combination of $(M_\delta)_{\delta\in\mathfrak{A}^*;\ \ell(\delta)\leq u+v}$. In other words, $M_\varphi M_\psi$ is a $\mathbf{k}$-linear combination of $(M_\delta)_{\delta\in\operatorname{Comp};\ \ell(\delta)\leq u+v}$ (since $\mathfrak{A}^*=\operatorname{Comp}$). In other words, $M_\varphi M_\psi$ is a $\mathbf{k}$-linear combination of $(M_\beta)_{\beta\in\operatorname{Comp};\ \ell(\beta)\leq u+v}$ (here, we renamed the index δ as β). In other words, $M_\varphi M_\psi$ belongs to the $\mathbf{k}$-submodule of QSym spanned by $(M_\beta)_{\beta\in\operatorname{Comp};\ \ell(\beta)\leq u+v}$. In other words, $M_\varphi M_\psi$ belongs to $\mathcal{F}_{u+v}$ (since $\mathcal{F}_{u+v}$ was defined as the $\mathbf{k}$-submodule of QSym spanned by $(M_\beta)_{\beta\in\operatorname{Comp};\ \ell(\beta)\leq u+v}$). Hence, $M_\varphi M_\psi\in\mathcal{F}_{u+v}$, so that $\underbrace{p}_{=M_\varphi}\underbrace{q}_{=M_\psi}=M_\varphi M_\psi\in\mathcal{F}_{u+v}$.

Now, let us forget that we fixed p and q. We thus have proven that $pq\in\mathcal{F}_{u+v}$ for any $p\in\mathcal{F}_u$ and $q\in\mathcal{F}_v$. Since $\mathcal{F}_{u+v}$ is a $\mathbf{k}$-submodule of QSym, this yields that $\mathcal{F}_u\mathcal{F}_v\subset\mathcal{F}_{u+v}$.

[1162] *Proof of (13.179.2):* Let $m\in\mathbb{Z}$. We shall prove that (13.179.2) holds for every $k\in\mathbb{N}$. Indeed, we shall prove this by induction over k:

Induction base: We have

$$\begin{aligned}(\mathcal{F}_m)^0&=\mathbf{k}\cdot\underbrace{1}_{\in\mathcal{F}_0}\subset\mathbf{k}\cdot\mathcal{F}_0\subset\mathcal{F}_0\qquad(\text{since }\mathcal{F}_0\text{ is a }\mathbf{k}\text{-module})\\&=\mathcal{F}_{0m}\qquad(\text{since }0=0m).\end{aligned}$$

In other words, (13.179.2) holds for $k=0$. This completes the induction base.

Induction step: Let $K\in\mathbb{N}$. Assume that (13.179.2) holds for $k=K$. We must then show that (13.179.2) holds for $k=K+1$.

Define $A_s^{\langle\alpha\rangle}$ and $a_{i,j}^{\langle\alpha\rangle}$ as in Proposition 6.5.6(a) (but with s instead of n). Then,

$$a_{i,j}^{\langle\alpha\rangle} = \begin{cases} M_{\alpha\{i-j+1\}}, & \text{if } i \geq j; \\ i, & \text{if } i = j-1; \\ 0, & \text{if } i < j-1 \end{cases} \qquad \text{for all } (i,j) \in \{1,2,\ldots,s\}^2 ,$$

and we have $A_s^{\langle\alpha\rangle} = \left(a_{i,j}^{\langle\alpha\rangle}\right)_{i,j=1,2,\ldots,s}$. Proposition 6.5.6(a) (applied to s instead of n) yields $\det\left(A_s^{\langle\alpha\rangle}\right) = s! M_\alpha^{\langle s\rangle}$. Since $A_s^{\langle\alpha\rangle} = \left(a_{i,j}^{\langle\alpha\rangle}\right)_{i,j=1,2,\ldots,s}$, this rewrites as

$$\det\left(\left(a_{i,j}^{\langle\alpha\rangle}\right)_{i,j=1,2,\ldots,s}\right) = s! M_\alpha^{\langle s\rangle}. \tag{13.179.3}$$

On the other hand, it is easy to see that

$$a_{i,j}^{\langle\alpha\rangle} \in \mathbf{k} \cdot 1 \qquad \text{for every } (i,j) \in \{1,2,\ldots,s\}^2 \text{ satisfying } i < j. \tag{13.179.4}$$

[1163] Furthermore,

$$a_{i,j}^{\langle\alpha\rangle} \in \mathcal{F}_\ell \qquad \text{for every } (i,j) \in \{1,2,\ldots,s\}^2 . \tag{13.179.5}$$

We have $(\mathcal{F}_m)^K \subset \mathcal{F}_{Km}$ (since (13.179.2) holds for $k = K$). Thus,

$$\begin{aligned} (\mathcal{F}_m)^{K+1} &= \underbrace{(\mathcal{F}_m)^K}_{\subset \mathcal{F}_{Km}} \cdot \mathcal{F}_m \subset \mathcal{F}_{Km} \cdot \mathcal{F}_m \subset \mathcal{F}_{Km+m} && \text{(by (13.179.1), applied to } u = Km \text{ and } v = m) \\ &= \mathcal{F}_{(K+1)m} && \text{(since } Km + m = (K+1)\,m) . \end{aligned}$$

In other words, (13.179.2) holds for $k = K+1$. This completes the induction step. The proof of (13.179.2) is thus complete.

[1163] *Proof of (13.179.4):* Let $(i,j) \in \{1,2,\ldots,s\}^2$ be such that $i < j$. We need to prove that $a_{i,j}^{\langle\alpha\rangle} \in \mathbf{k} \cdot 1$. This is clear in the case when $i = j-1$ (because in this case, we have

$$a_{i,j}^{\langle\alpha\rangle} = \begin{cases} M_{\alpha\{i-j+1\}}, & \text{if } i \geq j; \\ i, & \text{if } i = j-1; \\ 0, & \text{if } i < j-1 \end{cases} = i \qquad (\text{since } i = j-1)$$
$$\in \mathbf{k} \cdot 1$$

). Hence, for the rest of this proof, we can WLOG assume that $i = j-1$. Assume this. Thus, $i \neq j-1$.

We have $i < j$. Thus, $i \leq j-1$ (since i and j are integers), so that $i < j-1$ (since $i \neq j-1$). Now,

$$a_{i,j}^{\langle\alpha\rangle} = \begin{cases} M_{\alpha\{i-j+1\}}, & \text{if } i \geq j; \\ i, & \text{if } i = j-1; \\ 0, & \text{if } i < j-1 \end{cases} = 0 \qquad (\text{since } i < j-1)$$
$$\in \mathbf{k} \cdot 1,$$

and thus (13.179.4) is proven.

[1164] Finally,

$$a_{i,i}^{\langle\alpha\rangle} = M_\alpha \qquad \text{for every } i \in \{1, 2, \ldots, s\}. \tag{13.179.6}$$

[1165]

But recall that every commutative ring A, every $m \in \mathbb{N}$ and every matrix $(u_{i,j})_{i,j=1,2,\ldots,m} \in A^{m\times m}$ satisfy

$$\det\left((u_{i,j})_{i,j=1,2,\ldots,m}\right) = \sum_{\sigma\in\mathfrak{S}_m} (-1)^\sigma \prod_{i=1}^m u_{i,\sigma(i)}.$$

[1166] Applying this equality to $A = \operatorname{QSym}$, $m = s$ and $u_{i,j} = a_{i,j}^{\langle\alpha\rangle}$, we obtain

$$\begin{aligned}
\det\left(\left(a_{i,j}^{\langle\alpha\rangle}\right)_{i,j=1,2,\ldots,s}\right) &= \sum_{\sigma\in\mathfrak{S}_s} (-1)^\sigma \prod_{i=1}^s a_{i,\sigma(i)}^{\langle\alpha\rangle} \\
&= \underbrace{(-1)^{\operatorname{id}}}_{=1} \prod_{i=1}^s \underbrace{a_{i,\operatorname{id}(i)}^{\langle\alpha\rangle}}_{\substack{=a_{i,i}^{\langle\alpha\rangle}=M_\alpha \\ \text{(by (13.179.6))}}} + \sum_{\substack{\sigma\in\mathfrak{S}_s;\\ \sigma\neq\operatorname{id}}} (-1)^\sigma \prod_{i=1}^s a_{i,\sigma(i)}^{\langle\alpha\rangle} \\
&\qquad \left(\text{here, we have split off the addend for } \sigma = \operatorname{id} \text{ from the sum}\right) \\
&= \underbrace{\prod_{i=1}^s M_\alpha}_{=M_\alpha^s} + \sum_{\substack{\sigma\in\mathfrak{S}_s;\\ \sigma\neq\operatorname{id}}} (-1)^\sigma \prod_{i=1}^s a_{i,\sigma(i)}^{\langle\alpha\rangle} = M_\alpha^s + \sum_{\substack{\sigma\in\mathfrak{S}_s;\\ \sigma\neq\operatorname{id}}} (-1)^\sigma \prod_{i=1}^s a_{i,\sigma(i)}^{\langle\alpha\rangle}.
\end{aligned}$$

Compared with (13.179.3), this yields

$$s! M_\alpha^{\langle s\rangle} = M_\alpha^s + \sum_{\substack{\sigma\in\mathfrak{S}_s;\\ \sigma\neq\operatorname{id}}} (-1)^\sigma \prod_{i=1}^s a_{i,\sigma(i)}^{\langle\alpha\rangle}.$$

[1164] *Proof of (13.179.5):* Let $(i, j) \in \{1, 2, \ldots, s\}^2$. We need to show that $a_{i,j}^{\langle\alpha\rangle} \in \mathcal{F}_\ell$.

First, recall that $\mathcal{F}_\ell$ is the $\mathbf{k}$-submodule of QSym spanned by $(M_\beta)_{\beta\in\operatorname{Comp};\ \ell(\beta)\leq\ell}$ (by the definition of $\mathcal{F}_\ell$). In particular, $M_\beta \in \mathcal{F}_\ell$ for every $\beta \in \operatorname{Comp}$ satisfying $\ell(\beta) \leq \ell$. Applied to $\beta = \varnothing$, this yields that $M_\varnothing \in \mathcal{F}_\ell$ (since $\varnothing \in \operatorname{Comp}$ satisfies $\ell(\varnothing) = 0 \leq \ell(\alpha) = \ell$). Since $M_\varnothing = 1$, this rewrites as $1 \in \mathcal{F}_\ell$, whence $\mathbf{k} \cdot \underbrace{1}_{\in\mathcal{F}_\ell} \subset \mathbf{k} \cdot \mathcal{F}_\ell \subset \mathcal{F}_\ell$ (since $\mathcal{F}_\ell$ is a $\mathbf{k}$-module).

Now, if $i < j$, then (13.179.4) yields $a_{i,j}^{\langle\alpha\rangle} \in \mathbf{k} \cdot 1 \subset \mathcal{F}_\ell$. Hence, (13.179.5) is proven in the case when $i < j$. For the rest of our proof of (13.179.5), we can thus WLOG assume that we don't have $i < j$. Assume this.

We have $i \geq j$ (since we don't have $i < j$) and $\ell(\alpha\{i - j + 1\}) = \ell(\alpha)$ (since $\ell(\alpha\{k\}) = \ell(\alpha)$ for every positive integer k). Now, recall that $M_\beta \in \mathcal{F}_\ell$ for every $\beta \in \operatorname{Comp}$ satisfying $\ell(\beta) \leq \ell$. Applied to $\beta = \alpha\{i - j + 1\}$, this yields that $M_{\alpha\{i-j+1\}} \in \mathcal{F}_\ell$ (since $\ell(\alpha\{i - j + 1\}) = \ell(\alpha) = \ell$). Now,

$$\begin{aligned}
a_{i,j}^{\langle\alpha\rangle} &= \begin{cases} M_{\alpha\{i-j+1\}}, & \text{if } i \geq j; \\ i, & \text{if } i = j - 1; \\ 0, & \text{if } i < j - 1 \end{cases} = M_{\alpha\{i-j+1\}} \qquad (\text{since } i \geq j) \\
&\in \mathcal{F}_\ell,
\end{aligned}$$

and this proves (13.179.5).

[1165] *Proof of (13.179.6):* Let $i \in \{1, 2, \ldots, s\}$. Then, the definition of $a_{i,i}^{\langle\alpha\rangle}$ yields

$$\begin{aligned}
a_{i,i}^{\langle\alpha\rangle} &= \begin{cases} M_{\alpha\{i-i+1\}}, & \text{if } i \geq i; \\ i, & \text{if } i = i - 1; \\ 0, & \text{if } i < i - 1 \end{cases} = M_{\alpha\{i-i+1\}} \qquad (\text{since } i \geq i) \\
&= M_\alpha \qquad \left(\text{since } \alpha\left\{\underbrace{i - i + 1}_{=1}\right\} = \alpha\{1\} = \alpha\right),
\end{aligned}$$

qed.

[1166] This is simply the explicit formula for the determinant of a matrix as a sum over permutations.

Subtracting M_α^s from both sides of this equality, we obtain

$$s!M_\alpha^{\langle s\rangle} - M_\alpha^s = \sum_{\substack{\sigma\in\mathfrak{S}_s;\\ \sigma\neq\mathrm{id}}} (-1)^\sigma \prod_{i=1}^s a_{i,\sigma(i)}^{\langle\alpha\rangle}. \tag{13.179.7}$$

But it is easy to see that

$$\prod_{i=1}^s a_{i,\sigma(i)}^{\langle\alpha\rangle} \in \mathcal{F}_{(s-1)\ell} \qquad \text{for every } \sigma\in\mathfrak{S}_s \text{ satisfying } \sigma\neq\mathrm{id} \tag{13.179.8}$$

[1167]. Hence, (13.179.7) becomes

$$s!M_\alpha^{\langle s\rangle} - M_\alpha^s = \sum_{\substack{\sigma\in\mathfrak{S}_s;\\ \sigma\neq\mathrm{id}}} (-1)^\sigma \underbrace{\prod_{i=1}^s a_{i,\sigma(i)}^{\langle\alpha\rangle}}_{\substack{\in\mathcal{F}_{(s-1)\ell}\\ \text{(by (13.179.8))}}} \in \sum_{\substack{\sigma\in\mathfrak{S}_s;\\ \sigma\neq\mathrm{id}}} (-1)^\sigma \mathcal{F}_{(s-1)\ell} \subset \mathcal{F}_{(s-1)\ell} \tag{13.179.9}$$

(since $\mathcal{F}_{(s-1)\ell}$ is a $\mathbf{k}$-module).

But $\mathcal{F}_{(s-1)\ell}$ is the $\mathbf{k}$-submodule of QSym spanned by $(M_\beta)_{\beta\in\mathrm{Comp};\ \ell(\beta)\leq(s-1)\ell}$ (because this is how $\mathcal{F}_{(s-1)\ell}$ was defined). In other words,

$$\mathcal{F}_{(s-1)\ell} = \sum_{\substack{\beta\in\mathrm{Comp};\\ \ell(\beta)\leq(s-1)\ell}} \mathbf{k}M_\beta.$$

Hence, (13.179.9) becomes

$$s!M_\alpha^{\langle s\rangle} - M_\alpha^s \in \mathcal{F}_{(s-1)\ell} = \sum_{\substack{\beta\in\mathrm{Comp};\\ \ell(\beta)\leq(s-1)\ell}} \mathbf{k}M_\beta. \tag{13.179.10}$$

Also, $s!M_\alpha^{\langle s\rangle} - M_\alpha^s \in \mathcal{F}_{(s-1)\ell} \subset \mathrm{QSym}$, so that $s!M_\alpha^{\langle s\rangle} \in \underbrace{M_\alpha^s}_{\in\mathrm{QSym}} + \mathrm{QSym} \subset \mathrm{QSym}+\mathrm{QSym} \subset \mathrm{QSym}$.

Recall that $M_\alpha^{\langle s\rangle} = e_s\left((\mathbf{x}_\mathbf{i}^\alpha)_{\mathbf{i}\in\mathrm{SIS}(\ell)}\right)$. Thus, $M_\alpha^{\langle s\rangle}$ is a homogeneous power series of degree $s|\alpha|$ (since each $\mathbf{x}_\mathbf{i}^\alpha$ is a monomial of degree $|\alpha|$, and since e_s is a power series of degree s). Hence, $s!M_\alpha^{\langle s\rangle}$ is a homogeneous power series of degree $s|\alpha|$ as well. Thus, $s!M_\alpha^{\langle s\rangle} \in \mathrm{QSym}_{s|\alpha|}$ (since $s!M_\alpha^{\langle s\rangle} \in \mathrm{QSym}$). Also, $M_\alpha^s \in \mathrm{QSym}_{s|\alpha|}$ (since $M_\alpha \in \mathrm{QSym}_{|\alpha|}$). Thus, $\underbrace{s!M_\alpha^{\langle s\rangle}}_{\in\mathrm{QSym}_{s|\alpha|}} - \underbrace{M_\alpha^s}_{\in\mathrm{QSym}_{s|\alpha|}} \in \mathrm{QSym}_{s|\alpha|} - \mathrm{QSym}_{s|\alpha|} \subset \mathrm{QSym}_{s|\alpha|}$ (since $\mathrm{QSym}_{s|\alpha|}$ is a $\mathbf{k}$-module).

Now, let π denote the projection from the direct sum $\mathrm{QSym} = \bigoplus_{k\in\mathbb{N}} \mathrm{QSym}_k$ onto its $(s|\alpha|)$-th homogeneous component $\mathrm{QSym}_{s|\alpha|}$. Notice that $\pi\left(s!M_\alpha^{\langle s\rangle} - M_\alpha^s\right) = s!M_\alpha^{\langle s\rangle} - M_\alpha^s$ (since $s!M_\alpha^{\langle s\rangle} - M_\alpha^s \in \mathrm{QSym}_{s|\alpha|}$).

[1167] *Proof of (13.179.8):* Let $\sigma\in\mathfrak{S}_s$ be such that $\sigma\neq\mathrm{id}$. Then, there exists a $k\in\{1,2,\ldots,s\}$ such that $\sigma(k) > k$. Consider this k.

We have $k<\sigma(k)$ (since $\sigma(k)>k$) and thus $a_{k,\sigma(k)}^{\langle\alpha\rangle} \in \mathbf{k}\cdot 1$ (by (13.179.4), applied to $i=k$ and $j=\sigma(k)$). But

$$\underbrace{\prod_{i=1}^s}_{=\prod_{i\in\{1,2,\ldots,s\}}} a_{i,\sigma(i)}^{\langle\alpha\rangle} = \prod_{i\in\{1,2,\ldots,s\}} a_{i,\sigma(i)}^{\langle\alpha\rangle} = \underbrace{a_{k,\sigma(k)}^{\langle\alpha\rangle}}_{\in\mathbf{k}\cdot 1} \cdot \prod_{\substack{i\in\{1,2,\ldots,s\};\\ i\neq k}} \underbrace{a_{i,\sigma(i)}^{\langle\alpha\rangle}}_{\substack{\in\mathcal{F}_\ell\\ \text{(by (13.179.5), applied to } j=\sigma(i))}}$$

(here, we have split off the factor for $i=k$ from the product)

$$\in \mathbf{k}\cdot 1\cdot \underbrace{\prod_{\substack{i\in\{1,2,\ldots,s\};\\ i\neq k}} \mathcal{F}_\ell}_{\substack{=(\mathcal{F}_\ell)^{s-1}\subset\mathcal{F}_{(s-1)\ell}\\ \text{(by (13.179.2), applied to}\\ \ell \text{ and } s-1 \text{ instead of } m \text{ and } k)}} \subset \mathbf{k}\cdot \underbrace{1\cdot\mathcal{F}_{(s-1)\ell}}_{=\mathcal{F}_{(s-1)\ell}} = \mathbf{k}\cdot\mathcal{F}_{(s-1)\ell} \subset \mathcal{F}_{(s-1)\ell}$$

(since $\mathcal{F}_{(s-1)\ell}$ is a $\mathbf{k}$-module). This proves (13.179.8).

We have

$$\pi\left(M_{\beta}\right)=0 \qquad \text{for every } \beta\in\operatorname{Comp}\setminus\operatorname{Comp}_{s\left|\alpha\right|} \tag{13.179.11}$$

[1168].

Now, applying the map π to both sides of the relation (13.179.10), we obtain

$$\begin{aligned}
\pi\left(s!M_{\alpha}^{\langle s\rangle}-M_{\alpha}^{s}\right) &\in \pi\left(\sum_{\substack{\beta\in\operatorname{Comp};\\ \ell(\beta)\leq(s-1)\ell}}\mathbf{k}M_{\beta}\right)=\sum_{\substack{\beta\in\operatorname{Comp};\\ \ell(\beta)\leq(s-1)\ell}}\mathbf{k}\pi\left(M_{\beta}\right) \qquad \left(\text{since the map }\pi\text{ is }\mathbf{k}\text{-linear}\right)\\
&=\sum_{\substack{\beta\in\operatorname{Comp}_{s\left|\alpha\right|};\\ \ell(\beta)\leq(s-1)\ell}}\mathbf{k}\underbrace{\pi\left(M_{\beta}\right)}_{\substack{=M_{\beta}\\ \text{(since }M_{\beta}\in\operatorname{QSym}_{s\left|\alpha\right|}\\ \text{(because }\beta\in\operatorname{Comp}_{s\left|\alpha\right|}\text{),}\\ \text{whereas }\pi\text{ is a projection}\\ \text{onto }\operatorname{QSym}_{s\left|\alpha\right|}\text{)}}}+\sum_{\substack{\beta\in\operatorname{Comp}\setminus\operatorname{Comp}_{s\left|\alpha\right|};\\ \ell(\beta)\leq(s-1)\ell}}\mathbf{k}\underbrace{\pi\left(M_{\beta}\right)}_{\substack{=0\\ \text{(by (13.179.11))}}}\\
&\qquad\left(\begin{array}{c}\text{since the set }\operatorname{Comp}\text{ is the union of its two}\\ \text{disjoint subsets }\operatorname{Comp}_{s\left|\alpha\right|}\text{ and }\operatorname{Comp}\setminus\operatorname{Comp}_{s\left|\alpha\right|}\end{array}\right)\\
&=\sum_{\substack{\beta\in\operatorname{Comp}_{s\left|\alpha\right|};\\ \ell(\beta)\leq(s-1)\ell}}\mathbf{k}M_{\beta}+\underbrace{\sum_{\substack{\beta\in\operatorname{Comp}\setminus\operatorname{Comp}_{s\left|\alpha\right|};\\ \ell(\beta)\leq(s-1)\ell}}\mathbf{k}0}_{=0}=\sum_{\substack{\beta\in\operatorname{Comp}_{s\left|\alpha\right|};\\ \ell(\beta)\leq(s-1)\ell}}\mathbf{k}M_{\beta}=\sum_{\substack{\beta\in\operatorname{Comp}_{s\left|\alpha\right|};\\ \ell(\beta)\leq(s-1)\ell(\alpha)}}\mathbf{k}M_{\beta}
\end{aligned}$$

(since $\ell=\ell\left(\alpha\right)$). Since $\pi\left(s!M_{\alpha}^{\langle s\rangle}-M_{\alpha}^{s}\right)=s!M_{\alpha}^{\langle s\rangle}-M_{\alpha}^{s}$, this rewrites as $s!M_{\alpha}^{\langle s\rangle}-M_{\alpha}^{s}\in\sum_{\substack{\beta\in\operatorname{Comp}_{s\left|\alpha\right|};\\ \ell(\beta)\leq(s-1)\ell(\alpha)}}\mathbf{k}M_{\beta}$. This proves Lemma 6.5.16. □

Second proof of Lemma 6.5.16. Let us first notice that if γ and β are two compositions, then

$$\left(\text{the coefficient of the monomial }\mathbf{x}^{\gamma}\text{ in }M_{\beta}\right)=\delta_{\gamma,\beta}. \tag{13.179.12}$$

(This follows from the definition of M_{β}.)

Write the composition α in the form $\alpha=\left(\alpha_1,\alpha_2,\ldots,\alpha_\ell\right)$; then, $\ell=\ell\left(\alpha\right)$. Let us now fix a total order on the set $\operatorname{SIS}\left(\ell\right)$ (for example, the lexicographic order). Exercise 6.5.4(b) yields

$$M_{\alpha}^{\langle s\rangle}=\sum_{\substack{(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\in(\operatorname{SIS}(\ell))^s;\\ \mathbf{i}_1<\mathbf{i}_2<\cdots<\mathbf{i}_s}}\mathbf{x}_{\mathbf{i}_1}^{\alpha}\mathbf{x}_{\mathbf{i}_2}^{\alpha}\cdots\mathbf{x}_{\mathbf{i}_s}^{\alpha}. \tag{13.179.13}$$

Now, for every $\left(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s\right)\in\left(\operatorname{SIS}\left(\ell\right)\right)^s$ such that $\mathbf{i}_1$, $\mathbf{i}_2$, $\ldots$, $\mathbf{i}_s$ are distinct, there exists a **unique** $\sigma\in\mathfrak{S}_s$ satisfying $\mathbf{i}_{\sigma(1)}<\mathbf{i}_{\sigma(2)}<\cdots<\mathbf{i}_{\sigma(s)}$ (because there is exactly one way to sort the ℓ-tuple $\left(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s\right)$ into increasing order[1169]). Hence, we can split the sum $\sum_{\substack{(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\in(\operatorname{SIS}(\ell))^s;\\ \mathbf{i}_1,\ \mathbf{i}_2,\ \ldots,\ \mathbf{i}_s\text{ are distinct}}}\mathbf{x}_{\mathbf{i}_1}^{\alpha}\mathbf{x}_{\mathbf{i}_2}^{\alpha}\cdots\mathbf{x}_{\mathbf{i}_s}^{\alpha}$ into several subsums,

[1168] *Proof of (13.179.11):* Let $\beta\in\operatorname{Comp}\setminus\operatorname{Comp}_{s\left|\alpha\right|}$. Then, $\beta\in\operatorname{Comp}$ but $\beta\notin\operatorname{Comp}_{s\left|\alpha\right|}$. In other words, β is a composition with size $\left|\beta\right|\neq s\left|\alpha\right|$. As a consequence, M_{β} is a homogeneous element of QSym of degree $\left|\beta\right|\neq s\left|\alpha\right|$. Therefore, $\pi\left(M_{\beta}\right)=0$ (since π is the projection from the direct sum $\operatorname{QSym}=\bigoplus_{k\in\mathbb{N}}\operatorname{QSym}_k$ onto its $\left(s\left|\alpha\right|\right)$-th homogeneous component $\operatorname{QSym}_{s\left|\alpha\right|}$). This proves (13.179.11).

[1169] Here, we are using that the order on $\operatorname{SIS}\left(\ell\right)$ is total.

one for each $\sigma \in \mathfrak{S}_s$, as follows:

$$\begin{aligned}
&\sum_{\substack{(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\in(\operatorname{SIS}(\ell))^s;\\ \mathbf{i}_1,\ \mathbf{i}_2,\ \ldots,\ \mathbf{i}_s \text{ are distinct}}} \mathbf{x}_{\mathbf{i}_1}^{\alpha}\mathbf{x}_{\mathbf{i}_2}^{\alpha}\cdots\mathbf{x}_{\mathbf{i}_s}^{\alpha} \\
&= \sum_{\sigma\in\mathfrak{S}_s} \underbrace{\sum_{\substack{(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\in(\operatorname{SIS}(\ell))^s;\\ \mathbf{i}_1,\ \mathbf{i}_2,\ \ldots,\ \mathbf{i}_s \text{ are distinct;}\\ \mathbf{i}_{\sigma(1)}<\mathbf{i}_{\sigma(2)}<\cdots<\mathbf{i}_{\sigma(s)}}}}_{\substack{=\sum_{\substack{(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\in(\operatorname{SIS}(\ell))^s;\\ \mathbf{i}_{\sigma(1)}<\mathbf{i}_{\sigma(2)}<\cdots<\mathbf{i}_{\sigma(s)}}} \\ \text{(since the condition that } \mathbf{i}_1,\ \mathbf{i}_2,\ \ldots,\ \mathbf{i}_s \text{ are distinct} \\ \text{follows from the condition that } \mathbf{i}_{\sigma(1)}<\mathbf{i}_{\sigma(2)}<\cdots<\mathbf{i}_{\sigma(s)} \\ \text{(because if } \mathbf{i}_{\sigma(1)}<\mathbf{i}_{\sigma(2)}<\cdots<\mathbf{i}_{\sigma(s)}\text{, then } \mathbf{i}_{\sigma(1)},\ \mathbf{i}_{\sigma(2)},\ \ldots,\ \mathbf{i}_{\sigma(s)} \text{ are} \\ \text{distinct, and thus } \mathbf{i}_1,\ \mathbf{i}_2,\ \ldots,\ \mathbf{i}_s \text{ are distinct} \\ \text{(since } \sigma \text{ is a permutation of } \{1,2,\ldots,s\})))}} \mathbf{x}_{\mathbf{i}_1}^{\alpha}\mathbf{x}_{\mathbf{i}_2}^{\alpha}\cdots\mathbf{x}_{\mathbf{i}_s}^{\alpha} \\
&= \sum_{\sigma\in\mathfrak{S}_s} \sum_{\substack{(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\in(\operatorname{SIS}(\ell))^s;\\ \mathbf{i}_{\sigma(1)}<\mathbf{i}_{\sigma(2)}<\cdots<\mathbf{i}_{\sigma(s)}}} \mathbf{x}_{\mathbf{i}_1}^{\alpha}\mathbf{x}_{\mathbf{i}_2}^{\alpha}\cdots\mathbf{x}_{\mathbf{i}_s}^{\alpha}.
\end{aligned} \tag{13.179.14}$$

But every $\sigma \in \mathfrak{S}_s$ and every $(\mathbf{i}_1, \mathbf{i}_2, \ldots, \mathbf{i}_s) \in (\operatorname{SIS}(\ell))^s$ satisfy

$$\mathbf{x}_{\mathbf{i}_1}^{\alpha}\mathbf{x}_{\mathbf{i}_2}^{\alpha}\cdots\mathbf{x}_{\mathbf{i}_s}^{\alpha} = \mathbf{x}_{\mathbf{i}_{\sigma(1)}}^{\alpha}\mathbf{x}_{\mathbf{i}_{\sigma(2)}}^{\alpha}\cdots\mathbf{x}_{\mathbf{i}_{\sigma(s)}}^{\alpha} \tag{13.179.15}$$

[1170]. Now, (13.179.14) becomes

$$\begin{aligned}
&\sum_{\substack{(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\in(\operatorname{SIS}(\ell))^s;\\ \mathbf{i}_1,\ \mathbf{i}_2,\ \ldots,\ \mathbf{i}_s \text{ are distinct}}} \mathbf{x}_{\mathbf{i}_1}^{\alpha}\mathbf{x}_{\mathbf{i}_2}^{\alpha}\cdots\mathbf{x}_{\mathbf{i}_s}^{\alpha} \\
&= \sum_{\sigma\in\mathfrak{S}_s} \sum_{\substack{(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\in(\operatorname{SIS}(\ell))^s;\\ \mathbf{i}_{\sigma(1)}<\mathbf{i}_{\sigma(2)}<\cdots<\mathbf{i}_{\sigma(s)}}} \underbrace{\mathbf{x}_{\mathbf{i}_1}^{\alpha}\mathbf{x}_{\mathbf{i}_2}^{\alpha}\cdots\mathbf{x}_{\mathbf{i}_s}^{\alpha}}_{\substack{=\mathbf{x}_{\mathbf{i}_{\sigma(1)}}^{\alpha}\mathbf{x}_{\mathbf{i}_{\sigma(2)}}^{\alpha}\cdots\mathbf{x}_{\mathbf{i}_{\sigma(s)}}^{\alpha} \\ \text{(by (13.179.15))}}} \\
&= \sum_{\sigma\in\mathfrak{S}_s} \underbrace{\sum_{\substack{(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\in(\operatorname{SIS}(\ell))^s;\\ \mathbf{i}_{\sigma(1)}<\mathbf{i}_{\sigma(2)}<\cdots<\mathbf{i}_{\sigma(s)}}} \mathbf{x}_{\mathbf{i}_{\sigma(1)}}^{\alpha}\mathbf{x}_{\mathbf{i}_{\sigma(2)}}^{\alpha}\cdots\mathbf{x}_{\mathbf{i}_{\sigma(s)}}^{\alpha}}_{\substack{=\sum_{\substack{(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\in(\operatorname{SIS}(\ell))^s;\\ \mathbf{i}_1<\mathbf{i}_2<\cdots<\mathbf{i}_s}} \mathbf{x}_{\mathbf{i}_1}^{\alpha}\mathbf{x}_{\mathbf{i}_2}^{\alpha}\cdots\mathbf{x}_{\mathbf{i}_s}^{\alpha} \\ \text{(here, we have substituted } (\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s) \\ \text{for } \left(\mathbf{i}_{\sigma(1)},\mathbf{i}_{\sigma(2)},\ldots,\mathbf{i}_{\sigma(s)}\right) \text{ in the sum} \\ \text{(since } \sigma \text{ is a permutation of } \{1,2,\ldots,s\}))}} \\
&= \sum_{\sigma\in\mathfrak{S}_s} \underbrace{\sum_{\substack{(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\in(\operatorname{SIS}(\ell))^s;\\ \mathbf{i}_1<\mathbf{i}_2<\cdots<\mathbf{i}_s}} \mathbf{x}_{\mathbf{i}_1}^{\alpha}\mathbf{x}_{\mathbf{i}_2}^{\alpha}\cdots\mathbf{x}_{\mathbf{i}_s}^{\alpha}}_{\substack{=M_{\alpha}^{\langle s\rangle} \\ \text{(by (13.179.13))}}} = \sum_{\sigma\in\mathfrak{S}_s} M_{\alpha}^{\langle s\rangle} = \underbrace{\left|\mathfrak{S}_s\right|}_{=s!} M_{\alpha}^{\langle s\rangle} = s! M_{\alpha}^{\langle s\rangle}.
\end{aligned} \tag{13.179.16}$$

[1170] *Proof of (13.179.15):* Let $\sigma \in \mathfrak{S}_s$ and $(\mathbf{i}_1, \mathbf{i}_2, \ldots, \mathbf{i}_s) \in (\operatorname{SIS}(\ell))^s$. Then, the product $\mathbf{x}_{\mathbf{i}_{\sigma(1)}}^{\alpha}\mathbf{x}_{\mathbf{i}_{\sigma(2)}}^{\alpha}\cdots\mathbf{x}_{\mathbf{i}_{\sigma(s)}}^{\alpha}$ is obtained from the product $\mathbf{x}_{\mathbf{i}_1}^{\alpha}\mathbf{x}_{\mathbf{i}_2}^{\alpha}\cdots\mathbf{x}_{\mathbf{i}_s}^{\alpha}$ by rearranging the factors according to the permutation σ. Since rearranging the factors of a product in QSym does not change the value of the product (because the algebra QSym is commutative), this yields that $\mathbf{x}_{\mathbf{i}_{\sigma(1)}}^{\alpha}\mathbf{x}_{\mathbf{i}_{\sigma(2)}}^{\alpha}\cdots\mathbf{x}_{\mathbf{i}_{\sigma(s)}}^{\alpha} = \mathbf{x}_{\mathbf{i}_1}^{\alpha}\mathbf{x}_{\mathbf{i}_2}^{\alpha}\cdots\mathbf{x}_{\mathbf{i}_s}^{\alpha}$. This proves (13.179.15).

On the other hand, taking both sides of the identity (6.5.1) to the s-th power, we obtain

$$\begin{aligned} M_\alpha^s &= \left(\sum_{\mathbf{i} \in \operatorname{SIS}(\ell)} \mathbf{x}_{\mathbf{i}}^\alpha \right)^s = \sum_{(\mathbf{i}_1, \mathbf{i}_2, \ldots, \mathbf{i}_s) \in (\operatorname{SIS}(\ell))^s} \mathbf{x}_{\mathbf{i}_1}^\alpha \mathbf{x}_{\mathbf{i}_2}^\alpha \cdots \mathbf{x}_{\mathbf{i}_s}^\alpha \qquad \text{(by the product rule)} \\ &= \underbrace{\sum_{\substack{(\mathbf{i}_1, \mathbf{i}_2, \ldots, \mathbf{i}_s) \in (\operatorname{SIS}(\ell))^s; \\ \mathbf{i}_1,\ \mathbf{i}_2,\ \ldots,\ \mathbf{i}_s \text{ are distinct}}} \mathbf{x}_{\mathbf{i}_1}^\alpha \mathbf{x}_{\mathbf{i}_2}^\alpha \cdots \mathbf{x}_{\mathbf{i}_s}^\alpha}_{\substack{= s! M_\alpha^{\langle s \rangle} \\ \text{(by (13.179.16))}}} + \sum_{\substack{(\mathbf{i}_1, \mathbf{i}_2, \ldots, \mathbf{i}_s) \in (\operatorname{SIS}(\ell))^s; \\ \mathbf{i}_1,\ \mathbf{i}_2,\ \ldots,\ \mathbf{i}_s \text{ are not distinct}}} \mathbf{x}_{\mathbf{i}_1}^\alpha \mathbf{x}_{\mathbf{i}_2}^\alpha \cdots \mathbf{x}_{\mathbf{i}_s}^\alpha \\ &= s! M_\alpha^{\langle s \rangle} + \sum_{\substack{(\mathbf{i}_1, \mathbf{i}_2, \ldots, \mathbf{i}_s) \in (\operatorname{SIS}(\ell))^s; \\ \mathbf{i}_1,\ \mathbf{i}_2,\ \ldots,\ \mathbf{i}_s \text{ are not distinct}}} \mathbf{x}_{\mathbf{i}_1}^\alpha \mathbf{x}_{\mathbf{i}_2}^\alpha \cdots \mathbf{x}_{\mathbf{i}_s}^\alpha . \end{aligned}$$

Hence,

$$M_\alpha^s - s! M_\alpha^{\langle s \rangle} = \sum_{\substack{(\mathbf{i}_1, \mathbf{i}_2, \ldots, \mathbf{i}_s) \in (\operatorname{SIS}(\ell))^s; \\ \mathbf{i}_1,\ \mathbf{i}_2,\ \ldots,\ \mathbf{i}_s \text{ are not distinct}}} \mathbf{x}_{\mathbf{i}_1}^\alpha \mathbf{x}_{\mathbf{i}_2}^\alpha \cdots \mathbf{x}_{\mathbf{i}_s}^\alpha . \tag{13.179.17}$$

But $M_\alpha^{\langle s \rangle} \in \operatorname{QSym}$ (by Corollary 6.5.8(a)), so that $\underbrace{M_\alpha^s}_{\in \operatorname{QSym}} - s! \underbrace{M_\alpha^{\langle s \rangle}}_{\in \operatorname{QSym}} \in \operatorname{QSym} - s! \operatorname{QSym} \subset \operatorname{QSym}$. Hence, $M_\alpha^s - s! M_\alpha^{\langle s \rangle}$ is a $\mathbf{k}$-linear combination of the family $(M_\beta)_{\beta \in \operatorname{Comp}}$ (since this family $(M_\beta)_{\beta \in \operatorname{Comp}}$ is a basis of the $\mathbf{k}$-module QSym). In other words, there exists a family $(c_\beta)_{\beta \in \operatorname{Comp}} \in \mathbf{k}^{\operatorname{Comp}}$ of elements of $\mathbf{k}$ such that (all but finitely many $\beta \in \operatorname{Comp}$ satisfy $c_\beta = 0$) and

$$s! M_\alpha^{\langle s \rangle} - M_\alpha^s = \sum_{\beta \in \operatorname{Comp}} c_\beta M_\beta . \tag{13.179.18}$$

Consider this family $(c_\beta)_{\beta \in \operatorname{Comp}} \in \mathbf{k}^{\operatorname{Comp}}$. Every composition γ satisfies

$$\begin{aligned} &\left(\text{the coefficient of the monomial } \mathbf{x}^\gamma \text{ in } \underbrace{s! M_\alpha^{\langle s \rangle} - M_\alpha^s}_{\substack{= \sum_{\beta \in \operatorname{Comp}} c_\beta M_\beta \\ \text{(by (13.179.18))}}} \right) \\ &= \left(\text{the coefficient of the monomial } \mathbf{x}^\gamma \text{ in } \sum_{\beta \in \operatorname{Comp}} c_\beta M_\beta \right) \\ &= \sum_{\beta \in \operatorname{Comp}} c_\beta \underbrace{(\text{the coefficient of the monomial } \mathbf{x}^\gamma \text{ in } M_\beta)}_{\substack{= \delta_{\gamma, \beta} \\ \text{(by (13.179.12))}}} \\ &= \sum_{\beta \in \operatorname{Comp}} c_\beta \delta_{\gamma, \beta} = c_\gamma . \end{aligned}$$

Hence, every composition γ satisfies

$$c_\gamma = \left(\text{the coefficient of the monomial } \mathbf{x}^\gamma \text{ in } s! M_\alpha^{\langle s \rangle} - M_\alpha^s \right) .$$

Thus, every composition γ satisfies

$$\begin{aligned}
-c_\gamma &= -\left(\text{the coefficient of the monomial } \mathbf{x}^\gamma \text{ in } s!M_\alpha^{\langle s\rangle} - M_\alpha^s\right) \\
&= \left(\text{the coefficient of the monomial } \mathbf{x}^\gamma \text{ in } \underbrace{-\left(s!M_\alpha^{\langle s\rangle} - M_\alpha^s\right)}_{\substack{=M_\alpha^s - s!M_\alpha^{\langle s\rangle} \\ = \sum_{\substack{(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\in(\operatorname{SIS}(\ell))^s; \\ \mathbf{i}_1,\ \mathbf{i}_2,\ \ldots,\ \mathbf{i}_s \text{ are not distinct}}} \mathbf{x}_{\mathbf{i}_1}^\alpha \mathbf{x}_{\mathbf{i}_2}^\alpha \cdots \mathbf{x}_{\mathbf{i}_s}^\alpha \\ \text{(by (13.179.17))}}}\right) \\
&= \left(\text{the coefficient of the monomial } \mathbf{x}^\gamma \text{ in } \sum_{\substack{(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\in(\operatorname{SIS}(\ell))^s; \\ \mathbf{i}_1,\ \mathbf{i}_2,\ \ldots,\ \mathbf{i}_s \text{ are not distinct}}} \mathbf{x}_{\mathbf{i}_1}^\alpha \mathbf{x}_{\mathbf{i}_2}^\alpha \cdots \mathbf{x}_{\mathbf{i}_s}^\alpha\right) \\
&= \sum_{\substack{(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\in(\operatorname{SIS}(\ell))^s; \\ \mathbf{i}_1,\ \mathbf{i}_2,\ \ldots,\ \mathbf{i}_s \text{ are not distinct}}} \left(\text{the coefficient of the monomial } \mathbf{x}^\gamma \text{ in } \mathbf{x}_{\mathbf{i}_1}^\alpha \mathbf{x}_{\mathbf{i}_2}^\alpha \cdots \mathbf{x}_{\mathbf{i}_s}^\alpha\right). \qquad (13.179.19)
\end{aligned}$$

We now notice that if γ is a composition satisfying $|\gamma| \neq s\,|\alpha|$, then

$$\left(\text{the coefficient of the monomial } \mathbf{x}^\gamma \text{ in } \mathbf{x}_{\mathbf{i}_1}^\alpha \mathbf{x}_{\mathbf{i}_2}^\alpha \cdots \mathbf{x}_{\mathbf{i}_s}^\alpha\right) = 0 \qquad (13.179.20)$$

for every $(\mathbf{i}_1, \mathbf{i}_2, \ldots, \mathbf{i}_s) \in (\operatorname{SIS}(\ell))^s$ [1171]. Also, if γ is a composition satisfying $\ell(\gamma) > (s-1)\,\ell(\alpha)$, then

$$\left(\text{the coefficient of the monomial } \mathbf{x}^\gamma \text{ in } \mathbf{x}_{\mathbf{i}_1}^\alpha \mathbf{x}_{\mathbf{i}_2}^\alpha \cdots \mathbf{x}_{\mathbf{i}_s}^\alpha\right) = 0 \qquad (13.179.22)$$

[1171] *Proof of (13.179.20):* Let γ be a composition satisfying $|\gamma| \neq s\,|\alpha|$. Let $(\mathbf{i}_1, \mathbf{i}_2, \ldots, \mathbf{i}_s) \in (\operatorname{SIS}(\ell))^s$. Then, the monomial $\mathbf{x}_{\mathbf{i}_1}^\alpha \mathbf{x}_{\mathbf{i}_2}^\alpha \cdots \mathbf{x}_{\mathbf{i}_s}^\alpha$ has degree

$$\deg\left(\mathbf{x}_{\mathbf{i}_1}^\alpha \mathbf{x}_{\mathbf{i}_2}^\alpha \cdots \mathbf{x}_{\mathbf{i}_s}^\alpha\right) = \deg\left(\mathbf{x}_{\mathbf{i}_1}^\alpha\right) + \deg\left(\mathbf{x}_{\mathbf{i}_2}^\alpha\right) + \cdots + \deg\left(\mathbf{x}_{\mathbf{i}_s}^\alpha\right).$$

However, for every $\mathbf{i} \in \operatorname{SIS}(\ell)$, the monomial $\mathbf{x}_\mathbf{i}^\alpha$ is a monomial of degree $|\alpha|$. Thus, for every $\mathbf{i} \in \operatorname{SIS}(\ell)$, we have

$$\deg\left(\mathbf{x}_\mathbf{i}^\alpha\right) = |\alpha|. \qquad (13.179.21)$$

Hence, for every $k \in \{1, 2, \ldots, s\}$, we have $\deg\left(\mathbf{x}_{\mathbf{i}_k}^\alpha\right) = |\alpha|$ (by (13.179.21), applied to $\mathbf{i} = \mathbf{i}_k$). Adding up these equalities over all $k \in \{1, 2, \ldots, s\}$, we obtain $\deg\left(\mathbf{x}_{\mathbf{i}_1}^\alpha\right) + \deg\left(\mathbf{x}_{\mathbf{i}_2}^\alpha\right) + \cdots + \deg\left(\mathbf{x}_{\mathbf{i}_s}^\alpha\right) = \underbrace{|\alpha| + |\alpha| + \cdots + |\alpha|}_{s \text{ times}} = s\,|\alpha|$. Hence,

$$\deg\left(\mathbf{x}_{\mathbf{i}_1}^\alpha \mathbf{x}_{\mathbf{i}_2}^\alpha \cdots \mathbf{x}_{\mathbf{i}_s}^\alpha\right) = \deg\left(\mathbf{x}_{\mathbf{i}_1}^\alpha\right) + \deg\left(\mathbf{x}_{\mathbf{i}_2}^\alpha\right) + \cdots + \deg\left(\mathbf{x}_{\mathbf{i}_s}^\alpha\right) = s\,|\alpha|,$$

so that $s\,|\alpha| = \deg\left(\mathbf{x}_{\mathbf{i}_1}^\alpha \mathbf{x}_{\mathbf{i}_2}^\alpha \cdots \mathbf{x}_{\mathbf{i}_s}^\alpha\right)$. But $\deg\left(\mathbf{x}^\gamma\right) = |\gamma| \neq s\,|\alpha| = \deg\left(\mathbf{x}_{\mathbf{i}_1}^\alpha \mathbf{x}_{\mathbf{i}_2}^\alpha \cdots \mathbf{x}_{\mathbf{i}_s}^\alpha\right)$. In other words, the monomials $\mathbf{x}^\gamma$ and $\mathbf{x}_{\mathbf{i}_1}^\alpha \mathbf{x}_{\mathbf{i}_2}^\alpha \cdots \mathbf{x}_{\mathbf{i}_s}^\alpha$ have different degrees; thus, these monomials are distinct. Therefore, $\left(\text{the coefficient of the monomial } \mathbf{x}^\gamma \text{ in } \mathbf{x}_{\mathbf{i}_1}^\alpha \mathbf{x}_{\mathbf{i}_2}^\alpha \cdots \mathbf{x}_{\mathbf{i}_s}^\alpha\right) = 0$. This proves (13.179.20).

for every $(\mathbf{i}_1, \mathbf{i}_2, \ldots, \mathbf{i}_s) \in (\operatorname{SIS}(\ell))^s$ satisfying ($\mathbf{i}_1$, $\mathbf{i}_2$, $\ldots$, $\mathbf{i}_s$ are not distinct) [1172]. Now, if γ is a composition satisfying $|\gamma| \neq s|\alpha|$, then

$$-c_\gamma = \sum_{\substack{(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\in(\operatorname{SIS}(\ell))^s;\\ \mathbf{i}_1,\ \mathbf{i}_2,\ \ldots,\ \mathbf{i}_s \text{ are not distinct}}} \underbrace{\left(\text{the coefficient of the monomial } \mathbf{x}^\gamma \text{ in } \mathbf{x}_{\mathbf{i}_1}^\alpha \mathbf{x}_{\mathbf{i}_2}^\alpha \cdots \mathbf{x}_{\mathbf{i}_s}^\alpha\right)}_{\substack{=0\\ (\text{by } (13.179.20))}} \qquad (\text{by } (13.179.19))$$
$$= \sum_{\substack{(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\in(\operatorname{SIS}(\ell))^s;\\ \mathbf{i}_1,\ \mathbf{i}_2,\ \ldots,\ \mathbf{i}_s \text{ are not distinct}}} 0 = 0.$$

[1172] *Proof of (13.179.22):* Let γ be a composition satisfying $\ell(\gamma) > (s-1)\ell(\alpha)$. Let $(\mathbf{i}_1, \mathbf{i}_2, \ldots, \mathbf{i}_s) \in (\operatorname{SIS}(\ell))^s$ be such that ($\mathbf{i}_1$, $\mathbf{i}_2$, $\ldots$, $\mathbf{i}_s$ are not distinct).

For every monomial $\mathbf{m}$ in the variables $x_1, x_2, x_3, \ldots$, we denote by $\operatorname{Supp}\mathbf{m}$ the set of all variables which occur in the monomial $\mathbf{m}$ (where we say that a variable *occurs* in $\mathbf{m}$ if and only if its exponent in $\mathbf{m}$ is positive). For instance, $\operatorname{Supp} 1 = \varnothing$ and $\operatorname{Supp}\left(x_2^3 x_3 x_5^4\right) = \{x_2, x_3, x_5\}$ and $\operatorname{Supp}\left(\underbrace{x_3 x_4^0}_{=x_3}\right) = \operatorname{Supp}(x_3) = \{x_3\}$. It is very easy to see that $\operatorname{Supp}(\mathbf{mn}) = (\operatorname{Supp}\mathbf{m}) \cup (\operatorname{Supp}\mathbf{n})$ for any two monomials $\mathbf{m}$ and $\mathbf{n}$. More generally, if $k \in \mathbb{N}$, and if $\mathbf{m}_1$, $\mathbf{m}_2$, $\ldots$, $\mathbf{m}_k$ are k monomials, then

$$(13.179.23) \qquad \operatorname{Supp}(\mathbf{m}_1\mathbf{m}_2\cdots\mathbf{m}_k) = (\operatorname{Supp}(\mathbf{m}_1)) \cup (\operatorname{Supp}(\mathbf{m}_2)) \cup \cdots \cup (\operatorname{Supp}(\mathbf{m}_k)).$$

On the other hand,

$$(13.179.24) \qquad \left|\operatorname{Supp}\left(\mathbf{x}^\beta\right)\right| = \ell(\beta) \qquad \text{for every composition } \beta.$$

[*Proof of (13.179.24):* Let β be a composition. Write β in the form $\beta = \left(\beta_1, \beta_2, \ldots, \beta_{\ell(\beta)}\right)$. Then, $\mathbf{x}^\beta = x_1^{\beta_1} x_2^{\beta_2} \cdots x_{\ell(\beta)}^{\beta_{\ell(\beta)}}$. Hence, the variables x_1, x_2, $\ldots$, $x_{\ell(\beta)}$ all occur in the monomial $\mathbf{x}^\beta$ (since their exponents β_1, β_2, $\ldots$, $\beta_{\ell(\beta)}$ are positive), and no other variables do. In other words, the set of all variables which occur in the monomial $\mathbf{x}^\beta$ is $\left\{x_1, x_2, \ldots, x_{\ell(\beta)}\right\}$. In other words, $\operatorname{Supp}\left(\mathbf{x}^\beta\right)$ is $\left\{x_1, x_2, \ldots, x_{\ell(\beta)}\right\}$ (since $\operatorname{Supp}\left(\mathbf{x}^\beta\right)$ is the set of all variables which occur in the monomial $\mathbf{x}^\beta$ (by the definition of $\operatorname{Supp}\left(\mathbf{x}^\beta\right)$)). In other words, $\operatorname{Supp}\left(\mathbf{x}^\beta\right) = \left\{x_1, x_2, \ldots, x_{\ell(\beta)}\right\}$, so that $\left|\operatorname{Supp}\left(\mathbf{x}^\beta\right)\right| = \left|\left\{x_1, x_2, \ldots, x_{\ell(\beta)}\right\}\right| = \ell(\beta)$. This proves (13.179.24).]

Also,

$$(13.179.25) \qquad \left|\operatorname{Supp}\left(\mathbf{x}_\mathbf{i}^\alpha\right)\right| = \ell \qquad \text{for every } \mathbf{i} \in \operatorname{SIS}(\ell).$$

[*Proof of (13.179.25):* Let $\mathbf{i} \in \operatorname{SIS}(\ell)$. Then, $\mathbf{i}$ is a strictly increasing ℓ-tuple of positive integers. In other words, we can write $\mathbf{i}$ in the form $\mathbf{i} = (i_1, i_2, \ldots, i_\ell)$ for some positive integers i_1, i_2, $\ldots$, i_ℓ satisfying $i_1 < i_2 < \cdots < i_\ell$. Consider these i_1, i_2, $\ldots$, i_ℓ. Notice that i_1, i_2, $\ldots$, i_ℓ are distinct (since $i_1 < i_2 < \cdots < i_\ell$), so that the variables x_{i_1}, x_{i_2}, $\ldots$, x_{i_ℓ} are distinct.

The definition of $\mathbf{x}_\mathbf{i}^\alpha$ yields $\mathbf{x}_\mathbf{i}^\alpha = x_{i_1}^{\alpha_1} x_{i_2}^{\alpha_2} \cdots x_{i_\ell}^{\alpha_\ell}$. Thus, the variables x_{i_1}, x_{i_2}, $\ldots$, x_{i_ℓ} all occur in the monomial $\mathbf{x}_\mathbf{i}^\alpha$ (since their exponents α_1, α_2, $\ldots$, α_ℓ are positive), and no other variables do. In other words, the set of all variables which occur in the monomial $\mathbf{x}_\mathbf{i}^\alpha$ is $\left\{x_{i_1}, x_{i_2}, \ldots, x_{i_\ell}\right\}$. In other words, $\operatorname{Supp}\left(\mathbf{x}_\mathbf{i}^\alpha\right)$ is $\left\{x_{i_1}, x_{i_2}, \ldots, x_{i_\ell}\right\}$ (since $\operatorname{Supp}\left(\mathbf{x}_\mathbf{i}^\alpha\right)$ is the set of all variables which occur in the monomial $\mathbf{x}_\mathbf{i}^\alpha$ (by the definition of $\operatorname{Supp}\left(\mathbf{x}_\mathbf{i}^\alpha\right)$)). In other words, $\operatorname{Supp}\left(\mathbf{x}_\mathbf{i}^\alpha\right) = \left\{x_{i_1}, x_{i_2}, \ldots, x_{i_\ell}\right\}$, so that $\left|\operatorname{Supp}\left(\mathbf{x}_\mathbf{i}^\alpha\right)\right| = \left|\left\{x_{i_1}, x_{i_2}, \ldots, x_{i_\ell}\right\}\right| = \ell$ (since the variables x_{i_1}, x_{i_2}, $\ldots$, x_{i_ℓ} are distinct). This proves (13.179.25).]

We know that $\mathbf{i}_1$, $\mathbf{i}_2$, $\ldots$, $\mathbf{i}_s$ are not distinct. In other words, (at least) two of the elements $\mathbf{i}_1$, $\mathbf{i}_2$, $\ldots$, $\mathbf{i}_s$ are equal. In other words, there exist two distinct elements u and v of $\{1, 2, \ldots, s\}$ such that $\mathbf{i}_u = \mathbf{i}_v$. Consider these u and v. Notice that $u \in \{1, 2, \ldots, s\}$, so that $1 \leq u \leq s$ and thus $s \geq 1$.

Since u and v are distinct, we have $u \in \{1, 2, \ldots, s\} \setminus \{v\}$; thus, $\operatorname{Supp}\left(\mathbf{x}_{\mathbf{i}_u}^\alpha\right)$ is an addend of the union $\bigcup_{j\in\{1,2,\ldots,s\}\setminus\{v\}} \operatorname{Supp}\left(\mathbf{x}_{\mathbf{i}_j}^\alpha\right)$. Consequently, $\operatorname{Supp}\left(\mathbf{x}_{\mathbf{i}_u}^\alpha\right) \subset \bigcup_{j\in\{1,2,\ldots,s\}\setminus\{v\}} \operatorname{Supp}\left(\mathbf{x}_{\mathbf{i}_j}^\alpha\right)$. Since $\mathbf{i}_u = \mathbf{i}_v$, this rewrites as

$$(13.179.26) \qquad \operatorname{Supp}\left(\mathbf{x}_{\mathbf{i}_v}^\alpha\right) \subset \bigcup_{j\in\{1,2,\ldots,s\}\setminus\{v\}} \operatorname{Supp}\left(\mathbf{x}_{\mathbf{i}_j}^\alpha\right).$$

Now, (13.179.23) (applied to $k = s$ and $\mathbf{m}_j = \mathbf{x}_{\mathbf{i}_j}^\alpha$) yields

$$\operatorname{Supp}\left(\mathbf{x}_{\mathbf{i}_1}^\alpha \mathbf{x}_{\mathbf{i}_2}^\alpha \cdots \mathbf{x}_{\mathbf{i}_s}^\alpha\right) = \left(\operatorname{Supp}\left(\mathbf{x}_{\mathbf{i}_1}^\alpha\right)\right) \cup \left(\operatorname{Supp}\left(\mathbf{x}_{\mathbf{i}_2}^\alpha\right)\right) \cup \cdots \cup \left(\operatorname{Supp}\left(\mathbf{x}_{\mathbf{i}_s}^\alpha\right)\right)$$
$$= \bigcup_{j\in\{1,2,\ldots,s\}} \operatorname{Supp}\left(\mathbf{x}_{\mathbf{i}_j}^\alpha\right) = \left(\bigcup_{j\in\{1,2,\ldots,s\}\setminus\{v\}} \operatorname{Supp}\left(\mathbf{x}_{\mathbf{i}_j}^\alpha\right)\right) \cup \underbrace{\operatorname{Supp}\left(\mathbf{x}_{\mathbf{i}_v}^\alpha\right)}_{\substack{\subset \bigcup_{j\in\{1,2,\ldots,s\}\setminus\{v\}} \operatorname{Supp}\left(\mathbf{x}_{\mathbf{i}_j}^\alpha\right)\\ (\text{by } (13.179.26))}}$$

(here, we have split off the addend for $j = v$ from the union)

$$\subset \left(\bigcup_{j\in\{1,2,\ldots,s\}\setminus\{v\}} \operatorname{Supp}\left(\mathbf{x}_{\mathbf{i}_j}^\alpha\right)\right) \cup \left(\bigcup_{j\in\{1,2,\ldots,s\}\setminus\{v\}} \operatorname{Supp}\left(\mathbf{x}_{\mathbf{i}_j}^\alpha\right)\right)$$
$$= \bigcup_{j\in\{1,2,\ldots,s\}\setminus\{v\}} \operatorname{Supp}\left(\mathbf{x}_{\mathbf{i}_j}^\alpha\right).$$

Hence, if γ is a composition satisfying $|\gamma| \neq s\,|\alpha|$, then

$$c_\gamma = 0. \tag{13.179.28}$$

Also, if γ is a composition satisfying $\ell(\gamma) > (s-1)\,\ell(\alpha)$, then

$$\begin{aligned}
-c_\gamma &= \sum_{\substack{(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\in(\mathrm{SIS}(\ell))^s;\\ \mathbf{i}_1,\ \mathbf{i}_2,\ \ldots,\ \mathbf{i}_s \text{ are not distinct}}} \underbrace{\left(\text{the coefficient of the monomial } \mathbf{x}^\gamma \text{ in } \mathbf{x}_{\mathbf{i}_1}^\alpha \mathbf{x}_{\mathbf{i}_2}^\alpha \cdots \mathbf{x}_{\mathbf{i}_s}^\alpha\right)}_{\substack{=0\\ (\text{by (13.179.22)})}} \qquad (\text{by (13.179.19)})\\
&= \sum_{\substack{(\mathbf{i}_1,\mathbf{i}_2,\ldots,\mathbf{i}_s)\in(\mathrm{SIS}(\ell))^s;\\ \mathbf{i}_1,\ \mathbf{i}_2,\ \ldots,\ \mathbf{i}_s \text{ are not distinct}}} 0 = 0.
\end{aligned}$$

Hence, if γ is a composition satisfying $\ell(\gamma) > (s-1)\,\ell(\alpha)$, then

$$c_\gamma = 0. \tag{13.179.29}$$

Now, (13.179.18) becomes

$$\begin{aligned}
s!M_\alpha^{\langle s\rangle} - M_\alpha^s &= \sum_{\beta\in\mathrm{Comp}} c_\beta M_\beta = \underbrace{\sum_{\substack{\beta\in\mathrm{Comp};\\ |\beta|=s|\alpha|}}}_{\substack{=\sum_{\beta\in\mathrm{Comp}_{s|\alpha|}}\\ (\text{since the elements } \beta\in\mathrm{Comp}\\ \text{satisfying } |\beta|=s|\alpha| \text{ are exactly}\\ \text{the elements of } \mathrm{Comp}_{s|\alpha|})}} c_\beta M_\beta + \sum_{\substack{\beta\in\mathrm{Comp};\\ |\beta|\neq s|\alpha|}} \underbrace{c_\beta}_{\substack{=0\\ (\text{by (13.179.28)},\\ \text{applied to } \gamma=\beta)}} M_\beta\\
&\qquad \left(\begin{array}{c}\text{since every } \beta\in\mathrm{Comp} \text{ satisfies exactly one of the two}\\ \text{statements } |\beta| = s\,|\alpha| \text{ and } |\beta|\neq s\,|\alpha|\end{array}\right)\\
&= \sum_{\beta\in\mathrm{Comp}_{s|\alpha|}} c_\beta M_\beta + \underbrace{\sum_{\substack{\beta\in\mathrm{Comp};\\ |\beta|\neq s|\alpha|}} 0 M_\beta}_{=0} = \sum_{\beta\in\mathrm{Comp}_{s|\alpha|}} c_\beta M_\beta\\
&= \sum_{\substack{\beta\in\mathrm{Comp}_{s|\alpha|};\\ \ell(\beta)\leq(s-1)\ell(\alpha)}} c_\beta M_\beta + \sum_{\substack{\beta\in\mathrm{Comp}_{s|\alpha|};\\ \ell(\beta)>(s-1)\ell(\alpha)}} \underbrace{c_\beta}_{\substack{=0\\ (\text{by (13.179.29)},\\ \text{applied to } \gamma=\beta)}} M_\beta\\
&\qquad \left(\begin{array}{c}\text{since every } \beta\in\mathrm{Comp}_{s|\alpha|} \text{ satisfies exactly one of the two}\\ \text{statements } \ell(\beta)\leq(s-1)\,\ell(\alpha) \text{ and } \ell(\beta)>(s-1)\,\ell(\alpha)\end{array}\right)\\
&= \sum_{\substack{\beta\in\mathrm{Comp}_{s|\alpha|};\\ \ell(\beta)\leq(s-1)\ell(\alpha)}} c_\beta M_\beta + \underbrace{\sum_{\substack{\beta\in\mathrm{Comp}_{s|\alpha|};\\ \ell(\beta)>(s-1)\ell(\alpha)}} 0 M_\beta}_{=0} = \sum_{\substack{\beta\in\mathrm{Comp}_{s|\alpha|};\\ \ell(\beta)\leq(s-1)\ell(\alpha)}} \underbrace{c_\beta}_{\in\mathbf{k}} M_\beta \in \sum_{\substack{\beta\in\mathrm{Comp}_{s|\alpha|};\\ \ell(\beta)\leq(s-1)\ell(\alpha)}} \mathbf{k}M_\beta.
\end{aligned}$$

Thus,

$$\begin{aligned}
\left|\mathrm{Supp}\left(\mathbf{x}_{\mathbf{i}_1}^\alpha \mathbf{x}_{\mathbf{i}_2}^\alpha \cdots \mathbf{x}_{\mathbf{i}_s}^\alpha\right)\right| &\leq \left|\bigcup_{j\in\{1,2,\ldots,s\}\setminus\{v\}} \mathrm{Supp}\left(\mathbf{x}_{\mathbf{i}_j}^\alpha\right)\right| \leq \sum_{j\in\{1,2,\ldots,s\}\setminus\{v\}} \underbrace{\left|\mathrm{Supp}\left(\mathbf{x}_{\mathbf{i}_j}^\alpha\right)\right|}_{\substack{=\ell\\ (\text{by (13.179.25), applied to } \mathbf{i}=\mathbf{i}_j)}}\\
&= \sum_{j\in\{1,2,\ldots,s\}\setminus\{v\}} \ell = \underbrace{|\{1,2,\ldots,s\}\setminus\{v\}|}_{=s-1} \underbrace{\ell}_{=\ell(\alpha)} = (s-1)\,\ell(\alpha).
\end{aligned}$$

Thus,

$$(s-1)\,\ell(\alpha) \geq \left|\mathrm{Supp}\left(\mathbf{x}_{\mathbf{i}_1}^\alpha \mathbf{x}_{\mathbf{i}_2}^\alpha \cdots \mathbf{x}_{\mathbf{i}_s}^\alpha\right)\right|. \tag{13.179.27}$$

But (13.179.24) (applied to $\beta = \gamma$) yields $|\mathrm{Supp}(\mathbf{x}^\gamma)| = \ell(\gamma) > (s-1)\,\ell(\alpha) \geq \left|\mathrm{Supp}\left(\mathbf{x}_{\mathbf{i}_1}^\alpha \mathbf{x}_{\mathbf{i}_2}^\alpha \cdots \mathbf{x}_{\mathbf{i}_s}^\alpha\right)\right|$ (by (13.179.27)). Hence, $|\mathrm{Supp}(\mathbf{x}^\gamma)| \neq \left|\mathrm{Supp}\left(\mathbf{x}_{\mathbf{i}_1}^\alpha \mathbf{x}_{\mathbf{i}_2}^\alpha \cdots \mathbf{x}_{\mathbf{i}_s}^\alpha\right)\right|$, so that $\mathbf{x}^\gamma \neq \mathbf{x}_{\mathbf{i}_1}^\alpha \mathbf{x}_{\mathbf{i}_2}^\alpha \cdots \mathbf{x}_{\mathbf{i}_s}^\alpha$. Hence, $\mathbf{x}^\gamma$ and $\mathbf{x}_{\mathbf{i}_1}^\alpha \mathbf{x}_{\mathbf{i}_2}^\alpha \cdots \mathbf{x}_{\mathbf{i}_s}^\alpha$ are two distinct monomials. Therefore, $\left(\text{the coefficient of the monomial } \mathbf{x}^\gamma \text{ in } \mathbf{x}_{\mathbf{i}_1}^\alpha \mathbf{x}_{\mathbf{i}_2}^\alpha \cdots \mathbf{x}_{\mathbf{i}_s}^\alpha\right) = 0$. This proves (13.179.22).

This proves Lemma 6.5.16 once again. □

13.180. **Solution to Exercise 6.5.20.** *Solution to Exercise 6.5.20.*

Proof of Corollary 6.5.19. We know that u is a Lyndon word and satisfies $u = u$. Hence, (u) is the CFL factorization of the word u.

Define the notion $\operatorname{mult}_w z$ (for any Lyndon word w and any word z) as in Theorem 6.2.2(b).

Theorem 6.2.2(e) yields that the lexicographically highest element of the multiset $u \sqcup\!\sqcup v$ is uv, and the multiplicity with which this word uv appears in the multiset $u \sqcup\!\sqcup v$ is $\operatorname{mult}_u v + 1$.

Recall that $\operatorname{mult}_u v$ is the number of terms in the CFL factorization of v which are equal to u (by the definition of $\operatorname{mult}_u v$). In other words,

$$\begin{aligned}\operatorname{mult}_u v &= \left(\text{the number of terms in } \underbrace{\text{the CFL factorization of } v}_{=(b_1,b_2,\ldots,b_q)} \text{ which are equal to } u\right)\\ &= \left(\text{the number of terms in } (b_1, b_2, \ldots, b_q) \text{ which are equal to } u\right)\\ &= \left(\text{the number of } j \in \{1,2,\ldots,q\} \text{ satisfying } b_j = u\right) = \left|\{j \in \{1,2,\ldots,q\} \mid b_j = u\}\right|.\end{aligned}$$

Now, the multiplicity with which the word uv appears in the multiset $u \sqcup\!\sqcup v$ is

$$\begin{aligned}\underbrace{\operatorname{mult}_u v}_{=|\{j\in\{1,2,\ldots,q\} \mid b_j=u\}|} +1 &= \left|\{j \in \{1,2,\ldots,q\} \mid b_j = u\}\right| + 1\\ &= 1 + \left|\{j \in \{1,2,\ldots,q\} \mid b_j = u\}\right| = h.\end{aligned}$$

Hence, we can apply Lemma 6.5.18 to $z = uv$. As a result, we conclude that

$$M_u M_v = h M_{uv} + \left(\text{a sum of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_{n+m} \text{ satisfying } w \underset{\text{wll}}{<} uv\right).$$

This proves Corollary 6.5.19. □

13.181. **Solution to Exercise 6.5.22.** *Solution to Exercise 6.5.22.*

Proof of Corollary 6.5.21. Notice that $|x| = k$ (since $x \in \operatorname{Comp}_k$), thus $|x^s| = s \underbrace{|x|}_{=k} = sk$ and thus $x^s \in \operatorname{Comp}_{sk}$.

Clearly, (x) is the CFL factorization of the word x (since x is Lyndon). On the other hand, $\left(\underbrace{x, x, \ldots, x}_{s \text{ times}}\right)$ is the CFL factorization of the word x^s (since $\left(\underbrace{x, x, \ldots, x}_{s \text{ times}}\right)$ is a tuple of Lyndon words (since x is Lyndon) satisfying $x^s = \underbrace{xx \cdots x}_{s \text{ times}}$ and $x \geq x \geq \cdots \geq x$). Hence, Theorem 6.2.2(c) (applied to $u = x$, $v = x^s$, $p = 1$, $q = s$, $(a_1, a_2, \ldots, a_p) = (x)$ and $(b_1, b_2, \ldots, b_q) = \left(\underbrace{x, x, \ldots, x}_{s \text{ times}}\right)$) yields that the lexicographically highest element of the multiset $x \sqcup\!\sqcup x^s$ is xx^s (since $x \geq x$ for every $i \in \{1, 2, \ldots, 1\}$ and $j \in \{1, 2, \ldots, s\}$). In other words, the lexicographically highest element of the multiset $x \sqcup\!\sqcup x^s$ is x^{s+1} (since $xx^s = x^{s+1}$). This proves Corollary 6.5.21(a).

(c) Let $t \in \operatorname{Comp}_{sk}$ be such that $t \underset{\text{wll}}{<} x^s$. Then, Lemma 6.4.11(c) (applied to $n = k$, $m = sk$, $u = x$, $v = x^s$, $z = x^{s+1}$ and $v' = t$) yields

$$\begin{aligned} M_x M_t &= \left(\text{a sum of terms of the form } M_w \text{ with } w \in \underbrace{\operatorname{Comp}_{k+sk}}_{\substack{= \operatorname{Comp}_{(s+1)k} \\ (\text{since } k+sk=(s+1)k)}} \text{ satisfying } w \underset{\text{wll}}{<} x^{s+1} \right) \\ &= \left(\text{a sum of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_{(s+1)k} \text{ satisfying } w \underset{\text{wll}}{<} x^{s+1} \right). \end{aligned}$$

This proves Corollary 6.5.21(c).

(b) Let $h = 1 + \left| \left\{ j \in \{1, 2, \ldots, s\} \mid x = x \right\} \right|$. Of course, $h = s + 1$ [1173]. Recall that x is a Lyndon word, and that $\left(\underbrace{x, x, \ldots, x}_{s \text{ times}} \right)$ is the CFL factorization of the word x^s. Notice also that $x \geq x$ for every $j \in \{1, 2, \ldots, s\}$. Thus, Corollary 6.5.19 (applied to $n = k$, $m = sk$, $u = x$, $v = x^s$, $q = s$ and $(b_1, b_2, \ldots, b_q) = \left(\underbrace{x, x, \ldots, x}_{s \text{ times}} \right)$) yields that

$$\begin{aligned} M_x M_{x^s} = \underbrace{h}_{=s+1} \underbrace{M_{xx^s}}_{\substack{= M_{x^{s+1}} \\ (\text{since } xx^s = x^{s+1})}} \\ + \left(\text{a sum of terms of the form } M_w \text{ with } w \in \underbrace{\operatorname{Comp}_{k+sk}}_{\substack{= \operatorname{Comp}_{(s+1)k} \\ (\text{since } k+sk=(s+1)k)}} \text{ satisfying } w \underset{\text{wll}}{<} \underbrace{xx^s}_{=x^{s+1}} \right) \\ = (s+1) M_{x^{s+1}} + \left(\text{a sum of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_{(s+1)k} \text{ satisfying } w \underset{\text{wll}}{<} x^{s+1} \right). \end{aligned}$$

This proves Corollary 6.5.21(b). □

13.182. **Solution to Exercise 6.5.24.** *Solution to Exercise 6.5.24.*

Proof of Corollary 6.5.23. We assumed that $a_i > b_j$ for every $i \in \{1, 2, \ldots, p\}$ and $j \in \{1, 2, \ldots, q\}$. Thus, $a_i \geq b_j$ for every $i \in \{1, 2, \ldots, p\}$ and $j \in \{1, 2, \ldots, q\}$. Hence, the lexicographically highest element of the multiset $u \sqcup\!\sqcup v$ is uv (by Theorem 6.2.2(c)). Also, the multiplicity with which the word uv appears in the multiset $u \sqcup\!\sqcup v$ is 1 (by Theorem 6.2.2(d)). Hence, Lemma 6.5.18 (applied to $z = uv$ and $h = 1$) yields

$$\begin{aligned} M_u M_v &= \underbrace{1 M_{uv}}_{= M_{uv}} + \left(\text{a sum of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_{n+m} \text{ satisfying } w \underset{\text{wll}}{<} uv \right) \\ &= M_{uv} + \left(\text{a sum of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_{n+m} \text{ satisfying } w \underset{\text{wll}}{<} uv \right). \end{aligned}$$

This proves Corollary 6.5.23. □

[1173] *Proof.* Every $j \in \{1, 2, \ldots, s\}$ satisfies $x = x$. Hence, the set $\{ j \in \{1, 2, \ldots, s\} \mid x = x \}$ equals the whole $\{1, 2, \ldots, s\}$. In other words, $\{ j \in \{1, 2, \ldots, s\} \mid x = x \} = \{1, 2, \ldots, s\}$. Now, $h = 1 + \left| \underbrace{\{ j \in \{1, 2, \ldots, s\} \mid x = x \}}_{= \{1, 2, \ldots, s\}} \right| = 1 + \underbrace{|\{1, 2, \ldots, s\}|}_{=s} = 1 + s = s + 1$, qed.

13.183. **Solution to Exercise 6.5.26.** *Solution to Exercise 6.5.26.*

Proof of Corollary 6.5.25. The tuple $(a_1, a_2, \ldots, a_p)$ is the CFL factorization of u. Thus, $(a_1, a_2, \ldots, a_p)$ is a tuple of Lyndon words satisfying $u = a_1 a_2 \cdots a_p$ and $a_1 \geq a_2 \geq \cdots \geq a_p$.

Now, $(a_1, a_2, \ldots, a_k)$ is a tuple of Lyndon words (since $(a_1, a_2, \ldots, a_p)$ is a tuple of Lyndon words) satisfying $x = a_1 a_2 \cdots a_k$ and $a_1 \geq a_2 \geq \cdots \geq a_k$ (since $a_1 \geq a_2 \geq \cdots \geq a_p$). In other words, $(a_1, a_2, \ldots, a_k)$ is the CFL factorization of x (by the definition of a CFL factorization).

Also, $(a_{k+1}, a_{k+2}, \ldots, a_p)$ is a tuple of Lyndon words (since $(a_1, a_2, \ldots, a_p)$ is a tuple of Lyndon words) satisfying $y = a_{k+1} a_{k+2} \cdots a_p$ and $a_{k+1} \geq a_{k+2} \geq \cdots \geq a_p$ (since $a_1 \geq a_2 \geq \cdots \geq a_p$). In other words, $(a_{k+1}, a_{k+2}, \ldots, a_p)$ is the CFL factorization of y (by the definition of a CFL factorization).

We have $x \in \operatorname{Comp}_{|x|}$ and $y \in \operatorname{Comp}_{|y|}$. Also, multiplying the equalities $x = a_1 a_2 \cdots a_k$ and $y = a_{k+1} a_{k+2} \cdots a_p$, we obtain $xy = (a_1 a_2 \cdots a_k)(a_{k+1} a_{k+2} \cdots a_p) = a_1 a_2 \cdots a_p = u$. Thus, $|x| + |y| = \left| \underbrace{xy}_{=u} \right| = |u| = n$ (since $u \in \operatorname{Comp}_n$).

We have $a_i > a_{k+j}$ for every $i \in \{1, 2, \ldots, k\}$ and $j \in \{1, 2, \ldots, p-k\}$ [1174]. Hence, Corollary 6.5.23 (applied to x, y, $|x|$, $|y|$, k, $p-k$, $(a_1, a_2, \ldots, a_k)$ and $(a_{k+1}, a_{k+2}, \ldots, a_p)$ instead of u, v, n, m, p, q, $(a_1, a_2, \ldots, a_p)$ and $(b_1, b_2, \ldots, b_q)$) yields

$$M_x M_y = \underbrace{M_{xy}}_{\substack{=M_u \\ (\text{since } xy=u)}} + \left(\text{a sum of terms of the form } M_w \text{ with } w \in \underbrace{\operatorname{Comp}_{|x|+|y|}}_{\substack{=\operatorname{Comp}_n \\ (\text{since } |x|+|y|=n)}} \text{ satisfying } w \underset{\text{wll}}{<} \underbrace{xy}_{=u} \right)$$
$$= M_u + \left(\text{a sum of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_n \text{ satisfying } w \underset{\text{wll}}{<} u \right).$$

Thus,

$$M_u = M_x M_y - \left(\text{a sum of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_n \text{ satisfying } w \underset{\text{wll}}{<} u \right).$$

This proves Corollary 6.5.25. □

13.184. **Solution to Exercise 6.5.28.** *Solution to Exercise 6.5.28.*

Proof of Corollary 6.5.27. We shall prove Corollary 6.5.27 by induction over s:

Induction base: We have $x^0 = \varnothing$ and therefore $M_{x^0} = M_\varnothing = 1$. Now, $\underbrace{M_x^0}_{=1} - \underbrace{0!}_{=1} \underbrace{M_{x^0}}_{=1} = 1 - 1 = 0 \in \sum_{\substack{w \in \operatorname{Comp}_{0k}; \\ w \underset{\text{wll}}{<} x^0}} \mathbf{k} M_w$. In other words, Corollary 6.5.27 holds for $s = 0$. This completes the induction base.

Induction step: Let $\mathbf{S}$ be a nonnegative integer. Assume that Corollary 6.5.27 holds for $s = \mathbf{S}$. We need to prove that Corollary 6.5.27 holds for $s = \mathbf{S} + 1$.

Notice that $x \in \operatorname{Comp}_k$, thus $|x| = k$, and thus $\left| x^{\mathbf{S}} \right| = \mathbf{S} \underbrace{|x|}_{=k} = \mathbf{S} k$, so that $x^{\mathbf{S}} \in \operatorname{Comp}_{\mathbf{S}k}$.

[1174] *Proof.* Recall that $a_1 \geq a_2 \geq \cdots \geq a_p$. Thus,

$$a_s \geq a_t \qquad \text{for any } s \in \{1, 2, \ldots, p\} \text{ and } t \in \{1, 2, \ldots, p\} \text{ satisfying } s \leq t. \tag{13.183.1}$$

Let $i \in \{1, 2, \ldots, k\}$ and $j \in \{1, 2, \ldots, p-k\}$. Then, $i \leq k$ (since $i \in \{1, 2, \ldots, k\}$) and thus $a_i \geq a_k$ (by (13.183.1), applied to $s = i$ and $t = k$). Also, $j \geq 1$ (since $j \in \{1, 2, \ldots, p-k\}$), and thus $k + \underbrace{j}_{\geq 1} \geq k + 1$, so that $k + 1 \leq k + j$. Hence, $a_{k+1} \geq a_{k+j}$ (by (13.183.1), applied to $s = k+1$ and $t = k+j$). Now, $a_i \geq a_k > a_{k+1} \geq a_{k+j}$, qed.

We know that Corollary 6.5.27 holds for $s = \mathbf{S}$. In other words,

$$M_x^{\mathbf{S}} - \mathbf{S}! M_{x^{\mathbf{S}}} \in \sum_{\substack{w \in \operatorname{Comp}_{\mathbf{S}k}; \\ w \underset{\text{wll}}{<} x^{\mathbf{S}}}} \mathbf{k} M_w = \sum_{\substack{t \in \operatorname{Comp}_{\mathbf{S}k}; \\ t \underset{\text{wll}}{<} x^{\mathbf{S}}}} \mathbf{k} M_t \tag{13.184.1}$$

(here, we renamed the summation index w as t).

Using Corollary 6.5.21(c), it is easy to see that

$$M_x M_t \in \sum_{\substack{w \in \operatorname{Comp}_{(\mathbf{S}+1)k}; \\ w \underset{\text{wll}}{<} x^{\mathbf{S}+1}}} \mathbf{k} M_w \qquad \text{for every } t \in \operatorname{Comp}_{\mathbf{S}k} \text{ satisfying } t \underset{\text{wll}}{<} x^{\mathbf{S}}. \tag{13.184.2}$$

[1175] Now,

$$M_x \left(M_x^{\mathbf{S}} - \mathbf{S}! M_{x^{\mathbf{S}}}\right) = \underbrace{M_x M_x^{\mathbf{S}}}_{= M_x^{\mathbf{S}+1}} - \mathbf{S}! M_x M_{x^{\mathbf{S}}} = M_x^{\mathbf{S}+1} - \mathbf{S}! M_x M_{x^{\mathbf{S}}},$$

so that

$$\begin{aligned}
M_x^{\mathbf{S}+1} - \mathbf{S}! M_x M_{x^{\mathbf{S}}} &= M_x \underbrace{\left(M_x^{\mathbf{S}} - \mathbf{S}! M_{x^{\mathbf{S}}}\right)}_{\substack{\in \sum_{\substack{t \in \operatorname{Comp}_{\mathbf{S}k}; \\ t \underset{\text{wll}}{<} x^{\mathbf{S}}}} \mathbf{k} M_t \\ (\text{by } (13.184.1))}} \in M_x \left(\sum_{\substack{t \in \operatorname{Comp}_{\mathbf{S}k}; \\ t \underset{\text{wll}}{<} x^{\mathbf{S}}}} \mathbf{k} M_t \right) \\
&= \sum_{\substack{t \in \operatorname{Comp}_{\mathbf{S}k}; \\ t \underset{\text{wll}}{<} x^{\mathbf{S}}}} \mathbf{k} \underbrace{M_x M_t}_{\substack{\in \sum_{\substack{w \in \operatorname{Comp}_{(\mathbf{S}+1)k}; \\ w \underset{\text{wll}}{<} x^{\mathbf{S}+1}}} \mathbf{k} M_w \\ (\text{by } (13.184.2))}} \subset \sum_{\substack{t \in \operatorname{Comp}_{\mathbf{S}k}; \\ t \underset{\text{wll}}{<} x^{\mathbf{S}}}} \mathbf{k} \left(\sum_{\substack{w \in \operatorname{Comp}_{(\mathbf{S}+1)k}; \\ w \underset{\text{wll}}{<} x^{\mathbf{S}+1}}} \mathbf{k} M_w \right) \\
&\subset \sum_{\substack{w \in \operatorname{Comp}_{(\mathbf{S}+1)k}; \\ w \underset{\text{wll}}{<} x^{\mathbf{S}+1}}} \mathbf{k} M_w \qquad \left(\text{since } \sum_{\substack{w \in \operatorname{Comp}_{(\mathbf{S}+1)k}; \\ w \underset{\text{wll}}{<} x^{\mathbf{S}+1}}} \mathbf{k} M_w \text{ is a } \mathbf{k}\text{-module} \right).
\end{aligned} \tag{13.184.3}$$

Now, Corollary 6.5.21(b) (applied to $s = \mathbf{S}$) yields

$$M_x M_{x^{\mathbf{S}}} = (\mathbf{S}+1) M_{x^{\mathbf{S}+1}} + \left(\text{a sum of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_{(\mathbf{S}+1)k} \text{ satisfying } w \underset{\text{wll}}{<} x^{\mathbf{S}+1} \right).$$

[1175] *Proof of (13.184.2):* Let $t \in \operatorname{Comp}_{\mathbf{S}k}$ be such that $t \underset{\text{wll}}{<} x^{\mathbf{S}}$. Then, Corollary 6.5.21(c) (applied to $s = \mathbf{S}$) yields

$$\begin{aligned}
M_x M_t &= \left(\text{a sum of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_{(\mathbf{S}+1)k} \text{ satisfying } w \underset{\text{wll}}{<} x^{\mathbf{S}+1} \right) \\
&\in \sum_{\substack{w \in \operatorname{Comp}_{(\mathbf{S}+1)k}; \\ w \underset{\text{wll}}{<} x^{\mathbf{S}+1}}} \mathbf{k} M_w .
\end{aligned}$$

This proves (13.184.2).

Thus,

$$\begin{aligned}
&M_x M_{x^{\mathbf{S}}} - (\mathbf{S}+1)\, M_{x^{\mathbf{S}+1}} \\
&= \left(\text{a sum of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_{(\mathbf{S}+1)k} \text{ satisfying } w \underset{\text{wll}}{<} x^{\mathbf{S}+1}\right) \\
&\in \sum_{\substack{w \in \operatorname{Comp}_{(\mathbf{S}+1)k};\\ w \underset{\text{wll}}{<} x^{\mathbf{S}+1}}} \mathbf{k} M_w . \qquad (13.184.4)
\end{aligned}$$

Now,

$$\begin{aligned}
M_x^{\mathbf{S}+1} - (\mathbf{S}+1)! M_{x^{\mathbf{S}+1}} &= \left(M_x^{\mathbf{S}+1} - \mathbf{S}! M_x M_{x^{\mathbf{S}}}\right) + \left(\mathbf{S}! M_x M_{x^{\mathbf{S}}} - \underbrace{(\mathbf{S}+1)!}_{=\mathbf{S}! \cdot (\mathbf{S}+1)} M_{x^{\mathbf{S}+1}}\right) \\
&= \left(M_x^{\mathbf{S}+1} - \mathbf{S}! M_x M_{x^{\mathbf{S}}}\right) + \underbrace{\left(\mathbf{S}! M_x M_{x^{\mathbf{S}}} - \mathbf{S}! \cdot (\mathbf{S}+1)\, M_{x^{\mathbf{S}+1}}\right)}_{=\mathbf{S}! \cdot \left(M_x M_{x^{\mathbf{S}}} - (\mathbf{S}+1) M_{x^{\mathbf{S}+1}}\right)} \\
&= \underbrace{\left(M_x^{\mathbf{S}+1} - \mathbf{S}! M_x M_{x^{\mathbf{S}}}\right)}_{\substack{\in \sum_{\substack{w \in \operatorname{Comp}_{(\mathbf{S}+1)k};\\ w \underset{\text{wll}}{<} x^{\mathbf{S}+1}}} \mathbf{k} M_w \\ \text{(by (13.184.3))}}} + \mathbf{S}! \cdot \underbrace{\left(M_x M_{x^{\mathbf{S}}} - (\mathbf{S}+1)\, M_{x^{\mathbf{S}+1}}\right)}_{\substack{\in \sum_{\substack{w \in \operatorname{Comp}_{(\mathbf{S}+1)k};\\ w \underset{\text{wll}}{<} x^{\mathbf{S}+1}}} \mathbf{k} M_w \\ \text{(by (13.184.4))}}} \\
&\in \sum_{\substack{w \in \operatorname{Comp}_{(\mathbf{S}+1)k};\\ w \underset{\text{wll}}{<} x^{\mathbf{S}+1}}} \mathbf{k} M_w + \mathbf{S}! \cdot \sum_{\substack{w \in \operatorname{Comp}_{(\mathbf{S}+1)k};\\ w \underset{\text{wll}}{<} x^{\mathbf{S}+1}}} \mathbf{k} M_w \subset \sum_{\substack{w \in \operatorname{Comp}_{(\mathbf{S}+1)k};\\ w \underset{\text{wll}}{<} x^{\mathbf{S}+1}}} \mathbf{k} M_w
\end{aligned}$$

(since $\sum_{\substack{w \in \operatorname{Comp}_{(\mathbf{S}+1)k};\\ w \underset{\text{wll}}{<} x^{\mathbf{S}+1}}} \mathbf{k} M_w$ is a $\mathbf{k}$-module). In other words, Corollary 6.5.27 holds for $s = \mathbf{S}+1$. This completes the induction step. Thus, Corollary 6.5.27 is proven by induction. □

13.185. **Solution to Exercise 6.5.30.** *Solution to Exercise 6.5.30.*

Proof of Corollary 6.5.29. We first assume that $\mathbf{k} = \mathbb{Z}$.

Notice that $|x| = k$ (since $x \in \operatorname{Comp}_k$). Also, $M_x^{\langle s \rangle} \in \operatorname{QSym}$ (by Corollary 6.5.8(a), applied to $\alpha = x$) and thus $\underbrace{M_x^{\langle s \rangle}}_{\in \operatorname{QSym}} - \underbrace{M_{x^s}}_{\in \operatorname{QSym}} \in \operatorname{QSym} - \operatorname{QSym} \subset \operatorname{QSym}$.

Corollary 6.5.27 yields

$$M_x^s - s! M_{x^s} \in \sum_{\substack{w \in \operatorname{Comp}_{sk};\\ w \underset{\text{wll}}{<} x^s}} \mathbf{k} M_w . \qquad (13.185.1)$$

On the other hand, the composition x is Lyndon and therefore nonempty. Hence, (6.5.2) (applied to $\alpha = x$) yields

$$s! M_x^{\langle s \rangle} - M_x^s \in \underbrace{\sum_{\substack{\beta \in \operatorname{Comp}_{s|x|};\\ \ell(\beta) \leq (s-1)\ell(x)}} \mathbf{k} M_\beta}_{\substack{= \sum_{\substack{\beta \in \operatorname{Comp}_{sk};\\ \ell(\beta) \leq (s-1)\ell(x)}} \\ \text{(since } |x| = k)}} = \sum_{\substack{\beta \in \operatorname{Comp}_{sk};\\ \ell(\beta) \leq (s-1)\ell(x)}} \mathbf{k} M_\beta = \sum_{\substack{w \in \operatorname{Comp}_{sk};\\ \ell(w) \leq (s-1)\ell(x)}} \mathbf{k} M_w$$

(here, we renamed the summation index β as w). But every $w \in \operatorname{Comp}_{sk}$ satisfying $\ell(w) \leq (s-1)\ell(x)$ must also satisfy $w \underset{\text{wll}}{<} x^s$ [1176]. Hence, the sum $\sum_{\substack{w \in \operatorname{Comp}_{sk};\\ \ell(w) \leq (s-1)\ell(x)}} \mathbf{k} M_w$ is a subsum of the sum $\sum_{\substack{w \in \operatorname{Comp}_{sk};\\ w \underset{\text{wll}}{<} x^s}} \mathbf{k} M_w$. Thus, $\sum_{\substack{w \in \operatorname{Comp}_{sk};\\ \ell(w) \leq (s-1)\ell(x)}} \mathbf{k} M_w \subset \sum_{\substack{w \in \operatorname{Comp}_{sk};\\ w \underset{\text{wll}}{<} x^s}} \mathbf{k} M_w$. Thus,

$$s! M_x^{\langle s\rangle} - M_x^s \in \sum_{\substack{w \in \operatorname{Comp}_{sk};\\ \ell(w) \leq (s-1)\ell(x)}} \mathbf{k} M_w \subset \sum_{\substack{w \in \operatorname{Comp}_{sk};\\ w \underset{\text{wll}}{<} x^s}} \mathbf{k} M_w. \tag{13.185.2}$$

Now,

$$s!\left(M_x^{\langle s\rangle} - M_{x^s}\right) = s! M_x^{\langle s\rangle} - s! M_{x^s} = \underbrace{\left(s! M_x^{\langle s\rangle} - M_x^s\right)}_{\substack{\in \sum_{\substack{w \in \operatorname{Comp}_{sk};\\ w \underset{\text{wll}}{<} x^s}} \mathbf{k} M_w \\ \text{(by (13.185.2))}}} + \underbrace{\left(M_x^s - s! M_{x^s}\right)}_{\substack{\in \sum_{\substack{w \in \operatorname{Comp}_{sk};\\ w \underset{\text{wll}}{<} x^s}} \mathbf{k} M_w \\ \text{(by (13.185.1))}}}$$

$$\in \sum_{\substack{w \in \operatorname{Comp}_{sk};\\ w \underset{\text{wll}}{<} x^s}} \mathbf{k} M_w + \sum_{\substack{w \in \operatorname{Comp}_{sk};\\ w \underset{\text{wll}}{<} x^s}} \mathbf{k} M_w \subset \sum_{\substack{w \in \operatorname{Comp}_{sk};\\ w \underset{\text{wll}}{<} x^s}} \mathbf{k} M_w \tag{13.185.3}$$

(since $\sum_{\substack{w \in \operatorname{Comp}_{sk};\\ w \underset{\text{wll}}{<} x^s}} \mathbf{k} M_w$ is a $\mathbf{k}$-module).

But recall that we assumed that $\mathbf{k} = \mathbb{Z}$. Hence, if N is a positive integer and if f is an element of QSym satisfying $Nf \in \sum_{\substack{w \in \operatorname{Comp}_{sk};\\ w \underset{\text{wll}}{<} x^s}} \mathbf{k} M_w$, then $f \in \sum_{\substack{w \in \operatorname{Comp}_{sk};\\ w \underset{\text{wll}}{<} x^s}} \mathbf{k} M_w$ [1177]. Applying this to $N = s!$ and

[1176] *Proof.* Let $w \in \operatorname{Comp}_{sk}$. Notice that $|x^s| = s \underbrace{|x|}_{=k} = sk$, so that $x^s \in \operatorname{Comp}_{sk}$. Now, we have $\ell(x) > 0$ (since x is nonempty), and

$$\ell(x^s) = s\ell(x) = (s-1)\ell(x) + \underbrace{\ell(x)}_{>0} > (s-1)\ell(x).$$

Thus, $(s-1)\ell(x) < \ell(x^s)$, so that $\ell(w) \leq (s-1)\ell(x) < \ell(x^s)$.

But the definition of the wll-order shows that if $n \in \mathbb{N}$, and if α and β are two elements of Comp_n satisfying $\ell(\alpha) < \ell(\beta)$, then $\alpha \underset{\text{wll}}{<} \beta$. Applying this to $\alpha = w$ and $\beta = x^s$, we obtain $w \underset{\text{wll}}{<} x^s$ (since $\ell(w) < \ell(x^s)$), qed.

[1177] *Proof.* Let N be a positive integer. Let f be an element of QSym satisfying $Nf \in \sum_{\substack{w \in \operatorname{Comp}_{sk};\\ w \underset{\text{wll}}{<} x^s}} \mathbf{k} M_w$.

We know that $(M_\alpha)_{\alpha \in \operatorname{Comp}}$ is a basis of the $\mathbf{k}$-module QSym. In the following, whenever $g \in \operatorname{QSym}$ and $\beta \in \operatorname{Comp}$, we will let $\operatorname{coord}_{M_\beta} g$ denote the M_β-coordinate of g with respect to the basis $(M_\alpha)_{\alpha \in \operatorname{Comp}}$ of QSym. Then, every $g \in \operatorname{QSym}$ satisfies

$$g = \sum_{\beta \in \operatorname{Comp}} \left(\operatorname{coord}_{M_\beta} g\right) M_\beta \tag{13.185.4}$$

(by the definition of coordinates). Notice also that

$$\operatorname{coord}_{M_\beta}(M_\gamma) = \delta_{\beta,\gamma} \qquad \text{for every compositions } \beta \text{ and } \gamma. \tag{13.185.5}$$

Now, $Nf \in \sum_{\substack{w \in \operatorname{Comp}_{sk};\\ w \underset{\text{wll}}{<} x^s}} \mathbf{k} M_w$. Thus, there exists a family $(\lambda_w)_{\substack{w \in \operatorname{Comp}_{sk};\\ w \underset{\text{wll}}{<} x^s}} \in \mathbf{k}^{\left\{w \in \operatorname{Comp}_{sk} \ \mid \ w \underset{\text{wll}}{<} x^s\right\}}$ of elements of $\mathbf{k}$ satisfying $Nf = \sum_{\substack{w \in \operatorname{Comp}_{sk};\\ w \underset{\text{wll}}{<} x^s}} \lambda_w M_w$. Consider this family $(\lambda_w)_{\substack{w \in \operatorname{Comp}_{sk};\\ w \underset{\text{wll}}{<} x^s}}$.

Let β be a composition such that we don't have $\left(\beta \in \operatorname{Comp}_{sk} \text{ and } \beta \underset{\text{wll}}{<} x^s\right)$. Then,

$$\text{every composition } w \in \operatorname{Comp}_{sk} \text{ satisfying } w \underset{\text{wll}}{<} x^s \text{ satisfies } \beta \neq w \tag{13.185.6}$$

$f = M_x^{\langle s \rangle} - M_{x^s}$, we obtain $M_x^{\langle s \rangle} - M_{x^s} \in \sum\limits_{\substack{w \in \operatorname{Comp}_{sk}; \\ w \underset{\mathrm{wll}}{<} x^s}} \mathbf{k} M_w$ (because of (13.185.3)). In other words, Corollary 6.5.29 holds under the assumption that $\mathbf{k} = \mathbb{Z}$.

Now, let us forget that we have assumed that $\mathbf{k} = \mathbb{Z}$. We thus have shown that Corollary 6.5.29 holds under the assumption that $\mathbf{k} = \mathbb{Z}$. In other words, we have shown that the relation

$$M_x^{\langle s \rangle} - M_{x^s} \in \sum_{\substack{w \in \operatorname{Comp}_{sk}; \\ w \underset{\mathrm{wll}}{<} x^s}} \mathbb{Z} M_w \tag{13.185.8}$$

holds in $\mathbb{Z}[[\mathbf{x}]]$.

Now, recall that there is a canonical ring homomorphism $\varphi : \mathbb{Z} \to \mathbf{k}$. This homomorphism gives rise to a ring homomorphism $\varphi[[\mathbf{x}]] : \mathbb{Z}[[\mathbf{x}]] \to \mathbf{k}[[\mathbf{x}]]$, and this latter homomorphism $\varphi[[\mathbf{x}]]$ has the properties that:

- it is $\mathbb{Z}$-linear;
- it sends the element M_α of $\mathbb{Z}[[\mathbf{x}]]$ to the element M_α of $\mathbf{k}[[\mathbf{x}]]$ for every composition α;

(since every such w satisfies $\left(w \in \operatorname{Comp}_{sk} \text{ and } w \underset{\mathrm{wll}}{<} x^s \right)$, whereas β does not satisfy $\left(\beta \in \operatorname{Comp}_{sk} \text{ and } \beta \underset{\mathrm{wll}}{<} x^s \right)$). Now,

$$\operatorname{coord}_{M_\beta} \left(\underbrace{Nf}_{= \sum\limits_{\substack{w \in \operatorname{Comp}_{sk}; \\ w \underset{\mathrm{wll}}{<} x^s}} \lambda_w M_w} \right) = \operatorname{coord}_{M_\beta} \left(\sum_{\substack{w \in \operatorname{Comp}_{sk}; \\ w \underset{\mathrm{wll}}{<} x^s}} \lambda_w M_w \right) = \sum_{\substack{w \in \operatorname{Comp}_{sk}; \\ w \underset{\mathrm{wll}}{<} x^s}} \lambda_w \underbrace{\operatorname{coord}_{M_\beta}(M_w)}_{\substack{= \delta_{\beta, w} \\ \text{(by (13.185.5), applied} \\ \text{to } \gamma = w)}}$$
$$= \sum_{\substack{w \in \operatorname{Comp}_{sk}; \\ w \underset{\mathrm{wll}}{<} x^s}} \lambda_w \underbrace{\delta_{\beta, w}}_{\substack{=0 \\ \text{(since } \beta \neq w \\ \text{(by (13.185.6)))}}} = \sum_{\substack{w \in \operatorname{Comp}_{sk}; \\ w \underset{\mathrm{wll}}{<} x^s}} \lambda_w 0 = 0.$$

Compared with $\operatorname{coord}_{M_\beta}(Nf) = N \operatorname{coord}_{M_\beta} f$, this yields $N \operatorname{coord}_{M_\beta} f = 0$.

But N is a positive integer. Thus, if an element ρ of $\mathbb{Z}$ satisfies $N\rho = 0$, then $\rho = 0$. Applying this to $\rho = \operatorname{coord}_{M_\beta} f$, we obtain $\operatorname{coord}_{M_\beta} f = 0$ (since $\operatorname{coord}_{M_\beta} f \in \mathbf{k} = \mathbb{Z}$ and $N \operatorname{coord}_{M_\beta} f = 0$).

Now, let us forget that we fixed β. We thus have shown that if β is a composition such that we don't have $\left(\beta \in \operatorname{Comp}_{sk} \text{ and } \beta \underset{\mathrm{wll}}{<} x^s \right)$, then

$$\operatorname{coord}_{M_\beta} f = 0. \tag{13.185.7}$$

Now, (13.185.4) (applied to $g = f$) yields

$$f = \sum_{\beta \in \operatorname{Comp}} \left(\operatorname{coord}_{M_\beta} f \right) M_\beta = \underbrace{\sum_{\substack{\beta \in \operatorname{Comp}; \\ \beta \in \operatorname{Comp}_{sk} \text{ and } \beta \underset{\mathrm{wll}}{<} x^s}}}_{\substack{= \sum\limits_{\substack{\beta \in \operatorname{Comp}_{sk}; \\ \beta \underset{\mathrm{wll}}{<} x^s}} \\ \text{(since every } \beta \in \operatorname{Comp}_{sk} \\ \text{satisfies } \beta \in \operatorname{Comp})}} \left(\operatorname{coord}_{M_\beta} f \right) M_\beta + \sum_{\substack{\beta \in \operatorname{Comp}; \\ \text{we don't have } \left(\beta \in \operatorname{Comp}_{sk} \text{ and } \beta \underset{\mathrm{wll}}{<} x^s \right)}} \underbrace{\left(\operatorname{coord}_{M_\beta} f \right)}_{\substack{=0 \\ \text{(by (13.185.7))}}} M_\beta$$
$$= \sum_{\substack{\beta \in \operatorname{Comp}_{sk}; \\ \beta \underset{\mathrm{wll}}{<} x^s}} \left(\operatorname{coord}_{M_\beta} f \right) M_\beta + \underbrace{\sum_{\substack{\beta \in \operatorname{Comp}; \\ \text{we don't have } \left(\beta \in \operatorname{Comp}_{sk} \text{ and } \beta \underset{\mathrm{wll}}{<} x^s \right)}} 0 M_\beta}_{=0} = \sum_{\substack{\beta \in \operatorname{Comp}_{sk}; \\ \beta \underset{\mathrm{wll}}{<} x^s}} \left(\operatorname{coord}_{M_\beta} f \right) M_\beta$$
$$= \sum_{\substack{w \in \operatorname{Comp}_{sk}; \\ w \underset{\mathrm{wll}}{<} x^s}} \underbrace{\left(\operatorname{coord}_{M_w} f \right)}_{\in \mathbf{k}} M_w \qquad \text{(here, we renamed the summation index } \beta \text{ as } w\text{)}$$
$$\in \sum_{\substack{w \in \operatorname{Comp}_{sk}; \\ w \underset{\mathrm{wll}}{<} x^s}} \mathbf{k} M_w,$$

qed.

- it sends the element $M_\alpha^{\langle s\rangle}$ of $\mathbb{Z}[[\mathbf{x}]]$ to the element $M_\alpha^{\langle s\rangle}$ of $\mathbf{k}[[\mathbf{x}]]$ for every composition α and every nonnegative integer s.

Hence, by applying the homomorphism $\varphi[[\mathbf{x}]]$ to both sides of (13.185.8), we obtain

$$M_x^{\langle s\rangle} - M_{x^s} \in \sum_{\substack{w\in\operatorname{Comp}_{sk};\\ w \underset{\text{wll}}{<} x^s}} \underbrace{\mathbb{Z}M_w}_{\substack{\subset \mathbf{k}M_w\\ \text{(due to the canonical}\\ \text{ring homomorphism } \mathbb{Z}\to\mathbf{k})}} \subset \sum_{\substack{w\in\operatorname{Comp}_{sk};\\ w \underset{\text{wll}}{<} x^s}} \mathbf{k}M_w .$$

This proves Corollary 6.5.29. □

13.186. **Solution to Exercise 6.5.31.** *Solution to Exercise 6.5.31.*

Proof of Theorem 6.5.13. The family $\left(M_w^{\langle s\rangle}\right)_{(w,s)\in\mathfrak{RL}\times\{1,2,3,\ldots\}}$ is a reindexing of the family $\left(M_{\operatorname{red}\alpha}^{\langle\gcd\alpha\rangle}\right)_{\alpha\in\mathfrak{L}}$ (according to Lemma 6.5.14). In other words, the family $\left(M_w^{\langle s\rangle}\right)_{(w,s)\in\mathfrak{RL}\times\{1,2,3,\ldots\}}$ is a reindexing of the family $\left(M_{\operatorname{red}w}^{\langle\gcd w\rangle}\right)_{w\in\mathfrak{L}}$ (here, we renamed the index α as w).

We need to show that the family $\left(M_w^{\langle s\rangle}\right)_{(w,s)\in\mathfrak{RL}\times\{1,2,3,\ldots\}}$ is an algebraically independent generating set of the $\mathbf{k}$-algebra QSym. It is enough to prove that the family $\left(M_{\operatorname{red}w}^{\langle\gcd w\rangle}\right)_{w\in\mathfrak{L}}$ is an algebraically independent generating set of the $\mathbf{k}$-algebra QSym (since the family $\left(M_w^{\langle s\rangle}\right)_{(w,s)\in\mathfrak{RL}\times\{1,2,3,\ldots\}}$ is a reindexing of the family $\left(M_{\operatorname{red}w}^{\langle\gcd w\rangle}\right)_{w\in\mathfrak{L}}$). We shall prove the latter claim.

Indeed, the main difficulty is to show that

$$\text{the family } \left(M_{\operatorname{red}w}^{\langle\gcd w\rangle}\right)_{w\in\mathfrak{L}} \text{ generates the } \mathbf{k}\text{-algebra QSym}. \tag{13.186.1}$$

Once (13.186.1) is proven, we will be able to complete the proof of Theorem 6.5.13 as follows:

For every $w\in\mathfrak{L}$, we have $M_{\operatorname{red}w}^{\langle\gcd w\rangle}\in\operatorname{QSym}$ [1178].

Let $\operatorname{wt}:\mathfrak{A}\to\{1,2,3,\ldots\}$ be the identity map (this is well-defined since $\mathfrak{A}=\{1,2,3,\ldots\}$). Obviously, for every $N\in\{1,2,3,\ldots\}$, the set $\operatorname{wt}^{-1}(N)$ is finite.

For every word $w\in\mathfrak{A}^*$, define an element $\operatorname{Wt}(w)\in\mathbb{N}$ by $\operatorname{Wt}(w)=\operatorname{wt}(w_1)+\operatorname{wt}(w_2)+\cdots+\operatorname{wt}(w_k)$, where k is the length of w. Then,

$$\text{every } w\in\mathfrak{A}^* \text{ satisfies } \operatorname{Wt}(w)=|w| \tag{13.186.2}$$

[1179].

For every $w\in\mathfrak{L}$, the element $M_{\operatorname{red}w}^{\langle\gcd w\rangle}$ of QSym is homogeneous of degree $\operatorname{Wt}(w)$ [1180].

The $\mathbf{k}$-module QSym has a basis $(g_u)_{u\in\mathfrak{A}^*}$ having the property that for every $u\in\mathfrak{A}^*$, the element g_u of QSym is homogeneous of degree $\operatorname{Wt}(u)$ [1181].

[1178] *Proof.* Let $w\in\mathfrak{L}$. Then, Corollary 6.5.8(a) (applied to $\gcd w$ and $\operatorname{red}w$ instead of s and w) yields $M_{\operatorname{red}w}^{\langle\gcd w\rangle}\in\operatorname{QSym}$, qed.

[1179] *Proof of (13.186.2):* Let $w\in\mathfrak{A}^*$. Let k be the length of w. Then, $w=(w_1,w_2,\ldots,w_k)$, so that $|w|=w_1+w_2+\cdots+w_k$. Recall that wt is the identity map. In other words, $\operatorname{wt}=\operatorname{id}$. Now, the definition of $\operatorname{Wt}(w)$ yields

$$\begin{aligned}\operatorname{Wt}(w)&=\operatorname{wt}(w_1)+\operatorname{wt}(w_2)+\cdots+\operatorname{wt}(w_k)=\operatorname{id}(w_1)+\operatorname{id}(w_2)+\cdots+\operatorname{id}(w_k)\qquad(\text{since }\operatorname{wt}=\operatorname{id})\\&=w_1+w_2+\cdots+w_k=|w|,\end{aligned}$$

and thus (13.186.2) is proven.

[1180] *Proof.* Let $w\in\mathfrak{L}$. Then, w is a Lyndon word (since $\mathfrak{L}$ is the set of all Lyndon words), hence nonempty. Remark 6.5.11(f) (applied to $\alpha=w$) now yields $(\gcd w)|\operatorname{red}w|=|w|=\operatorname{Wt}(w)$ (by (13.186.2)). But Corollary 6.5.8(b) (applied to $\gcd w$ and $\operatorname{red}w$ instead of s and w) yields $M_{\operatorname{red}w}^{\langle\gcd w\rangle}\in\operatorname{QSym}_{(\gcd w)|\operatorname{red}w|}=\operatorname{QSym}_{\operatorname{Wt}(w)}$ (since $(\gcd w)|\operatorname{red}w|=\operatorname{Wt}(w)$). In other words, the element $M_{\operatorname{red}w}^{\langle\gcd w\rangle}$ of QSym is homogeneous of degree $\operatorname{Wt}(w)$, qed.

[1181] *Proof.* We shall show that $(M_u)_{u\in\mathfrak{A}^*}$ is such a basis.

Once (13.186.1) is proven, it thus follows that we can apply Lemma 6.3.7(c) to $A = \operatorname{QSym}$ and $b_w = M_{\operatorname{red} w}^{\langle \gcd w \rangle}$. From this, we can conclude that the family $\left(M_{\operatorname{red} w}^{\langle \gcd w \rangle}\right)_{w \in \mathfrak{L}}$ is an algebraically independent generating set of the $\mathbf{k}$-algebra QSym (provided that (13.186.1) is proven); this is precisely what we need to prove.

Hence, in order to complete the proof of Theorem 6.5.13, it is sufficient to prove (13.186.1). So we shall now prove (13.186.1).

Let U denote the $\mathbf{k}$-subalgebra of QSym generated by the family $\left(M_{\operatorname{red} w}^{\langle \gcd w \rangle}\right)_{w \in \mathfrak{L}}$. Then, U is a $\mathbf{k}$-submodule of QSym. It is clear that

$$M_\beta^{\langle s \rangle} \in U \qquad \text{for every reduced Lyndon composition } \beta \text{ and every } s \in \{1, 2, 3, \ldots\}. \tag{13.186.3}$$

[1182] Using this and using Exercise 6.5.4(d), it is now easy to see that

$$M_\beta^{\langle s \rangle} \in U \qquad \text{for every Lyndon composition } \beta \text{ and every } s \in \{1, 2, 3, \ldots\}. \tag{13.186.4}$$

[1183]

We shall now prove that

$$M_\beta \in U \qquad \text{for every composition } \beta. \tag{13.186.5}$$

Proof of (13.186.5): We will prove (13.186.5) by strong induction over $|\beta|$:

Indeed, $\mathfrak{A}^* = \operatorname{Comp}$, so that $(M_u)_{u \in \mathfrak{A}^*} = (M_u)_{u \in \operatorname{Comp}}$ is clearly a basis of the $\mathbf{k}$-module QSym. Furthermore, for every $u \in \mathfrak{A}^*$, the element M_u of QSym is homogeneous of degree $|u|$. Since $\operatorname{Wt}(u) = |u|$ for every $u \in \mathfrak{A}^*$ (by (13.186.2), applied to $w = u$), this rewrites as follows: For every $u \in \mathfrak{A}^*$, the element M_u of QSym is homogeneous of degree $\operatorname{Wt}(u)$.

Thus, $(M_u)_{u \in \mathfrak{A}^*}$ is a basis of the $\mathbf{k}$-module QSym having the property that for every $u \in \mathfrak{A}^*$, the element M_u of QSym is homogeneous of degree $\operatorname{Wt}(u)$. Hence, the $\mathbf{k}$-module QSym has a basis $(g_u)_{u \in \mathfrak{A}^*}$ having the property that for every $u \in \mathfrak{A}^*$, the element g_u of QSym is homogeneous of degree $\operatorname{Wt}(u)$ (namely, $(M_u)_{u \in \mathfrak{A}^*}$ is such a basis), qed.

[1182] *Proof of (13.186.3):* Let β be a reduced Lyndon composition. Let $s \in \{1, 2, 3, \ldots\}$.

The composition β is Lyndon and thus nonempty. Remark 6.5.11(e) (applied to $\alpha = \beta$) yields that the composition $\beta\{s\}$ is nonempty and satisfies $\operatorname{red}(\beta\{s\}) = \operatorname{red}\beta$ and $\gcd(\beta\{s\}) = s \gcd \beta$. But β is reduced; thus, $\gcd \beta = 1$ (by the definition of "reduced"). Hence, $\gcd(\beta\{s\}) = s \underbrace{\gcd \beta}_{=1} = s$. Also, Remark 6.5.11(d) (applied to $\alpha = \beta$) yields $\operatorname{red}\beta = \beta$, so that $\operatorname{red}(\beta\{s\}) = \operatorname{red}\beta = \beta$.

Remark 6.5.11(b) (applied to $\alpha = \beta\{s\}$) shows that the composition $\beta\{s\}$ is Lyndon if and only if the composition $\operatorname{red}(\beta\{s\})$ is Lyndon. Since the composition $\operatorname{red}(\beta\{s\}) = \beta$ is Lyndon, this yields that the composition $\beta\{s\}$ is Lyndon. In other words, $\beta\{s\} \in \mathfrak{L}$ (since $\mathfrak{L}$ is the set of all Lyndon words). Hence, $M_{\operatorname{red}(\beta\{s\})}^{\langle \gcd(\beta\{s\}) \rangle}$ is an element of the family $\left(M_{\operatorname{red} w}^{\langle \gcd w \rangle}\right)_{w \in \mathfrak{L}}$ (namely, the element for $w = \beta\{s\}$). In other words, $M_\beta^{\langle s \rangle}$ is an element of the family $\left(M_{\operatorname{red} w}^{\langle \gcd w \rangle}\right)_{w \in \mathfrak{L}}$ (since $\operatorname{red}(\beta\{s\}) = \beta$ and $\gcd(\beta\{s\}) = s$). Hence, $M_\beta^{\langle s \rangle}$ belongs to the $\mathbf{k}$-subalgebra of QSym generated by this family $\left(M_{\operatorname{red} w}^{\langle \gcd w \rangle}\right)_{w \in \mathfrak{L}}$. Since the $\mathbf{k}$-subalgebra of QSym generated by the family $\left(M_{\operatorname{red} w}^{\langle \gcd w \rangle}\right)_{w \in \mathfrak{L}}$ is U, this rewrites as follows: $M_\beta^{\langle s \rangle}$ belongs to U. In other words, $M_\beta^{\langle s \rangle} \in U$. This proves (13.186.3).

[1183] *Proof.* Let β be a Lyndon composition, and let $s \in \{1, 2, 3, \ldots\}$. The composition β is Lyndon and thus nonempty; hence, $\gcd \beta$ and $\operatorname{red}\beta$ are well-defined.

Remark 6.5.11(b) (applied to $\alpha = \beta$) yields that the composition β is Lyndon if and only if the composition $\operatorname{red}\beta$ is Lyndon. Since the composition β is Lyndon, we therefore conclude that the composition $\operatorname{red}\beta$ is Lyndon. Also, the composition $\operatorname{red}\beta$ is reduced (by Remark 6.5.11(c)). Thus, $\operatorname{red}\beta$ is a reduced Lyndon composition. Remark 6.5.11(a) (applied to $\alpha = \beta$) yields $\beta = (\operatorname{red}\beta)\{\gcd\beta\}$, so that $(\operatorname{red}\beta)\{\gcd\beta\} = \beta$.

Let $\alpha = \operatorname{red}\beta$. Recall that $\operatorname{red}\beta$ is a reduced Lyndon composition. In other words, α is a reduced Lyndon composition (since $\alpha = \operatorname{red}\beta$).

Exercise 6.5.4(d) (applied to $n = \gcd\beta$) yields that there exists a polynomial $P \in \mathbf{k}[z_1, z_2, z_3, \ldots]$ such that $M_{\alpha\{\gcd\beta\}}^{\langle s \rangle} = P\left(M_\alpha^{\langle 1 \rangle}, M_\alpha^{\langle 2 \rangle}, M_\alpha^{\langle 3 \rangle}, \ldots\right)$. Consider this P. We have $\underbrace{\alpha}_{=\operatorname{red}\beta}\{\gcd\beta\} = (\operatorname{red}\beta)\{\gcd\beta\} = \beta$. Hence, $M_{\alpha\{\gcd\beta\}}^{\langle s \rangle} = P\left(M_\alpha^{\langle 1 \rangle}, M_\alpha^{\langle 2 \rangle}, M_\alpha^{\langle 3 \rangle}, \ldots\right)$ rewrites as $M_\beta^{\langle s \rangle} = P\left(M_\alpha^{\langle 1 \rangle}, M_\alpha^{\langle 2 \rangle}, M_\alpha^{\langle 3 \rangle}, \ldots\right)$.

However, for every $j \in \{1, 2, 3, \ldots\}$, we have $M_\alpha^{\langle j \rangle} \in U$ (by (13.186.3), applied to α and j instead of β and s). In other words, $M_\alpha^{\langle 1 \rangle}$, $M_\alpha^{\langle 2 \rangle}$, $M_\alpha^{\langle 3 \rangle}$, $\ldots$ are elements of U. Therefore, $Q\left(M_\alpha^{\langle 1 \rangle}, M_\alpha^{\langle 2 \rangle}, M_\alpha^{\langle 3 \rangle}, \ldots\right) \in U$ for every $Q \in \mathbf{k}[z_1, z_2, z_3, \ldots]$ (since U is a $\mathbf{k}$-subalgebra of QSym). Applied to $Q = P$, this yields $P\left(M_\alpha^{\langle 1 \rangle}, M_\alpha^{\langle 2 \rangle}, M_\alpha^{\langle 3 \rangle}, \ldots\right) \in U$. Thus, $M_\beta^{\langle s \rangle} = P\left(M_\alpha^{\langle 1 \rangle}, M_\alpha^{\langle 2 \rangle}, M_\alpha^{\langle 3 \rangle}, \ldots\right) \in U$. This proves (13.186.4).

Induction step: Let $N \in \mathbb{N}$. We assume that (13.186.5) holds for all compositions β satisfying $|\beta| < N$. We need to show that (13.186.5) also holds for all compositions β satisfying $|\beta| = N$. In other words, we need to prove that $M_\beta \in U$ for every composition β satisfying $|\beta| = N$. In other words, we need to prove that

$$M_\beta \in U \qquad \text{for every } \beta \in \operatorname{Comp}_N . \tag{13.186.6}$$

Proof of (13.186.6): We will prove (13.186.6) by strong induction over β with respect to the wll-order on Comp_N. In other words, we fix some $\alpha \in \operatorname{Comp}_N$, and we assume that (13.186.6) holds for all $\beta \in \operatorname{Comp}_N$ satisfying $\beta \underset{\text{wll}}{<} \alpha$. We now need to prove that (13.186.6) holds for $\beta = \alpha$. In other words, we need to prove that $M_\alpha \in U$.

If $\alpha = \varnothing$, then $M_\alpha \in U$ is obvious[1184]. Hence, for the rest of this proof of $M_\alpha \in U$, we can WLOG assume that $\alpha \neq \varnothing$. Assume this. The composition α is nonempty (since $\alpha \neq \varnothing$), so that it satisfies $|\alpha| \neq 0$. Since $|\alpha| = N$ (because $\alpha \in \operatorname{Comp}_N$), we have $N = |\alpha| \neq 0$. Thus, N is a positive integer.

We have assumed that (13.186.6) holds for all $\beta \in \operatorname{Comp}_N$ satisfying $\beta \underset{\text{wll}}{<} \alpha$. In other words,

$$M_\beta \in U \qquad \text{for all } \beta \in \operatorname{Comp}_N \text{ satisfying } \beta \underset{\text{wll}}{<} \alpha. \tag{13.186.7}$$

Also, we have assumed that (13.186.5) holds for all compositions β satisfying $|\beta| < N$. In other words,

$$M_\beta \in U \qquad \text{for all compositions } \beta \text{ satisfying } |\beta| < N. \tag{13.186.8}$$

Let $(a_1, a_2, \ldots, a_p)$ be the CFL factorization of the word α. Then, $(a_1, a_2, \ldots, a_p)$ is a tuple of Lyndon words satisfying $\alpha = a_1 a_2 \cdots a_p$ and $a_1 \geq a_2 \geq \cdots \geq a_p$ (according to the definition of a CFL factorization). We have $p \neq 0$ (since otherwise, we would have $p = 0$ and thus $\alpha = a_1 a_2 \cdots a_p = (\text{empty product}) = \varnothing$, contradicting $\alpha \neq \varnothing$). Thus, $p \in \{1, 2, 3, \ldots\}$. Hence, the word a_1 is well-defined. Clearly, a_1 is a Lyndon word (since $(a_1, a_2, \ldots, a_p)$ is a tuple of Lyndon words).

We distinguish between two cases:

Case 1: All of the words a_1, a_2, $\ldots$, a_p are equal.

Case 2: Not all of the words a_1, a_2, $\ldots$, a_p are equal.

Let us consider Case 1 first. In this case, all of the words a_1, a_2, $\ldots$, a_p are equal. In other words, $a_1 = a_2 = \cdots = a_p$. Thus, $a_1 = a_i$ for every $i \in \{1, 2, \ldots, p\}$.

Let $x = a_1$. Then, $x = a_1 = a_i$ for every $i \in \{1, 2, \ldots, p\}$. Multiplying these identities for all $i \in \{1, 2, \ldots, p\}$, we obtain $\underbrace{xx \cdots x}_{p \text{ times}} = a_1 a_2 \cdots a_p = \alpha$, so that $\alpha = \underbrace{xx \cdots x}_{p \text{ times}} = x^p$, thus $x^p = \alpha$. Also, $x = a_1$ is a Lyndon word. Let $k = |x|$. Then, $x \in \operatorname{Comp}_k$. Also, $N = \left| \underbrace{\alpha}_{= x^p} \right| = |x^p| = p\,|x|$, so that $p\,|x| = N$. Thus, $p \underbrace{k}_{= |x|} = p\,|x| = N$.

Now, Corollary 6.5.29 (applied to $s = p$) yields

$$M_x^{\langle p \rangle} - M_{x^p} \in \sum_{\substack{w \in \operatorname{Comp}_{pk};\\ w \underset{\text{wll}}{<} x^p}} \mathbf{k} M_w = \sum_{\substack{w \in \operatorname{Comp}_N;\\ w \underset{\text{wll}}{<} \alpha}} \mathbf{k} \underbrace{M_w}_{\substack{\in U\\ \text{(by (13.186.7), applied}\\ \text{to } \beta = w)}} \qquad (\text{since } pk = N \text{ and } x^p = \alpha)$$

$$\subset \sum_{\substack{w \in \operatorname{Comp}_N;\\ w \underset{\text{wll}}{<} \alpha}} \mathbf{k} U \subset U \qquad (\text{since } U \text{ is a } \mathbf{k}\text{-submodule of } \operatorname{QSym}) .$$

Hence,

$$M_{x^p} - M_x^{\langle p \rangle} = - \underbrace{\left(M_x^{\langle p \rangle} - M_{x^p} \right)}_{\in U} \in -U \subset U \qquad (\text{since } U \text{ is a } \mathbf{k}\text{-submodule of } \operatorname{QSym}) ,$$

[1184] *Proof.* Assume that $\alpha = \varnothing$. Then, $M_\alpha = M_\varnothing = 1 \in U$ (since U is a $\mathbf{k}$-subalgebra of QSym), qed.

so that

$$M_{x^p} \in \underbrace{M_x^{\langle p \rangle}}_{\substack{\in U \\ \text{(by (13.186.4), applied} \\ \text{to } x \text{ and } p \text{ instead of } \beta \text{ and } s)}} + U \in U + U \subset U$$

(since U is a $\mathbf{k}$-submodule of QSym). Since $x^p = \alpha$, this rewrites as $M_\alpha \in U$. Thus, we have proven $M_\alpha \in U$ in Case 1.

Let us now consider Case 2. In this case, not all of the words a_1, a_2, ..., a_p are equal. Hence, there exists some $k \in \{1, 2, \ldots, p-1\}$ such that $a_k \neq a_{k+1}$. Consider this k.

We have $a_k \geq a_{k+1}$ (since $a_1 \geq a_2 \geq \cdots \geq a_p$). Combined with $a_k \neq a_{k+1}$, this yields $a_k > a_{k+1}$. Let x be the word $a_1 a_2 \cdots a_k$, and let y be the word $a_{k+1} a_{k+2} \cdots a_p$. Then, Corollary 6.5.25 (applied to $u = \alpha$ and $n = N$) yields

$$M_\alpha = M_x M_y - \left(\text{a sum of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_N \text{ satisfying } w \underset{\text{wll}}{<} \alpha \right).$$

Thus,

$$\begin{aligned} M_x M_y - M_\alpha &= \left(\text{a sum of terms of the form } M_w \text{ with } w \in \operatorname{Comp}_N \text{ satisfying } w \underset{\text{wll}}{<} \alpha \right) \\ &\in \sum_{\substack{w \in \operatorname{Comp}_N; \\ w \underset{\text{wll}}{<} \alpha}} \mathbf{k} \underbrace{M_w}_{\substack{\in U \\ \text{(by (13.186.7), applied} \\ \text{to } \beta = w)}} \subset \sum_{\substack{w \in \operatorname{Comp}_N; \\ w \underset{\text{wll}}{<} \alpha}} \mathbf{k} U \subset U \end{aligned}$$

(since U is a $\mathbf{k}$-submodule of QSym). Hence,

$$M_\alpha \in M_x M_y - U. \tag{13.186.9}$$

Now, it is easy to see that $N = |x| + |y|$ [1185]. But $|x| > 0$ [1186] and $|y| > 0$ [1187]. Hence, $N = |x| + \underbrace{|y|}_{>0} > |x|$, which yields $|x| < N$. Hence, (13.186.8) (applied to $\beta = x$) yields $M_x \in U$. Also, $N = \underbrace{|x|}_{>0} + |y| > |y|$, and thus $|y| < N$, so that (13.186.8) (applied to $\beta = y$) yields $M_y \in U$. Now, (13.186.9) becomes $M_\alpha \in \underbrace{M_x}_{\in U} \underbrace{M_y}_{\in U} - U \subset UU - U \subset U$ (since U is a $\mathbf{k}$-subalgebra of QSym). Thus, we have proven $M_\alpha \in U$ in Case 2.

Now, we have proven $M_\alpha \in U$ in each of the two Cases 1 and 2. Since these two Cases cover all possibilities, this yields that we always have $M_\alpha \in U$. In other words, (13.186.6) holds for $\beta = \alpha$.

Thus, we have completed the induction step of our induction over β. Therefore, we have proven (13.186.6) by induction. So we now know that $M_\beta \in U$ for every $\beta \in \operatorname{Comp}_N$. In other words, $M_\beta \in U$ for every composition β satisfying $|\beta| = N$. In other words, (13.186.5) holds for all compositions β satisfying $|\beta| = N$.

Thus, we have completed the induction step of our induction over N. Hence, (13.186.5) is proven by induction over N.

[1185] *Proof.* Multiplying the equalities $x = a_1 a_2 \cdots a_k$ and $y = a_{k+1} a_{k+2} \cdots a_p$, we obtain

$$xy = (a_1 a_2 \cdots a_k)(a_{k+1} a_{k+2} \cdots a_p) = a_1 a_2 \cdots a_p = \alpha,$$

so that $\alpha = xy$ and thus $|\alpha| = |xy| = |x| + |y|$, so that $|x| + |y| = |\alpha| = N$, qed.

[1186] *Proof.* Notice that a_k is a Lyndon word (since $(a_1, a_2, \ldots, a_p)$ is a tuple of Lyndon words), and thus nonempty.

But a_k is a suffix of the word $a_1 a_2 \cdots a_k$. Hence, $\ell(a_k) \leq \ell(a_1 a_2 \cdots a_k)$, so that $\ell(a_1 a_2 \cdots a_k) \geq \ell(a_k) > 0$ (since the word a_k is nonempty). Now, $\ell\left(\underbrace{x}_{= a_1 a_2 \cdots a_k}\right) = \ell(a_1 a_2 \cdots a_k) > 0$, so that the word x is nonempty, and therefore $|x| > 0$, qed.

[1187] *Proof.* Notice that a_{k+1} is a Lyndon word (since $(a_1, a_2, \ldots, a_p)$ is a tuple of Lyndon words), and thus nonempty.

But a_{k+1} is a prefix of the word $a_{k+1} a_{k+2} \cdots a_p$. Hence, $\ell(a_{k+1}) \leq \ell(a_{k+1} a_{k+2} \cdots a_p)$, so that $\ell(a_{k+1} a_{k+2} \cdots a_p) \geq \ell(a_{k+1}) > 0$ (since the word a_{k+1} is nonempty). Now, $\ell\left(\underbrace{y}_{= a_{k+1} a_{k+2} \cdots a_p}\right) = \ell(a_{k+1} a_{k+2} \cdots a_p) > 0$, so that the word y is nonempty, and therefore $|y| > 0$, qed.

Now, recall that the family $(M_\beta)_{\beta\in\mathrm{Comp}}$ is a basis of the $\mathbf{k}$-module QSym, and thus generates this $\mathbf{k}$-module. Hence,

$$\mathrm{QSym} = \sum_{\beta\in\mathrm{Comp}} \mathbf{k} \underbrace{M_\beta}_{\substack{\in U \\ (\text{by } (13.186.5))}} \subset \sum_{\beta\in\mathrm{Comp}} \mathbf{k}U \subset U$$

(since U is a $\mathbf{k}$-submodule of QSym). Combined with $U \subset \mathrm{QSym}$, this yields $U = \mathrm{QSym}$. Since U is the $\mathbf{k}$-subalgebra of QSym generated by the family $\left(M_{\operatorname{red} w}^{\langle \gcd w\rangle}\right)_{w\in\mathfrak{L}}$, this shows that the $\mathbf{k}$-subalgebra of QSym generated by the family $\left(M_{\operatorname{red} w}^{\langle \gcd w\rangle}\right)_{w\in\mathfrak{L}}$ is QSym itself. In other words, the family $\left(M_{\operatorname{red} w}^{\langle \gcd w\rangle}\right)_{w\in\mathfrak{L}}$ generates the $\mathbf{k}$-algebra QSym. Thus, (13.186.1) is proven. As we know, this completes the proof of Theorem 6.5.13. □

13.187. **Solution to Exercise 6.5.32.** *Solution to Exercise 6.5.32.*

Proof of Theorem 6.4.3. We know (from the proof of Theorem 6.5.13) that the family $\left(M_{\operatorname{red} w}^{\langle \gcd w\rangle}\right)_{w\in\mathfrak{L}}$ is an algebraically independent generating set of the $\mathbf{k}$-algebra QSym.

Now, define a grading on the $\mathbf{k}$-algebra $\mathbf{k}[x_w \mid w\in\mathfrak{L}]$ by setting $\deg(x_w) = \sum_{i=1}^{\ell(w)} w_i$ for every $w\in\mathfrak{L}$. By the universal property of the polynomial algebra $\mathbf{k}[x_w \mid w\in\mathfrak{L}]$, we can define a $\mathbf{k}$-algebra homomorphism $\Phi : \mathbf{k}[x_w \mid w\in\mathfrak{L}] \to \mathrm{QSym}$ by setting

$$\Phi(x_w) = M_{\operatorname{red} w}^{\langle \gcd w\rangle} \qquad \text{for every } w\in\mathfrak{L}.$$

[1188] This homomorphism Φ is a $\mathbf{k}$-algebra isomorphism (since $\left(M_{\operatorname{red} w}^{\langle \gcd w\rangle}\right)_{w\in\mathfrak{L}}$ is an algebraically independent generating set of the $\mathbf{k}$-algebra QSym) and is graded (because for every $w\in\mathfrak{L}$, the element $M_{\operatorname{red} w}^{\langle \gcd w\rangle}$ of QSym is homogeneous of degree $\deg(x_w)$ [1189]). Thus, Φ is an isomorphism of graded $\mathbf{k}$-algebras. Hence, $\mathrm{QSym} \cong \mathbf{k}[x_w \mid w\in\mathfrak{L}]$ as graded $\mathbf{k}$-algebras. Thus, QSym is a polynomial algebra. This proves Theorem 6.4.3. □

13.188. **Solution to Exercise 6.5.34.** *Solution to Exercise 6.5.34.*

Proof of Corollary 6.5.33. Theorem 6.5.13 yields that the family $\left(M_w^{\langle s\rangle}\right)_{(w,s)\in\mathfrak{RL}\times\{1,2,3,\ldots\}}$ is an algebraically independent generating set of the $\mathbf{k}$-algebra QSym.

Notice that (1) is a reduced Lyndon composition; that is, $(1)\in\mathfrak{RL}$ (since $\mathfrak{RL}$ is the set of all reduced Lyndon compositions). Hence, $\{(1)\}\subset\mathfrak{RL}$, whence $\{(1)\}\times\{1,2,3,\ldots\}\subset\mathfrak{RL}\times\{1,2,3,\ldots\}$.

The following fact is straightforward to check: If A is a commutative $\mathbf{k}$-algebra, and if $(a_i)_{i\in I}$ is an algebraically independent generating set of the $\mathbf{k}$-algebra A, and if J is a subset of I, then $(a_i)_{i\in I\setminus J}$ is an algebraically independent generating set of the $\mathbf{k}[a_i \mid i\in J]$-algebra A. [1190] We can apply this fact to $A = \mathrm{QSym}$, $I = \mathfrak{RL}\times\{1,2,3,\ldots\}$, $(a_i)_{i\in I} = \left(M_w^{\langle s\rangle}\right)_{(w,s)\in\mathfrak{RL}\times\{1,2,3,\ldots\}}$ and $J = \{(1)\}\times\{1,2,3,\ldots\}$. As a result, we conclude that $\left(M_w^{\langle s\rangle}\right)_{(w,s)\in(\mathfrak{RL}\times\{1,2,3,\ldots\})\setminus(\{(1)\}\times\{1,2,3,\ldots\})}$ is an algebraically independent generating set of

[1188] This is well-defined since $M_{\operatorname{red} w}^{\langle \gcd w\rangle}\in\mathrm{QSym}$ (by Corollary 6.5.8(a), applied to $\alpha = \operatorname{red} w$ and $s = \gcd w$).

[1189] *Proof.* Let $w\in\mathfrak{L}$. Then, w is a Lyndon word (since $\mathfrak{L}$ is the set of all Lyndon words), and thus nonempty. Hence, Remark 6.5.11(f) (applied to $\alpha = w$) yields $(\gcd w)\left|\operatorname{red} w\right| = |w| = \sum_{i=1}^{\ell(w)} w_i = \deg(x_w)$. Now, Corollary 6.5.8(b) (applied to $\alpha = \operatorname{red} w$ and $s = \gcd w$) yields $M_{\operatorname{red} w}^{\langle \gcd w\rangle}\in\mathrm{QSym}_{(\gcd w)\left|\operatorname{red} w\right|} = \mathrm{QSym}_{\deg(x_w)}$ (since $(\gcd w)\left|\operatorname{red} w\right| = \deg(x_w)$). In other words, the element $M_{\operatorname{red} w}^{\langle \gcd w\rangle}$ of QSym is homogeneous of degree $\deg(x_w)$, qed.

[1190] The idea behind this fact is that a polynomial ring in the indeterminates $(x_i)_{i\in I}$ can be regarded as a polynomial ring in the indeterminates $(x_i)_{i\in I\setminus J}$ over the polynomial ring in the indeterminates $(x_i)_{i\in J}$.

the $\mathbf{k}\left[M_w^{\langle s\rangle} \mid (w,s)\in\{(1)\}\times\{1,2,3,\ldots\}\right]$-algebra QSym. Hence, the $\mathbf{k}\left[M_w^{\langle s\rangle} \mid (w,s)\in\{(1)\}\times\{1,2,3,\ldots\}\right]$-algebra QSym has an algebraically independent generating set; it is therefore a polynomial algebra over $\mathbf{k}\left[M_w^{\langle s\rangle} \mid (w,s)\in\{(1)\}\times\{1,2,3,\ldots\}\right]$. Since $\mathbf{k}\left[M_w^{\langle s\rangle} \mid (w,s)\in\{(1)\}\times\{1,2,3,\ldots\}\right] = \Lambda$ [1191], this rewrites as follows: The Λ-algebra QSym is a polynomial algebra over Λ. This proves Corollary 6.5.33. □

13.189. **Solution to Exercise 6.6.8.** *Solution to Exercise 6.6.8.* Before we step to the proofs of Proposition 6.6.5, Lemma 6.6.6 and Proposition 6.6.7, let us state a basic fact about cycles of permutations:

Lemma 13.189.1. *Let $n\in\mathbb{N}$. Let $\tau\in\mathfrak{S}_n$ be a permutation. Let z be a cycle of τ. Let k be the size of z. Let $p\in z$. For each $u\in\mathbb{N}$, we set*

$$p_u := \tau^u(p).$$

Then:

(a) *We have $z=\{p_0,p_1,p_2,\ldots\}$.*
(b) *We have $\tau^k(p)=p$.*
(c) *We have $z=\{p_0,p_1,\ldots,p_{k-1}\}$.*
(d) *We have $\tau^i(p_u)=p_{u+i}$ for each $u\in\mathbb{N}$ and $i\in\mathbb{N}$.*
(e) *We have $p_{u+k}=p_u$ for each $u\in\mathbb{N}$.*
(f) *We have $p_u\in z$ for each $u\in\mathbb{N}$.*
(g) *The k elements $p_0,p_1,\ldots,p_{k-1}$ are distinct.*
(h) *We have $z=\{p_u,p_{u+1},\ldots,p_{u+k-1}\}$ for each $u\in\mathbb{N}$.*
(i) *We have $\operatorname{ord}_\tau(p)=k$.*

Proof of Lemma 13.189.1. All of these are well-known properties of cycles in permutations. □

We record a simple corollary of Lemma 13.189.1:

Lemma 13.189.2. *Let $n\in\mathbb{N}$. Let $\tau\in\mathfrak{S}_n$ be a permutation. Let $p\in\{1,2,\ldots,n\}$. Let $j=\operatorname{ord}_\tau(p)$. Then:*

(a) *We have $\tau^j(p)=p$.*
(b) *We have $j=\operatorname{ord}_\tau(\tau(p))$.*

Proof of Lemma 13.189.2. Let z be the cycle of τ that contains p. Thus, $p\in z$. Let k be the size of z. For each $u\in\mathbb{N}$, we set $p_u:=\tau^u(p)$.

Lemma 13.189.1(i) yields $\operatorname{ord}_\tau(p)=k$. Hence, $j=\operatorname{ord}_\tau(p)=k$. But Lemma 13.189.1(b) yields $\tau^k(p)=p$. But from $j=k$, we obtain $\tau^j(p)=\tau^k(p)=p$. This proves Lemma 13.189.2(a).

(b) Lemma 13.189.1(f) (applied to $u=1$) yields $p_1\in z$. But the definition of p_1 yields $p_1=\underbrace{\tau^1}_{=\tau}(p)=\tau(p)$. Hence, $\tau(p)=p_1\in z$.

Set $q=\tau(p)$. Thus, $q=\tau(p)\in z$. For each $u\in\mathbb{N}$, we set $q_u:=\tau^u(q)$. Then, Lemma 13.189.1(i) (applied to q and q_u instead of p and p_u) yields $\operatorname{ord}_\tau(q)=k$. Comparing this with $j=k$, we obtain $j=\operatorname{ord}_\tau\left(\underbrace{q}_{=\tau(p)}\right)=\operatorname{ord}_\tau(\tau(p))$. This proves Lemma 13.189.2(b). □

[1191] *Proof.* The first sentence of Proposition 2.4.1 yields that the family $(e_1,e_2,e_3,\ldots)$ generates the $\mathbf{k}$-algebra Λ. In other words, $\Lambda=\mathbf{k}[e_1,e_2,e_3,\ldots]=\mathbf{k}[e_s \mid s\in\{1,2,3,\ldots\}]$.

But

$$\begin{aligned}
&\mathbf{k}\left[M_w^{\langle s\rangle} \mid (w,s)\in\{(1)\}\times\{1,2,3,\ldots\}\right]\\
&=\mathbf{k}\left[\underbrace{M_{(1)}^{\langle s\rangle}}_{\substack{=e_s\\ \text{(by Exercise 6.5.5)}}} \mid s\in\{1,2,3,\ldots\}\right] \qquad \left(\begin{array}{c}\text{since the elements of } \{(1)\}\times\{1,2,3,\ldots\} \text{ are precisely}\\ \text{the pairs of the form } ((1),s) \text{ for } s\in\{1,2,3,\ldots\}\end{array}\right)\\
&=\mathbf{k}[e_s \mid s\in\{1,2,3,\ldots\}]=\Lambda
\end{aligned}$$

(since $\Lambda=\mathbf{k}[e_s \mid s\in\{1,2,3,\ldots\}]$), qed.

Proof of Proposition 6.6.5. Let $k = \operatorname{ord}_\tau(h)$. Thus, k is the smallest positive integer i such that $\tau^i(h) = h$ (by the definition of $\operatorname{ord}_\tau(h)$). Hence, k is a positive integer, and we have $\tau^k(h) = h$. Furthermore, $\tau^{k+1}(h) = \underbrace{\tau}_{=\tau^1}\left(\underbrace{\tau^k(h)}_{=h}\right) = \tau^1(h)$, so that $\tau^1(h) = \tau^{k+1}(h)$.

The definition of $w_{\tau,h}$ yields

$$\begin{aligned} w_{\tau,h} &= w_{\tau^1(h)} w_{\tau^2(h)} \cdots w_{\tau^k(h)} \qquad (\text{since } k = \operatorname{ord}_\tau(h)) \\ &= \left(w_{\tau^1(h)}, w_{\tau^2(h)}, \ldots, w_{\tau^k(h)}\right). \end{aligned} \tag{13.189.1}$$

Hence, the word $w_{\tau,h}$ has length k. In other words, the word $w_{\tau,h}$ has length $\operatorname{ord}_\tau(h)$ (since $k = \operatorname{ord}_\tau(h)$). Moreover, the word $w_{\tau,h}$ is nonempty (since it has length k, but k is a positive integer). This proves Proposition 6.6.5(a).

(b) The first letter of the word $w_{\tau,h}$ exists (since the word $w_{\tau,h}$ is nonempty). This first letter is $w_{\tau^1(h)}$ (since $w_{\tau,h} = \left(w_{\tau^1(h)}, w_{\tau^2(h)}, \ldots, w_{\tau^k(h)}\right)$). In other words, this first letter is $w_{\tau(h)}$ (since $\tau^1 = \tau$). This proves Proposition 6.6.5(b).

(c) The last letter of the word $w_{\tau,h}$ exists (since the word $w_{\tau,h}$ is nonempty). This last letter is $w_{\tau^k(h)}$ (since $w_{\tau,h} = \left(w_{\tau^1(h)}, w_{\tau^2(h)}, \ldots, w_{\tau^k(h)}\right)$). In other words, this last letter is w_h (since $\tau^k(h) = h$). This proves Proposition 6.6.5(c).

(d) From (13.189.1), we obtain

$$\begin{aligned} c \cdot w_{\tau,h} &= c \cdot \left(w_{\tau^1(h)}, w_{\tau^2(h)}, \ldots, w_{\tau^k(h)}\right) = \left(w_{\tau^2(h)}, w_{\tau^3(h)}, \ldots, w_{\tau^k(h)}, w_{\tau^1(h)}\right) \\ &\qquad \left(\text{by the definition of the action of } C \text{ on } \mathfrak{A}^k\right) \\ &= \left(w_{\tau^2(h)}, w_{\tau^3(h)}, \ldots, w_{\tau^k(h)}, w_{\tau^{k+1}(h)}\right) \qquad \left(\text{since } \tau^1(h) = \tau^{k+1}(h)\right) \\ &= \left(w_{\tau^2(h)}, w_{\tau^3(h)}, \ldots, w_{\tau^{k+1}(h)}\right). \end{aligned} \tag{13.189.2}$$

On the other hand, we have $k = \operatorname{ord}_\tau(h)$ and therefore $k = \operatorname{ord}_\tau(\tau(h))$ (by Lemma 13.189.2(b), applied to $j = k$ and $p = h$). Hence, the definition of $w_{\tau,\tau(h)}$ yields

$$\begin{aligned} w_{\tau,\tau(h)} &= w_{\tau^1(\tau(h))} w_{\tau^2(\tau(h))} \cdots w_{\tau^k(\tau(h))} = \left(w_{\tau^1(\tau(h))}, w_{\tau^2(\tau(h))}, \ldots, w_{\tau^k(\tau(h))}\right) \\ &\qquad \left(\text{since } w_{\tau^1(\tau(h))}, w_{\tau^2(\tau(h))}, \ldots, w_{\tau^k(\tau(h))} \text{ are single letters}\right) \\ &= \left(w_{\tau^2(h)}, w_{\tau^3(h)}, \ldots, w_{\tau^{k+1}(h)}\right) \\ &\qquad \left(\begin{array}{c} \text{since each } i \in \{1, 2, \ldots, k\} \text{ satisfies } w_{\tau^i(\tau(h))} = w_{\tau^{i+1}(h)} \\ \left(\text{because } \tau^i(\tau(h)) = \tau^{i+1}(h)\right) \end{array}\right). \end{aligned}$$

Comparing this with (13.189.2), we obtain $w_{\tau,\tau(h)} = c \cdot w_{\tau,h}$. This proves Proposition 6.6.5(d).

(e) Let us first show that

$$w_{\tau,\tau^i(h)} = c^i \cdot w_{\tau,h} \qquad \text{for each } i \in \mathbb{N}. \tag{13.189.3}$$

[*Proof of (13.189.3):* We shall prove (13.189.3) by induction on i:

Induction base: We have $w_{\tau,\tau^0(h)} = w_{\tau,h}$ (since $\underbrace{\tau^0}_{=\operatorname{id}}(h) = h$). Comparing this with $\underbrace{c^0}_{=\operatorname{id}} \cdot w_{\tau,h} = w_{\tau,h}$, we obtain $w_{\tau,\tau^0(h)} = c^0 \cdot w_{\tau,h}$. In other words, (13.189.3) holds for $i = 0$. This completes the induction base.

Induction step: Let $j \in \mathbb{N}$. Assume that (13.189.3) holds for $i = j$. We must prove that (13.189.3) holds for $i = j + 1$.

We have assumed that (13.189.3) holds for $i = j$. In other words, we have $w_{\tau,\tau^j(h)} = c^j \cdot w_{\tau,h}$. Now,

$$\begin{aligned} w_{\tau,\tau^{j+1}(h)} &= w_{\tau,\tau(\tau^j(h))} \qquad \left(\text{since } \tau^{j+1}(h) = \tau\left(\tau^j(h)\right)\right) \\ &= c \cdot \underbrace{w_{\tau,\tau^j(h)}}_{=c^j \cdot w_{\tau,h}} \qquad \left(\text{by Proposition 6.6.5(d), applied to } \tau^j(h) \text{ instead of } h\right) \\ &= \underbrace{c \cdot c^j}_{=c^{j+1}} \cdot w_{\tau,h} = c^{j+1} \cdot w_{\tau,h}. \end{aligned}$$

In other words, (13.189.3) holds for $i = j + 1$. This completes the induction step. Thus, (13.189.3) is proved by induction.]

Now, forget that we fixed h. We thus have proved (13.189.3) for each $h \in \{1, 2, \ldots, n\}$.

Now, let $h \in \{1, 2, \ldots, n\}$. We want to prove Proposition 6.6.5(e); in other words, we must prove that $w_{\tau,\tau^i(h)} = c^i \cdot w_{\tau,h}$ for each $i \in \mathbb{Z}$. So let us fix $i \in \mathbb{Z}$. We must then prove that $w_{\tau,\tau^i(h)} = c^i \cdot w_{\tau,h}$. If $i \in \mathbb{N}$, then this follows immediately from (13.189.3). Thus, we WLOG assume that $i \notin \mathbb{N}$. Hence, i is a negative integer (since $i \in \mathbb{Z}$ but $i \notin \mathbb{N}$), so that $-i \in \{1, 2, 3, \ldots\} \subset \mathbb{N}$. Thus, we can apply (13.189.3) to $\tau^i(h)$ and $-i$ instead of h and i (since we have proved (13.189.3) for every value of h, not just for the h that we are currently considering). We thus obtain

$$w_{\tau,\tau^{-i}(\tau^i(h))} = c^{-i} \cdot w_{\tau,\tau^i(h)}.$$

In view of $\tau^{-i}\left(\tau^i(h)\right) = \underbrace{\left(\tau^{-i} \circ \tau^i\right)}_{=\mathrm{id}}(h) = h$, this rewrites as

$$w_{\tau,h} = c^{-i} \cdot w_{\tau,\tau^i(h)}.$$

Hence,

$$c^i \cdot \underbrace{w_{\tau,h}}_{=c^{-i}\cdot w_{\tau,\tau^i(h)}} = \underbrace{c^i \cdot c^{-i}}_{=\mathrm{id}} \cdot w_{\tau,\tau^i(h)} = w_{\tau,\tau^i(h)}.$$

In other words, $w_{\tau,\tau^i(h)} = c^i \cdot w_{\tau,h}$. This proves Proposition 6.6.5(e). □

Proof of Lemma 6.6.6. Definition 5.3.3 says that $\operatorname{std} w$ is the unique permutation $\sigma \in \mathfrak{S}_n$ defined in Proposition 5.3.2. In other words, $\operatorname{std} w$ is the unique permutation $\sigma \in \mathfrak{S}_n$ such that for every two elements a and b of $\{1, 2, \ldots, n\}$ satisfying $a < b$, we have ($\sigma(a) < \sigma(b)$ if and only if $w_a \le w_b$). Hence, $\operatorname{std} w$ is such a permutation σ. In other words, $\operatorname{std} w$ is a permutation in $\mathfrak{S}_n$ and has the property that for every two elements a and b of $\{1, 2, \ldots, n\}$ satisfying $a < b$, we have

$$\left((\operatorname{std} w)(a) < (\operatorname{std} w)(b) \text{ if and only if } w_a \le w_b\right). \qquad (13.189.4)$$

But $\tau = (\operatorname{std} w)^{-1}$, so that $\tau^{-1} = \operatorname{std} w$. Note that τ is a permutation (since $\tau \in \mathfrak{S}_n$). Hence, τ is a bijective map. Thus, in particular, τ is an injective map.

(a) Assume that $\tau^{-1}(\alpha) < \tau^{-1}(\beta)$. In view of $\tau^{-1} = \operatorname{std} w$, this rewrites as $(\operatorname{std} w)(\alpha) < (\operatorname{std} w)(\beta)$. But (13.189.4) (applied to $a = \alpha$ and $b = \beta$) shows that we have

$$\left((\operatorname{std} w)(\alpha) < (\operatorname{std} w)(\beta) \text{ if and only if } w_\alpha \le w_\beta\right).$$

Hence, we have $w_\alpha \le w_\beta$ (since we have $(\operatorname{std} w)(\alpha) < (\operatorname{std} w)(\beta)$). This proves Lemma 6.6.6(a).

(b) Assume that $\tau^{-1}(\alpha) \ge \tau^{-1}(\beta)$. In view of $\tau^{-1} = \operatorname{std} w$, this rewrites as $(\operatorname{std} w)(\alpha) \ge (\operatorname{std} w)(\beta)$. Hence, $(\operatorname{std} w)(\alpha) < (\operatorname{std} w)(\beta)$ does not hold. But (13.189.4) (applied to $a = \alpha$ and $b = \beta$) shows that we have

$$\left((\operatorname{std} w)(\alpha) < (\operatorname{std} w)(\beta) \text{ if and only if } w_\alpha \le w_\beta\right).$$

Hence, $w_\alpha \le w_\beta$ does not hold (since $(\operatorname{std} w)(\alpha) < (\operatorname{std} w)(\beta)$ does not hold). In other words, we have $w_\alpha > w_\beta$. This proves Lemma 6.6.6(b).

(d) Assume that $\tau(\alpha) \ge \tau(\beta)$. But $\alpha \ne \beta$ (since $\alpha < \beta$) and thus $\tau(\alpha) \ne \tau(\beta)$ (since τ is injective). Combining this with $\tau(\alpha) \ge \tau(\beta)$, we obtain $\tau(\alpha) > \tau(\beta)$. In other words, $\tau(\beta) < \tau(\alpha)$. Also, $\beta \ge \alpha$ (since $\alpha < \beta$), so that $\tau^{-1}(\tau(\beta)) = \beta \ge \alpha = \tau^{-1}(\tau(\alpha))$. Hence, Lemma 6.6.6(b) (applied to $\tau(\beta)$ and $\tau(\alpha)$ instead of α and β) yields $w_{\tau(\beta)} > w_{\tau(\alpha)}$. In other words, $w_{\tau(\alpha)} < w_{\tau(\beta)}$. This proves Lemma 6.6.6(d).

(c) We are in one of the following two cases:

Case 1: We have $\tau(\alpha) < \tau(\beta)$.

Case 2: We have $\tau(\alpha) \ge \tau(\beta)$.

Let us first consider Case 1. In this case, we have $\tau(\alpha) < \tau(\beta)$. Also, $\tau^{-1}(\tau(\alpha)) = \alpha < \beta = \tau^{-1}(\tau(\beta))$. Hence, Lemma 6.6.6(a) (applied to $\tau(\alpha)$ and $\tau(\beta)$ instead of α and β) yields $w_{\tau(\alpha)} \le w_{\tau(\beta)}$. Thus, Lemma 6.6.6(c) is proven in Case 1.

Let us next consider Case 2. In this case, we have $\tau(\alpha) \ge \tau(\beta)$. Hence, Lemma 6.6.6(d) yields $w_{\tau(\alpha)} < w_{\tau(\beta)}$. Hence, $w_{\tau(\alpha)} \le w_{\tau(\beta)}$. Thus, Lemma 6.6.6(c) is proven in Case 2.

We have thus proved Lemma 6.6.6(c) in each of the two Cases 1 and 2. Hence, Lemma 6.6.6(c) always holds.

(e) Assume that $w_{\tau(\alpha)} = w_{\tau(\beta)}$. We must prove that $\tau(\alpha) < \tau(\beta)$.

Assume the contrary. Thus, $\tau(\alpha) \geq \tau(\beta)$. Hence, Lemma 6.6.6(d) yields $w_{\tau(\alpha)} < w_{\tau(\beta)}$. This contradicts $w_{\tau(\alpha)} = w_{\tau(\beta)}$. This contradiction shows that our assumption was false. Hence, Lemma 6.6.6(e) is proven.

(f) Assume that $w_{\tau,\alpha} = w_{\tau,\beta}$.

Now, Proposition 6.6.5(b) (applied to $h = \alpha$) yields that the first letter of the word $w_{\tau,\alpha}$ is $w_{\tau(\alpha)}$. Likewise, the first letter of the word $w_{\tau,\beta}$ is $w_{\tau(\beta)}$. Hence, the first letters of the two words $w_{\tau,\alpha}$ and $w_{\tau,\beta}$ are $w_{\tau(\alpha)}$ and $w_{\tau(\beta)}$. Thus, from $w_{\tau,\alpha} = w_{\tau,\beta}$, we obtain $w_{\tau(\alpha)} = w_{\tau(\beta)}$. Hence, Lemma 6.6.6(e) yields $\tau(\alpha) < \tau(\beta)$. It remains to show that $w_{\tau,\tau(\alpha)} = w_{\tau,\tau(\beta)}$.

Proposition 6.6.5(d) (applied to $h = \alpha$) yields $w_{\tau,\tau(\alpha)} = c \cdot w_{\tau,\alpha}$. Proposition 6.6.5(d) (applied to $h = \beta$) yields $w_{\tau,\tau(\beta)} = c \cdot w_{\tau,\beta}$. Thus,

$$w_{\tau,\tau(\alpha)} = c \cdot \underbrace{w_{\tau,\alpha}}_{=w_{\tau,\beta}} = c \cdot w_{\tau,\beta} = w_{\tau,\tau(\beta)}.$$

Thus, the proof of Lemma 6.6.6(f) is complete (since we already have shown that $\tau(\alpha) < \tau(\beta)$).

(g) Assume that $w_{\tau,\alpha} = w_{\tau,\beta}$. We must show that

$$\tau^i(\alpha) < \tau^i(\beta) \qquad \text{for each } i \in \mathbb{N}. \tag{13.189.5}$$

[*Proof of (13.189.5):* We shall prove (13.189.5) by induction on i:

Induction base: We have $\alpha < \beta$. In view of $\underbrace{\tau^0}_{=\mathrm{id}}(\alpha) = \alpha$ and $\underbrace{\tau^0}_{=\mathrm{id}}(\beta) = \beta$, this rewrites as $\tau^0(\alpha) < \tau^0(\beta)$. In other words, (13.189.5) holds for $i = 0$. This completes the induction base.

Induction step: Let $j \in \mathbb{N}$. Assume that (13.189.5) holds for $i = j$. We must prove that (13.189.5) holds for $i = j + 1$.

We have assumed that (13.189.5) holds for $i = j$. In other words, we have $\tau^j(\alpha) < \tau^j(\beta)$.

Proposition 6.6.5(e) (applied to $i = j$ and $h = \alpha$) yields $w_{\tau,\tau^j(\alpha)} = c^j \cdot w_{\tau,\alpha}$. The same argument (applied to β instead of α) yields $w_{\tau,\tau^j(\beta)} = c^j \cdot w_{\tau,\beta}$. Thus,

$$w_{\tau,\tau^j(\alpha)} = c^j \cdot \underbrace{w_{\tau,\alpha}}_{=w_{\tau,\beta}} = c^j \cdot w_{\tau,\beta} = w_{\tau,\tau^j(\beta)}.$$

Hence, Lemma 6.6.6(f) (applied to $\tau^j(\alpha)$ and $\tau^j(\beta)$ instead of α and β) yields $\tau\left(\tau^j(\alpha)\right) < \tau\left(\tau^j(\beta)\right)$ and $w_{\tau,\tau(\tau^j(\alpha))} = w_{\tau,\tau(\tau^j(\beta))}$. Now,

$$\underbrace{\tau^{j+1}}_{=\tau\circ\tau^j}(\alpha) = \left(\tau \circ \tau^j\right)(\alpha) = \tau\left(\tau^j(\alpha)\right) < \tau\left(\tau^j(\beta)\right) = \underbrace{\left(\tau \circ \tau^j\right)}_{=\tau^{j+1}}(\beta) = \tau^{j+1}(\beta).$$

In other words, (13.189.5) holds for $i = j + 1$. This completes the induction step. Thus, (13.189.5) is proved by induction.]

Hence, Lemma 6.6.6(g) is proved.

(h) We have assumed that

$$\text{every } i \in \{0, 1, \ldots, j-1\} \text{ satisfies } w_{\tau^{i+1}(\alpha)} = w_{\tau^{i+1}(\beta)}. \tag{13.189.6}$$

Now, we claim that

$$\tau^i(\alpha) < \tau^i(\beta) \qquad \text{for every } i \in \{0, 1, \ldots, j\}. \tag{13.189.7}$$

[*Proof of (13.189.7):* We shall prove (13.189.7) by induction on i:

Induction base: We have $\alpha < \beta$. In view of $\underbrace{\tau^0}_{=\mathrm{id}}(\alpha) = \alpha$ and $\underbrace{\tau^0}_{=\mathrm{id}}(\beta) = \beta$, this rewrites as $\tau^0(\alpha) < \tau^0(\beta)$. In other words, (13.189.7) holds for $i = 0$. This completes the induction base.

Induction step: Let $s \in \{0, 1, \ldots, j-1\}$. Assume that (13.189.7) holds for $i = s$. We must prove that (13.189.7) holds for $i = s + 1$.

We have assumed that (13.189.7) holds for $i = s$. In other words, we have $\tau^s(\alpha) < \tau^s(\beta)$. Moreover, (13.189.6) (applied to $i = s$) yields $w_{\tau^{s+1}(\alpha)} = w_{\tau^{s+1}(\beta)}$. In view of $\tau^{s+1}(\alpha) = \tau(\tau^s(\alpha))$ and $\tau^{s+1}(\beta) = \tau(\tau^s(\beta))$, this rewrites as $w_{\tau(\tau^s(\alpha))} = w_{\tau(\tau^s(\beta))}$. Hence, Lemma 6.6.6(e) (applied to $\tau^s(\alpha)$ and $\tau^s(\beta)$ instead of α and β) yields $\tau(\tau^s(\alpha)) < \tau(\tau^s(\beta))$ (since $\tau^s(\alpha) < \tau^s(\beta)$). In view of $\tau^{s+1}(\alpha) = \tau(\tau^s(\alpha))$ and $\tau^{s+1}(\beta) = \tau(\tau^s(\beta))$, this rewrites as $\tau^{s+1}(\alpha) < \tau^{s+1}(\beta)$. In other words, (13.189.7) holds for $i = s + 1$. This completes the induction step. Thus, (13.189.7) is proved by induction.]

Now, $j \in \{0, 1, \ldots, j\}$. Hence, (13.189.7) (applied to $i = j$) yields $\tau^j(\alpha) < \tau^j(\beta)$. Thus, Lemma 6.6.6(c) (applied to $\tau^j(\alpha)$ and $\tau^j(\beta)$ instead of α and β) yields $w_{\tau(\tau^j(\alpha))} \leq w_{\tau(\tau^j(\beta))}$. In view of $\tau\left(\tau^j(\alpha)\right) = \underbrace{\left(\tau \circ \tau^j\right)}_{=\tau^{j+1}}(\alpha) = \tau^{j+1}(\alpha)$ and $\tau\left(\tau^j(\beta)\right) = \underbrace{\left(\tau \circ \tau^j\right)}_{=\tau^{j+1}}(\beta) = \tau^{j+1}(\beta)$, this rewrites as $w_{\tau^{j+1}(\alpha)} \leq w_{\tau^{j+1}(\beta)}$. Thus, Lemma 6.6.6(h) is proved. □

Proof of Proposition 6.6.7. We have $w = (w_1, w_2, \ldots, w_n)$ (since $w \in \mathfrak{A}^n$).

Let k be the size of z. Thus, $k = |z|$.

(a) Let $h \in z$. We must prove that $[w_{\tau,h}] = \{w_{\tau,i} \mid i \in z\}$.

For each $u \in \mathbb{N}$, we set $h_u := \tau^u(h)$. Lemma 13.189.1(i) (applied to $p = h$ and $p_u = h_u$) yields $\operatorname{ord}_\tau(h) = k$.

Proposition 6.6.5(a) yields that the word $w_{\tau,h}$ is nonempty and has length $\operatorname{ord}_\tau(h)$. In other words, the word $w_{\tau,h}$ is nonempty and has length k (since $\operatorname{ord}_\tau(h) = k$). Thus, $[w_{\tau,h}]$ is the k-necklace that contains $w_{\tau,h}$ (by the definition of $[w_{\tau,h}]$). In other words, $[w_{\tau,h}]$ is the orbit of the C-action on $\mathfrak{A}^k$ that contains $w_{\tau,h}$ (since a k-necklace is the same thing as an orbit of the C-action on $\mathfrak{A}^k$). In other words, $[w_{\tau,h}] = C \cdot w_{\tau,h}$.

But $C = \left\{c^i \mid i \in \mathbb{Z}\right\}$ (since c is a generator of the cyclic group C). Hence,

$$[w_{\tau,h}] = \underbrace{C}_{=\{c^i \mid i \in \mathbb{Z}\}} \cdot w_{\tau,h} = \left\{c^i \mid i \in \mathbb{Z}\right\} \cdot w_{\tau,h}$$

$$= \left\{c^i \cdot w_{\tau,h} \mid i \in \mathbb{Z}\right\}. \tag{13.189.8}$$

On the other hand, z is the cycle of τ that contains h (since z is a cycle of τ, and since $h \in z$). Hence, $z = \left\{\tau^i(h) \mid i \in \mathbb{Z}\right\}$, and thus

$$\{w_{\tau,u} \mid u \in z\} = \left\{w_{\tau,u} \mid u \in \left\{\tau^i(h) \mid i \in \mathbb{Z}\right\}\right\}$$
$$= \left\{ \underbrace{w_{\tau,\tau^i(h)}}_{\substack{=c^i \cdot w_{\tau,h} \\ \text{(by Proposition 6.6.5(e))}}} \mid i \in \mathbb{Z} \right\} = \left\{c^i \cdot w_{\tau,h} \mid i \in \mathbb{Z}\right\}.$$

Comparing this with (13.189.8), we obtain $[w_{\tau,h}] = \{w_{\tau,u} \mid u \in z\} = \{w_{\tau,i} \mid i \in z\}$ (here, we have renamed the index u as i). This proves Proposition 6.6.7(a).

(b) Let α and β be two distinct elements of z. We must prove that $w_{\tau,\alpha} \neq w_{\tau,\beta}$.

We have $\alpha \neq \beta$ (since α and β are distinct). Thus, either $\alpha < \beta$ or $\alpha > \beta$. We WLOG assume that $\alpha < \beta$ (since otherwise, it suffices to swap α with β).

We must prove that $w_{\tau,\alpha} \neq w_{\tau,\beta}$. Assume the contrary. Thus, $w_{\tau,\alpha} = w_{\tau,\beta}$. Lemma 6.6.6(g) thus shows that

$$\tau^i(\alpha) < \tau^i(\beta) \qquad \text{for each } i \in \mathbb{N}. \tag{13.189.9}$$

On the other hand, we have

$$z = \left\{\tau^0(\gamma), \tau^1(\gamma), \ldots, \tau^{k-1}(\gamma)\right\} \qquad \text{for each } \gamma \in z. \tag{13.189.10}$$

[*Proof of (13.189.10):* Let $\gamma \in z$. For each $u \in \mathbb{N}$, we set $\gamma_u := \tau^u(\gamma)$. Then, Lemma 13.189.1(c) (applied to $p = \gamma$ and $p_u = \gamma_u$) yields

$$z = \{\gamma_0, \gamma_1, \ldots, \gamma_{k-1}\} = \left\{\tau^0(\gamma), \tau^1(\gamma), \ldots, \tau^{k-1}(\gamma)\right\}$$

(since each $u \in \{0, 1, \ldots, k-1\}$ satisfies $\gamma_u = \tau^u(\gamma)$ (by the definition of γ_u)). This proves (13.189.10).]

Applying (13.189.10) to $\gamma = \beta$, we obtain $z = \left\{\tau^0(\beta), \tau^1(\beta), \ldots, \tau^{k-1}(\beta)\right\}$.

Now, let m be the smallest element of z. Then, $m \in z = \left\{\tau^0(\beta), \tau^1(\beta), \ldots, \tau^{k-1}(\beta)\right\}$. Hence, there exists some $i \in \{0, 1, \ldots, k-1\}$ such that $m = \tau^i(\beta)$. Consider this i.

But (13.189.10) (applied to $\gamma = \alpha$) yields $z = \left\{\tau^0(\alpha), \tau^1(\alpha), \ldots, \tau^{k-1}(\alpha)\right\}$. From $i \in \{0, 1, \ldots, k-1\}$, we obtain $\tau^i(\alpha) \in \left\{\tau^0(\alpha), \tau^1(\alpha), \ldots, \tau^{k-1}(\alpha)\right\}$. In other words, $\tau^i(\alpha) \in z$ (since $z = \left\{\tau^0(\alpha), \tau^1(\alpha), \ldots, \tau^{k-1}(\alpha)\right\}$).

But m is the **smallest** element of z. Thus, $p \geq m$ for each $p \in z$. We can apply this to $p = \tau^i(\alpha)$ (since $\tau^i(\alpha) \in z$), and thus obtain $\tau^i(\alpha) \geq m = \tau^i(\beta)$. But (13.189.9) yields $\tau^i(\alpha) < \tau^i(\beta)$. These two inequalities clearly contradict one another.

This contradiction shows that our assumption was false. Hence, $w_{\tau,\alpha} \neq w_{\tau,\beta}$ is proved. Thus, Proposition 6.6.7(b) follows.

(c) There are k many elements $i \in z$ (since k is the size of z). The words $w_{\tau,i}$ corresponding to these k many elements i are all distinct (by Proposition 6.6.7(b)). Thus, the set $\{w_{\tau,i} \mid i \in z\}$ (consisting of these words) has size k. In other words, $|\{w_{\tau,i} \mid i \in z\}| = k$. But recall that $k = |z|$. Hence, $|\{w_{\tau,i} \mid i \in z\}| = k = |z|$. This proves Proposition 6.6.7(c).

(d) The set z is a cycle of τ, and thus is nonempty (since any cycle of a permutation is nonempty). Hence, there exists some $h \in z$. Consider this h. Proposition 6.6.7(a) yields $[w_{\tau,h}] = \{w_{\tau,i} \mid i \in z\}$.

But $[w_{\tau,h}]$ is the k-necklace that contains $w_{\tau,h}$ (as we have showed in the proof of Proposition 6.6.7(a) above). Hence, $[w_{\tau,h}]$ is a k-necklace.

Proposition 6.6.7(c) yields $|\{w_{\tau,i} \mid i \in z\}| = |z| = k$ (since $k = |z|$). In view of $[w_{\tau,h}] = \{w_{\tau,i} \mid i \in z\}$, this rewrites as $|[w_{\tau,h}]| = k$.

The period of the necklace $[w_{\tau,h}]$ is $|[w_{\tau,h}]|$ (by the definition of the period of a necklace). In other words, the period of the necklace $[w_{\tau,h}]$ is k (since $|[w_{\tau,h}]| = k$).

But $[w_{\tau,h}]$ is a k-necklace. Hence, this k-necklace $[w_{\tau,h}]$ is aperiodic if and only if its period is k (by the definition of "aperiodic"). Thus, this k-necklace $[w_{\tau,h}]$ is aperiodic (since its period is k). In view of $[w_{\tau,h}] = \{w_{\tau,i} \mid i \in z\}$, this rewrites as follows: The k-necklace $\{w_{\tau,i} \mid i \in z\}$ is aperiodic. Hence, the set $\{w_{\tau,i} \mid i \in z\}$ is an aperiodic necklace. This proves Proposition 6.6.7(d). □

We have now proved Proposition 6.6.5, Lemma 6.6.6 and Proposition 6.6.7. This solves Exercise 6.6.8.

13.190. **Solution to Exercise 6.6.23.** *Solution to Exercise 6.6.23.* In preparation for solving Exercise 6.6.23, we first show a few simple lemmas about necklaces:

Lemma 13.190.1. *Let $u \in \mathfrak{A}^*$ be a nonempty word. Then, $u \in [u]$.*

Proof of Lemma 13.190.1. The word u is nonempty. In other words, $u \in \mathfrak{A}^n$ for some positive integer n. Consider this n. Thus, $[u]$ is the n-necklace containing u (by the definition of $[u]$). Hence, $[u]$ contains u. In other words, $u \in [u]$. This proves Lemma 13.190.1. □

Lemma 13.190.2. *Let N be a necklace. Let $u \in N$. Then, $N = [u]$.*

Proof of Lemma 13.190.2. We know that N is a necklace. In other words, N is an n-necklace for some positive integer n (by the definition of a necklace). Consider this n. We now know that N is an n-necklace; in other words, N is an orbit of the C-action on $\mathfrak{A}^n$ (by the definition of an n-necklace). Hence, N is a set of words of length n. Thus, u is a word of length n (since $u \in N$).

Recall that N is an orbit of the C-action on $\mathfrak{A}^n$. Since N contains u (because $u \in N$), we thus conclude that N is the orbit of the C-action on $\mathfrak{A}^n$ that contains u. In other words, N is the n-necklace that contains u (because an n-necklace is the same thing as an orbit of the C-action on $\mathfrak{A}^n$). In other words, $N = [u]$ (since the n-necklace that contains u has been denoted by $[u]$). This proves Lemma 13.190.2. □

Lemma 13.190.3. *Let $u \in \mathfrak{A}^*$ be a Lyndon word. Then, the necklace $[u]$ is aperiodic.*

Proof of Lemma 13.190.3. The word u is Lyndon, and thus is nonempty (since any Lyndon word is nonempty by definition). Hence, Lemma 13.190.1 yields $u \in [u]$. In other words, the necklace $[u]$ contains u.

Thus, the necklace $[u]$ contains the word u, which is a Lyndon word. Hence, the necklace $[u]$ contains a Lyndon word (namely, u). If the necklace $[u]$ was not aperiodic, then Exercise 6.1.34(d) (applied to $N = [u]$) would show that $[u]$ contains no Lyndon word; but this would contradict the previous sentence. Hence, the necklace $[u]$ must be aperiodic. This proves Lemma 13.190.3. □

Lemma 13.190.4. *Let $u \in \mathfrak{A}^*$ be a nonempty word such that the necklace $[u]$ is aperiodic. Then, $|[u]| = \ell(u)$.*

Proof of Lemma 13.190.4. The word $u \in \mathfrak{A}^*$ is nonempty. Thus, there exists a positive integer p such that $u \in \mathfrak{A}^p$. Consider this p. Hence, $[u]$ is a p-necklace. Also, from $u \in \mathfrak{A}^p$, we obtain $\ell(u) = p$.

The p-necklace $[u]$ is aperiodic. In other words, its period is p (by the definition of an aperiodic p-necklace). Thus,

$$p = (\text{period of the } p\text{-necklace } [u]) = |[u]|$$

(by the definition of the period of a p-necklace). Therefore, $|[u]| = p = \ell(u)$ (since $\ell(u) = p$). This proves Lemma 13.190.4. □

Lemma 13.190.5. *Let k be a positive integer. Let $v \in \mathfrak{A}^k$ be such that the necklace $[v]$ is not aperiodic. Then, there exists some $h \in \{1, 2, \ldots, k-1\}$ such that $c^h \cdot v = v$.*

Proof of Lemma 13.190.5. We have $v \in \mathfrak{A}^k$. Thus, $[v]$ is a k-necklace. Hence, Exercise 6.1.34(a) (applied to k and $[v]$ instead of n and N) yields that $[v]$ is a finite nonempty set and satisfies $|[v]| \mid k$. From $|[v]| \mid k$, we obtain $|[v]| \leq k$ (since k is a positive integer).

Next, we claim the following:

Claim 1: The k elements $c^0 \cdot v, c^1 \cdot v, \ldots, c^{k-1} \cdot v$ are not distinct.

[*Proof of Claim 1:* Assume the contrary. Thus, the k elements $c^0 \cdot v, c^1 \cdot v, \ldots, c^{k-1} \cdot v$ are distinct.

The necklace $[v]$ is defined to be the k-necklace containing v (since $v \in \mathfrak{A}^k$). In other words, the necklace $[v]$ is the C-orbit on $\mathfrak{A}^k$ containing v (since a k-necklace is the same thing as a C-orbit on $\mathfrak{A}^k$). In other words, the necklace $[v]$ is the C-orbit of $v \in \mathfrak{A}^k$. In other words, the necklace $[v]$ is the set $C \cdot v$ (since the C-orbit of $v \in \mathfrak{A}^k$ is the set $C \cdot v$). In other words, $[v] = C \cdot v$. Hence, $|[v]| = |C \cdot v|$.

The k elements $c^0 \cdot v, c^1 \cdot v, \ldots, c^{k-1} \cdot v$ all belong to $C \cdot v$ (since $c^0, c^1, \ldots, c^{k-1}$ all belong to C) and are distinct (by our assumption). Hence, the set $C \cdot v$ contains (at least) k distinct elements (namely, $c^0 \cdot v, c^1 \cdot v, \ldots, c^{k-1} \cdot v$). Thus, $|C \cdot v| \geq k$. Thus, $|[v]| = |C \cdot v| \geq k$. Combining this with $|[v]| \leq k$, we obtain $|[v]| = k$. In other words, the period of $[v]$ is k (since the period of $[v]$ is defined as the integer $|[v]|$). But $[v]$ is a k-necklace. Hence, the necklace $[v]$ is aperiodic if and only if its period is k (by the definition of an aperiodic necklace). Thus, the necklace $[v]$ is aperiodic (since its period is k). This contradicts the fact that the necklace $[v]$ is not aperiodic. This contradiction shows that our assumption was wrong. This completes our proof of Claim 1.]

Claim 1 shows that the k elements $c^0 \cdot v, c^1 \cdot v, \ldots, c^{k-1} \cdot v$ are not distinct. In other words, there exist two elements x and y of $\{0, 1, \ldots, k-1\}$ such that $x < y$ and $c^x \cdot v = c^y \cdot v$. Consider these x and y. From $x \in \{0, 1, \ldots, k-1\}$ and $y \in \{0, 1, \ldots, k-1\}$ and $x < y$, we obtain $0 \leq x < y \leq k-1$, so that $y - x \in \{1, 2, \ldots, k-1\}$. Furthermore,

$$\underbrace{c^{y-x}}_{=c^{-x}c^y} \cdot v = \left(c^{-x}c^y\right) \cdot v = c^{-x} \cdot \underbrace{\left(c^y \cdot v\right)}_{=c^x \cdot v} = c^{-x} \cdot \left(c^x \cdot v\right) = \underbrace{\left(c^{-x}c^x\right)}_{=\mathrm{id}} \cdot v = v.$$

Hence, there exists some $h \in \{1, 2, \ldots, k-1\}$ such that $c^h \cdot v = v$ (namely, $h = y - x$). This proves Lemma 13.190.5. □

Lemma 13.190.6. *Let n be a positive integer. Let d be a positive divisor of n. Thus, n/d is a positive integer.*

Let $q \in \mathfrak{A}^{n/d}$. Then, the n/d-necklace $[q]$ and the n-necklace $\left[q^d\right]$ satisfy $\left|\left[q^d\right]\right| = |[q]| \leq n/d$.

Proof of Lemma 13.190.6. Exercise 6.1.34(a) (applied to n/d instead of n) shows that every n/d-necklace N is a finite nonempty set and satisfies $|N| \mid n/d$. Applying this to $N = [q]$, we conclude that $[q]$ is a finite nonempty set and satisfies $|[q]| \mid n/d$. From $|[q]| \mid n/d$, we obtain $|[q]| \leq n/d$ (since $|[q]| \in \mathbb{N}$ and since n/d is a positive integer).

Now, consider the map $\Delta : \mathfrak{A}^{n/d} \to \mathfrak{A}^n$ defined in Lemma 13.147.5. The definition of Δ yields $\Delta(q) = q^d$. Hence, $q^d = \Delta(q) \in \mathfrak{A}^n$.

The necklace $[q]$ is defined to be the n/d-necklace containing q (since $q \in \mathfrak{A}^{n/d}$). In other words, the necklace $[q]$ is the C-orbit on $\mathfrak{A}^{n/d}$ containing q (since an n/d-necklace is the same thing as a C-orbit on $\mathfrak{A}^{n/d}$). In other words, the necklace $[q]$ is the C-orbit of $q \in \mathfrak{A}^{n/d}$. In other words, the necklace $[q]$ is the set $C \cdot q$ (since the C-orbit of $q \in \mathfrak{A}^{n/d}$ is the set $C \cdot q$). In other words, $[q] = C \cdot q$. The same argument (applied to n and q^d instead of n/d and q) yields $\left[q^d\right] = C \cdot q^d$.

But Lemma 13.147.5(c) shows that the map Δ is injective. Hence, $|\Delta(S)| = |S|$ for any finite subset S of $\mathfrak{A}^{n/d}$. Applying this to $S = [q]$, we obtain $|\Delta([q])| = |[q]|$ (since $[q]$ is a finite subset of $\mathfrak{A}^{n/d}$).

On the other hand, Lemma 13.147.5(b) shows that the map Δ is C-equivariant. Therefore, $\Delta(C \cdot q) = C \cdot \underbrace{\Delta(q)}_{=q^d} = C \cdot q^d$. This rewrites as $\Delta([q]) = [q^d]$ (since $[q] = C \cdot q$ and $[q^d] = C \cdot q^d$). Hence, $|\Delta([q])| = |[q^d]|$. Therefore, $|[q^d]| = |\Delta([q])| = |[q]| \leq n/d$. This proves Lemma 13.190.6. □

We can now start proving the results required in Exercise 6.6.23:

Proof of Proposition 6.6.15. Define $n \in \mathbb{N}$ by $n = \ell(w)$. Then, $n = \ell(w) > 0$ (since w is nonempty), so that n is a positive integer. Also, $w \in \mathfrak{A}^n$ (since $\ell(w) = n$).

We must show that the word w is aperiodic if and only if the necklace $[w]$ is aperiodic. In other words, we must prove the following two claims:

Claim 1: If the word w is aperiodic, then the necklace $[w]$ is aperiodic.

Claim 2: If the necklace $[w]$ is aperiodic, then the word w is aperiodic.

[*Proof of Claim 1:* Assume that the word w is aperiodic. In other words, there exist no $m \geq 2$ and $u \in \mathfrak{A}^*$ satisfying $w = u^m$ (by the definition of aperiodic words).

We must prove that the necklace $[w]$ is aperiodic. Indeed, assume the contrary. Then, the necklace $[w]$ is not aperiodic. Hence, Lemma 13.190.5 (applied to $v = w$ and $k = n$) yields that there exists some $h \in \{1, 2, \ldots, n-1\}$ such that $c^h \cdot w = w$. Consider this h.

From $h \in \{1, 2, \ldots, n-1\}$, we obtain $1 \leq h \leq n-1$, so that $h \geq 1 > 0$ and $n - \underbrace{h}_{\leq n-1} \geq n - (n-1) = 1 > 0$.

We have $w = (w_1, w_2, \ldots, w_n)$ (since $w \in \mathfrak{A}^n$). Define two words p and q by $p = (w_1, w_2, \ldots, w_h)$ and $q = (w_{h+1}, w_{h+2}, \ldots, w_n)$. Then, these words p and q have lengths $\ell(p) = h$ and $\ell(q) = n - h$, and thus are nonempty (since $\ell(p) = h > 0$ and $\ell(q) = n - h > 0$). They further satisfy

$$\begin{aligned} w &= (w_1, w_2, \ldots, w_n) = (w_1, w_2, \ldots, w_h, w_{h+1}, w_{h+2}, \ldots, w_n) \\ &= \underbrace{(w_1, w_2, \ldots, w_h)}_{=p} \underbrace{(w_{h+1}, w_{h+2}, \ldots, w_n)}_{=q} = pq. \end{aligned}$$

Recall that c acts on $\mathfrak{A}^n$ by cyclically rotating n-tuples one step to the left (that is, we have $c \cdot (a_1, a_2, \ldots, a_n) = (a_2, a_3, \ldots, a_n, a_1)$ for each $(a_1, a_2, \ldots, a_n) \in \mathfrak{A}^n$). Thus, c^h acts on $\mathfrak{A}^n$ by cyclically rotating n-tuples h steps to the left. In other words,

$$c^h \cdot (a_1, a_2, \ldots, a_n) = (a_{h+1}, a_{h+2}, \ldots, a_n, a_1, a_2, \ldots, a_h)$$

for each $(a_1, a_2, \ldots, a_n) \in \mathfrak{A}^n$ (since $h \in \{1, 2, \ldots, n-1\} \subset \{0, 1, \ldots, n\}$). Applying this to $(a_1, a_2, \ldots, a_n) = (w_1, w_2, \ldots, w_n)$, we obtain

$$\begin{aligned} c^h \cdot (w_1, w_2, \ldots, w_n) &= (w_{h+1}, w_{h+2}, \ldots, w_n, w_1, w_2, \ldots, w_h) \\ &= \underbrace{(w_{h+1}, w_{h+2}, \ldots, w_n)}_{=q} \underbrace{(w_1, w_2, \ldots, w_h)}_{=p} = qp. \end{aligned}$$

Comparing this with

$$c^h \cdot \underbrace{(w_1, w_2, \ldots, w_n)}_{=w} = c^h \cdot w = w = pq,$$

we obtain $pq = qp$. Hence, Proposition 6.1.4 (applied to $u = p$ and $v = q$) yields that there exist a $t \in \mathfrak{A}^*$ and two nonnegative integers N and M [1192] such that $p = t^N$ and $q = t^M$. Consider these t, N and M. From $p = t^N$, we obtain $\ell(p) = \ell(t^N) = N\ell(t)$, so that $N\ell(t) = \ell(p) = h \neq 0$ (since $h > 0$). Hence, $N \neq 0$, so that $N \geq 1$ (because N is a nonnegative integer). Also, from $q = t^M$, we obtain $\ell(q) = \ell(t^M) = M\ell(t)$, so that $M\ell(t) = \ell(q) = n - h \neq 0$ (since $n - h > 0$). Hence, $M \neq 0$, so that $M \geq 1$ (since M is a nonnegative integer). Now, $\underbrace{N}_{\geq 1} + \underbrace{M}_{\geq 1} \geq 1 + 1 = 2$ and $w = \underbrace{p}_{=t^N} \underbrace{q}_{=t^M} = t^N t^M = t^{N+M}$. Hence, there exist $m \geq 2$ and $u \in \mathfrak{A}^*$ satisfying $w = u^m$ (namely, $m = N + M$ and $u = t$). This contradicts the fact that there exist no $m \geq 2$ and $u \in \mathfrak{A}^*$ satisfying $w = u^m$. This contradiction shows that our assumption was false. Hence, the necklace $[w]$ is aperiodic. This proves Claim 1.]

[1192] Here, we are using the letters N and M for what was called n and m in Proposition 6.1.4 (since the letter n already has a different meaning in our current situation).

[*Proof of Claim 2:* Assume that the necklace $[w]$ is aperiodic. We must prove that the word w is aperiodic. Let $m \geq 2$ and $u \in \mathfrak{A}^*$ be such that $w = u^m$. We shall derive a contradiction.

From $w = u^m$, we obtain $\ell(w) = \ell(u^m) = m\ell(u)$, so that $m\ell(u) = \ell(w) = n$. Hence, $\ell(u) = n/m$ (since $m \geq 2 > 0$). Thus, $u \in \mathfrak{A}^{n/m}$. Also, m is a divisor of n (since $m\ell(u) = n$ with $\ell(u) \in \mathbb{Z}$), and is positive (since $m \geq 2 > 0$).

Hence, Lemma 13.190.6 (applied to $d = m$ and $q = u$) yields that the n/m-necklace $[u]$ and the n-necklace $[u^m]$ satisfy $|[u^m]| = |[u]| \leq n/m$. From $w = u^m$, we obtain $|[w]| = |[u^m]| \leq n/\underbrace{m}_{\geq 2} \leq n/2 < n$ (since $n > 0$).

But Lemma 13.190.4 (applied to w instead of u) yields that $|[w]| = \ell(w)$ (since the necklace $[w]$ is aperiodic). Hence, $|[w]| = \ell(w) = n$. But this contradicts $|[w]| < n$.

Forget that we fixed m and u. We thus have obtained a contradiction for every $m \geq 2$ and $u \in \mathfrak{A}^*$ satisfying $w = u^m$. Hence, there exist no $m \geq 2$ and $u \in \mathfrak{A}^*$ satisfying $w = u^m$. In other words, the word w is aperiodic (by the definition of an aperiodic word). This proves Claim 2.]

We have now proved both Claim 1 and Claim 2. Combining these two claims, we conclude that the word w is aperiodic if and only if the necklace $[w]$ is aperiodic. This proves Proposition 6.6.15. □

Proof of Corollary 6.6.16. The word w is aperiodic and thus nonempty (since any aperiodic word is nonempty). In other words, $\ell(w) > 0$. Let $n = \ell(w)$. Hence, $w \in \mathfrak{A}^n$. Thus, $c \cdot w \in \mathfrak{A}^n$, so that $\ell(c \cdot w) = n > 0$. Hence, the word $c \cdot w$ is nonempty.

Now, $[w]$ is the n-necklace containing w. In other words, $[w]$ is the C-orbit containing w (since the n-necklaces are exactly the C-orbits on $\mathfrak{A}^n$). In other words, $[w] = C \cdot w$ (where we are using the notation $C \cdot w$ for the C-orbit $\{d \cdot w \mid d \in C\}$). The same argument (applied to $c \cdot w$ instead of w) yields that $[c \cdot w] = C \cdot (c \cdot w)$. Hence,

$$[c \cdot w] = C \cdot (c \cdot w) = \underbrace{(Cc)}_{\substack{=C \\ \text{(since } C \text{ is a group)}}} \cdot w = C \cdot w = [w].$$

But Proposition 6.6.15 shows that the word w is aperiodic if and only if the necklace $[w]$ is aperiodic. Hence, the necklace $[w]$ is aperiodic (since the word w is aperiodic). In other words, the necklace $[c \cdot w]$ is aperiodic (since $[c \cdot w] = [w]$).

However, Proposition 6.6.15 (applied to $c \cdot w$ instead of w) shows that the word $c \cdot w$ is aperiodic if and only if the necklace $[c \cdot w]$ is aperiodic. Hence, the word $c \cdot w$ is aperiodic (since the necklace $[c \cdot w]$ is aperiodic). This proves Corollary 6.6.16. □

Proof of Corollary 6.6.17. Let N be an aperiodic necklace. We must prove that N is a set of aperiodic words. In other words, we must prove that each $w \in N$ is an aperiodic word.

So let $w \in N$. We shall prove that w is an aperiodic word.

Indeed, N is a necklace, i.e., an n-necklace for some positive integer n. Consider this n. Lemma 13.190.2 (applied to $u = w$) shows that $N = [w]$. Hence, $[w]$ is an aperiodic n-necklace (since N is an aperiodic n-necklace).

The word w has length n (since $[w]$ is an n-necklace) and thus is nonempty (since n is positive). Moreover, the necklace $[w]$ is aperiodic. Hence, Proposition 6.6.15 shows that the word w is aperiodic.

Forget that we fixed w. Thus, we have proved that each $w \in N$ is an aperiodic word. This completes the proof of Corollary 6.6.17. □

Proof of Proposition 6.6.19. We shall prove the following four claims:

Claim 1: The relation $\leq_\omega$ is reflexive.

Claim 2: The relation $\leq_\omega$ is transitive.

Claim 3: The relation $\leq_\omega$ is antisymmetric.

Claim 4: The relation $\leq_\omega$ is total.

[*Proof of Claim 1:* Each $a \in \mathfrak{A}^{\mathfrak{a}}$ satisfies $aa \leq aa$. In other words, each $a \in \mathfrak{A}^{\mathfrak{a}}$ satisfies $a \leq_\omega a$ (by the definition of the relation $\leq_\omega$). In other words, the relation $\leq_\omega$ is reflexive. This proves Claim 1.]

[*Proof of Claim 2:* Let $x, y, z \in \mathfrak{A}^{\mathfrak{a}}$ satisfy $x \leq_\omega y$ and $y \leq_\omega z$. We shall show that $x \leq_\omega z$.

We have assumed that $x \leq_\omega y$. In other words, $xy \leq yx$ (by the definition of the relation $\leq_\omega$). In other words, $yx \geq xy$.

We have assumed that $y \leq_\omega z$. In other words, $yz \leq zy$ (by the definition of the relation $\leq_\omega$). In other words, $zy \geq yz$.

The word y is aperiodic (since $y \in \mathfrak{A}^{\mathfrak{a}}$) and thus nonempty (since any aperiodic word is nonempty). Hence, Corollary 6.1.6 (applied to $u = z$, $v = y$ and $w = x$) yields $zx \geq xz$. In other words, $xz \leq zx$. In other words, $x \leq_\omega z$ (by the definition of the relation $\leq_\omega$).

Now, forget that we fixed x, y, z. We thus have proved that if $x, y, z \in \mathfrak{A}^{\mathfrak{a}}$ satisfy $x \leq_\omega y$ and $y \leq_\omega z$, then $x \leq_\omega z$. In other words, the relation $\leq_\omega$ is transitive. This proves Claim 2.]

[*Proof of Claim 3:* Let $a, b \in \mathfrak{A}^{\mathfrak{a}}$ satisfy $a \leq_\omega b$ and $b \leq_\omega a$. We shall show that $a = b$.

The word b is aperiodic (since $b \in \mathfrak{A}^{\mathfrak{a}}$). In other words, b is a nonempty word with the property that

$$\text{there exist no } m \geq 2 \text{ and } u \in \mathfrak{A}^* \text{ satisfying } b = u^m \tag{13.190.1}$$

(by the definition of an aperiodic word).

We have assumed that $a \leq_\omega b$. In other words, $ab \leq ba$ (by the definition of the relation $\leq_\omega$). Likewise, $ba \leq ab$ (since $b \leq_\omega a$). Combining these two inequalities, we obtain $ab = ba$. Hence, Proposition 6.1.4 (applied to $u = a$ and $v = b$) yields that there exist a $t \in \mathfrak{A}^*$ and two nonnegative integers n and m such that $a = t^n$ and $b = t^m$. Consider these t, n and m.

From $b = t^m$, we obtain $\ell(b) = \ell(t^m) = m\ell(t)$, thus $m\ell(t) = \ell(b) \neq 0$ (since b is nonempty). Hence, $m \neq 0$, so that $m \geq 1$ (since m is a nonnegative integer). Note that the word t satisfies $b = t^m$; thus, there exists a word $u \in \mathfrak{A}^*$ satisfying $b = u^m$ (namely, $u = t$). If we had $m \geq 2$, then this would violate (13.190.1). Hence, we cannot have $m \geq 2$. Thus, $m < 2$. Combining this with $m \geq 1$, we obtain $m = 1$. Now, $b = t^m = t^1$ (since $m = 1$). Likewise, $a = t^1$. Hence, $a = t^1 = b$.

Now, forget that we fixed a, b. We thus have proved that if $a, b \in \mathfrak{A}^{\mathfrak{a}}$ satisfy $a \leq_\omega b$ and $b \leq_\omega a$, then $a = b$. In other words, the relation $\leq_\omega$ is antisymmetric. This proves Claim 3.]

[*Proof of Claim 4:* Let $a, b \in \mathfrak{A}^{\mathfrak{a}}$. We shall prove that we have $a \leq_\omega b$ or $b \leq_\omega a$.

Indeed, the relation $\leq$ on $\mathfrak{A}^*$ is total (since the lexicographic order on words is a total order). Thus, we have $ab \leq ba$ or $ba \leq ab$. In other words, we have $a \leq_\omega b$ or $b \leq_\omega a$ (because the relation $a \leq_\omega b$ is equivalent to $ab \leq ba$ [1193], whereas the relation $b \leq_\omega a$ is equivalent to $ba \leq ab$ [1194]).

Now, forget that we fixed a, b. We thus have proved that any $a, b \in \mathfrak{A}^{\mathfrak{a}}$ satisfy $a \leq_\omega b$ or $b \leq_\omega a$. In other words, the relation $\leq_\omega$ is total. This proves Claim 4.]

Now, the relation $\leq_\omega$ is reflexive (by Claim 1), transitive (by Claim 2) and antisymmetric (by Claim 3). Hence, it is the smaller-or-equal relation of a partial order. This partial order must furthermore be a total order, since the relation $\leq_\omega$ is total (by Claim 4). Thus, the relation $\leq_\omega$ is the smaller-or-equal relation of a total order. This proves Proposition 6.6.19. □

Before we prove Proposition 6.6.20, let us show some more basic lemmas:

Lemma 13.190.7. *Let $u \in \mathfrak{A}^*$ be a nonempty word. Let m be a positive integer. Then, $\left(c^i \cdot u\right)^m = c^i \cdot (u^m)$ for each $i \in \mathbb{N}$.*

Proof of Lemma 13.190.7. Let $i \in \mathbb{N}$.

Let $n = \ell(u) \cdot m$ and $d = m$. We know that m is a positive integer; in other words, d is a positive integer (since $d = m$). Also, $n = \ell(u) \cdot \underbrace{m}_{=d} = \ell(u) \cdot d$; hence, d is a divisor of n. Finally, $\ell(u)$ is a positive integer (since u is nonempty). Now, both $\ell(u)$ and m are positive integers. Hence, the product $\ell(u) \cdot m$ is a positive integer as well. In other words, n is a positive integer (since $n = \ell(u) \cdot m$).

Consider the map $\Delta : \mathfrak{A}^{n/d} \to \mathfrak{A}^n$ defined in Lemma 13.147.5.

We have $n = \ell(u) \cdot d$, so that $\ell(u) = n/d$ (since $d \neq 0$ (because d is positive)). Hence, $u \in \mathfrak{A}^{n/d}$. Thus, the definition of Δ yields $\Delta(u) = u^d = u^m$ (since $d = m$). Also, the definition of Δ yields $\Delta\left(c^i u\right) = \left(\underbrace{c^i u}_{=c^i \cdot u}\right)^d = \left(c^i \cdot u\right)^d = \left(c^i \cdot u\right)^m$ (since $d = m$). But Lemma 13.147.5(b) shows that the map Δ is C-equivariant; in other words, we have $\Delta(gw) = g \cdot \Delta(w)$ for every $g \in C$ and $w \in \mathfrak{A}^{n/d}$. Applying this to $g = c^i$ and

[1193] by the definition of the relation $\leq_\omega$

[1194] by the definition of the relation $\leq_\omega$

$w = u$, we obtain $\Delta\left(c^i u\right) = c^i \cdot \underbrace{\Delta(u)}_{=u^m} = c^i \cdot (u^m)$. Comparing this with $\Delta\left(c^i u\right) = \left(c^i \cdot u\right)^m$, we obtain $\left(c^i \cdot u\right)^m = c^i \cdot (u^m)$. This proves Lemma 13.190.7. □

Lemma 13.190.8. *Let n be a positive integer. Let $w \in \mathfrak{A}^n$ be a word. Then, $\left(c^i \cdot w\right)_j = w_{i+j}$ for each $i \in \mathbb{N}$ and each $j \in \{1, 2, \ldots, n-i\}$.*

Proof of Lemma 13.190.8. Let $i \in \mathbb{N}$, and let $j \in \{1, 2, \ldots, n-i\}$. Then, $1 \leq j \leq n-i$, so that $n-i \geq 1 \geq 0$ and thus $n \geq i$. Hence, $i \leq n$, so that $i \in \{0, 1, \ldots, n\}$ (since $i \in \mathbb{N}$).

Recall that c acts on $\mathfrak{A}^n$ by cyclically rotating n-tuples one step to the left (that is, we have $c \cdot (a_1, a_2, \ldots, a_n) = (a_2, a_3, \ldots, a_n, a_1)$ for each $(a_1, a_2, \ldots, a_n) \in \mathfrak{A}^n$). Thus, c^i acts on $\mathfrak{A}^n$ by cyclically rotating n-tuples i steps to the left. In other words, for each $(a_1, a_2, \ldots, a_n) \in \mathfrak{A}^n$, we have

$$c^i \cdot (a_1, a_2, \ldots, a_n) = (a_{i+1}, a_{i+2}, \ldots, a_n, a_1, a_2, \ldots, a_i)$$

(since $i \in \{0, 1, \ldots, n\}$). Applying this to $a_k = w_k$, we obtain

$$c^i \cdot (w_1, w_2, \ldots, w_n) = (w_{i+1}, w_{i+2}, \ldots, w_n, w_1, w_2, \ldots, w_i).$$

But $w = (w_1, w_2, \ldots, w_n)$ (since $w \in \mathfrak{A}^n$), and thus

$$c^i \cdot w = c^i \cdot (w_1, w_2, \ldots, w_n) = (w_{i+1}, w_{i+2}, \ldots, w_n, w_1, w_2, \ldots, w_i).$$

Hence, the first $n-i$ letters of the word $c^i \cdot w$ are $w_{i+1}, w_{i+2}, \ldots, w_n$ (in this order). In other words, for each $k \in \{1, 2, \ldots, n-i\}$, we have

$$\left(\text{the } k\text{-th letter of } c^i \cdot w\right) = w_{i+k}.$$

Applying this to $k = j$, we obtain

$$\left(\text{the } j\text{-th letter of } c^i \cdot w\right) = w_{i+j}$$

(since $j \in \{1, 2, \ldots, n-i\}$). Hence,

$$\left(c^i \cdot w\right)_j = \left(\text{the } j\text{-th letter of } c^i \cdot w\right) = w_{i+j}.$$

This proves Lemma 13.190.8. □

Lemma 13.190.9. *Let $w \in \mathfrak{A}^*$ be a nonempty word. Let $m \in \mathbb{N}$. Then, $\left(c^i \cdot w\right)_1 = (w^m)_{i+1}$ for each $i \in \{0, 1, \ldots, m\ell(w) - 1\}$.*

Proof of Lemma 13.190.9. Let $n = \ell(w)$; thus, $w \in \mathfrak{A}^n$. The word w is nonempty. Hence, $\ell(w)$ is a positive integer. In other words, n is a positive integer (since $n = \ell(w)$).

Let $v = c^i \cdot w$. Then, $v \in \mathfrak{A}^n$ (since $w \in \mathfrak{A}^n$). Thus, $\ell(v) = n$.

Let $i \in \{0, 1, \ldots, m\ell(w) - 1\}$. Then, $0 \leq i < m\ell(w)$, so that $m\ell(w) > 0$ and thus $m\ell(w) \neq 0$. This entails $m \neq 0$, so that $m > 0$ (since $m \in \mathbb{N}$). Hence, the word v is a prefix of v^m, and thus has the same first letter as v^m (since the word v is nonempty[1195], and thus has a first letter). In other words, $v_1 = (v^m)_1$.

Let $N = m\ell(w)$. Thus, $i \in \{0, 1, \ldots, m\ell(w) - 1\} = \{0, 1, \ldots, N-1\}$ (since $m\ell(w) = N$), so that $i + 1 \in \{1, 2, \ldots, N\}$. Hence, $1 \leq i + 1 \leq N$, so that $N \geq 1$. This shows that N is a positive integer. Also, $i + 1 \leq N$, thus $N \geq i + 1$, hence $N - i \geq 1$ and thus $1 \leq N - i$. Hence, $1 \in \{1, 2, \ldots, N - i\}$.

We have $\ell(w^m) = m\ell(w) = N$ (since $N = m\ell(w)$), so that $w^m \in \mathfrak{A}^N$. Lemma 13.190.8 (applied to N, w^m and 1 instead of n, w and j) thus yields $\left(c^i \cdot (w^m)\right)_1 = (w^m)_{i+1}$. But Lemma 13.190.7 (applied to $u = w$) yields $\left(c^i \cdot w\right)^m = c^i \cdot (w^m)$. In view of $c^i \cdot w = v$, this rewrites as $v^m = c^i \cdot (w^m)$. Hence, $(v^m)_1 = \left(c^i \cdot (w^m)\right)_1 = (w^m)_{i+1}$. Hence, $v_1 = (v^m)_1 = (w^m)_{i+1}$. In view of $v = c^i \cdot w$, this rewrites as $\left(c^i \cdot w\right)_1 = (w^m)_{i+1}$. This proves Lemma 13.190.9. □

Lemma 13.190.10. *Let $u, v \in \mathfrak{A}^*$ be two aperiodic words such that $u \neq v$ and $u \leq_\omega v$. Let g, n and m be three positive integers such that $g = n\ell(v) = m\ell(u)$. Then, there exists a $k \in \{1, 2, \ldots, g\}$ such that $(u^m)_k < (v^n)_k$, and such that every $j \in \{1, 2, \ldots, k-1\}$ satisfies $(u^m)_j = (v^n)_j$.*

[1195] because $\ell(v) = n > 0$

Proof of Lemma 13.190.10. We have $\ell\left(u^m\right) = m\ell\left(u\right) = g$ (since $g = m\ell\left(u\right)$) and $\ell\left(v^n\right) = n\ell\left(v\right) = g$ (since $g = n\ell\left(v\right)$). Hence, $\ell\left(u^m\right) = g = \ell\left(v^n\right)$; in other words, the words u^m and v^n have the same length.

Proposition 6.6.19 shows that the relation $\leq_\omega$ on the set $\mathfrak{A}^{\mathfrak{a}}$ is the smaller-or-equal relation of a total order. Hence, in particular, this relation $\leq_\omega$ is antisymmetric. Thus, we don't have $v \leq_\omega u$ (because otherwise, we could combine $u \leq_\omega v$ with $v \leq_\omega u$ to obtain $u = v$, which would contradict $u \neq v$). In other words, we don't have $vu \leq uv$ (since the relation $v \leq_\omega u$ means the same as $vu \leq uv$). In other words, we don't have $uv \geq vu$.

From $n\ell\left(v\right) = m\ell\left(u\right)$, we obtain $m\ell\left(u\right) = n\ell\left(v\right)$. Hence, Exercise 6.1.11 (applied to n and m instead of m and n) shows that $uv \geq vu$ holds if and only if $u^m \geq v^n$ holds. Therefore, we don't have $u^m \geq v^n$ (since we don't have $uv \geq vu$). Thus, we have $u^m < v^n$ (since the lexicographic order on $\mathfrak{A}^*$ is a total order). Hence, the word u^m is not a prefix of v^n [1196].

But we have $u^m \leq v^n$ (since $u^m < v^n$). In other words,

> **either** there exists an $i \in \left\{1, 2, \ldots, \min\left\{\ell\left(u^m\right), \ell\left(v^n\right)\right\}\right\}$
>
> such that $\left(\left(u^m\right)_i < \left(v^n\right)_i, \text{ and every } j \in \left\{1, 2, \ldots, i-1\right\} \text{ satisfies } \left(u^m\right)_j = \left(v^n\right)_j\right)$,
>
> **or** the word u^m is a prefix of v^n

(by the definition of the lexicographic order). Thus, there exists an $i \in \left\{1, 2, \ldots, \min\left\{\ell\left(u^m\right), \ell\left(v^n\right)\right\}\right\}$ such that

$$\left(\left(u^m\right)_i < \left(v^n\right)_i, \text{ and every } j \in \left\{1, 2, \ldots, i-1\right\} \text{ satisfies } \left(u^m\right)_j = \left(v^n\right)_j\right)$$

(since the word u^m is not a prefix of v^n). Consider this i.

We have $i \in \left\{1, 2, \ldots, \min\left\{\ell\left(u^m\right), \ell\left(v^n\right)\right\}\right\} = \left\{1, 2, \ldots, g\right\}$ (since $\min\left\{\underbrace{\ell\left(u^m\right)}_{=g}, \underbrace{\ell\left(v^n\right)}_{=g}\right\} = \min\left\{g, g\right\} = g$) and $\left(u^m\right)_i < \left(v^n\right)_i$. Moreover, every $j \in \left\{1, 2, \ldots, i-1\right\}$ satisfies $\left(u^m\right)_j = \left(v^n\right)_j$. Hence, there exists a $k \in \left\{1, 2, \ldots, g\right\}$ such that $\left(u^m\right)_k < \left(v^n\right)_k$, and such that every $j \in \left\{1, 2, \ldots, k-1\right\}$ satisfies $\left(u^m\right)_j = \left(v^n\right)_j$ (namely, $k = i$). This proves Lemma 13.190.10. □

Lemma 13.190.11. *Let $u, v \in \mathfrak{A}^*$ be two aperiodic words such that $u \neq v$. Let $g = \ell\left(u\right) \cdot \ell\left(v\right)$. Then:*

(a) *There exists some $i \in \left\{0, 1, \ldots, g-1\right\}$ satisfying $\left(c^i \cdot u\right)_1 \neq \left(c^i \cdot v\right)_1$.*

(b) *If $u \leq_\omega v$, then the smallest $i \in \left\{0, 1, \ldots, g-1\right\}$ satisfying $\left(c^i \cdot u\right)_1 \neq \left(c^i \cdot v\right)_1$ satisfies $\left(c^i \cdot u\right)_1 < \left(c^i \cdot v\right)_1$.*

(c) *If $v \leq_\omega u$, then the smallest $i \in \left\{0, 1, \ldots, g-1\right\}$ satisfying $\left(c^i \cdot u\right)_1 \neq \left(c^i \cdot v\right)_1$ satisfies $\left(c^i \cdot u\right)_1 > \left(c^i \cdot v\right)_1$.*

Proof of Lemma 13.190.11. The words u and v are aperiodic and thus nonempty (since any aperiodic word is nonempty). Let $n = \ell\left(u\right)$ and $m = \ell\left(v\right)$. Then, $n = \ell\left(u\right) > 0$ (since u is nonempty), so that n is a positive integer. Likewise, m is a positive integer. Moreover, combining the equalities $\underbrace{n}_{=\ell(u)} \ell\left(v\right) = \ell\left(u\right) \cdot \ell\left(v\right) = g$ and $\underbrace{m}_{=\ell(v)} \ell\left(u\right) = \ell\left(v\right) \cdot \ell\left(u\right) = \ell\left(u\right) \cdot \ell\left(v\right) = g$, we obtain $g = n\ell\left(v\right) = m\ell\left(u\right)$. Also, $g = \underbrace{\ell\left(u\right)}_{=n} \cdot \underbrace{\ell\left(v\right)}_{=m} = nm$; this shows that g is a positive integer (since n and m are positive integers). Note also that $v \neq u$ (since $u \neq v$) and $g = \ell\left(u\right) \cdot \ell\left(v\right) = \ell\left(v\right) \cdot \ell\left(u\right)$. Thus, u and v play symmetric roles in our situation.

The words u and v are aperiodic; i.e., we have $u, v \in \mathfrak{A}^{\mathfrak{a}}$ (since $\mathfrak{A}^{\mathfrak{a}}$ is the set of all aperiodic words).

We shall now prove the following fact:

> *Claim 1:* Assume that $u \leq_\omega v$. Then, there exists some $i \in \left\{0, 1, \ldots, g-1\right\}$ satisfying $\left(c^i \cdot u\right)_1 \neq \left(c^i \cdot v\right)_1$.

[*Proof of Claim 1:* Lemma 13.190.10 shows that there exists a $k \in \left\{1, 2, \ldots, g\right\}$ such that $\left(u^m\right)_k < \left(v^n\right)_k$, and such that every $j \in \left\{1, 2, \ldots, k-1\right\}$ satisfies $\left(u^m\right)_j = \left(v^n\right)_j$. Consider this k. But $k \in \left\{1, 2, \ldots, g\right\}$, thus

[1196] *Proof.* Assume the contrary. Thus, the word u^m is a prefix of v^n. Hence, $u^m = v^n$ (since the words u^m and v^n have the same length). This contradicts $u^m < v^n$. This contradiction shows that our assumption was false, qed.

$k-1 \in \{0,1,\ldots,g-1\} = \{0,1,\ldots,m\ell(u)-1\}$ (since $g = m\ell(u)$). Hence, Lemma 13.190.9 (applied to u and $k-1$ instead of w and i) yields $\left(c^{k-1}\cdot u\right)_1 = (u^m)_{(k-1)+1} = (u^m)_k$ (since $(k-1)+1 = k$).

Also, $k-1 \in \{0,1,\ldots,g-1\} = \{0,1,\ldots,n\ell(v)-1\}$ (since $g = n\ell(v)$). Hence, Lemma 13.190.9 (applied to v, n and $k-1$ instead of w, m and i) yields $\left(c^{k-1}\cdot v\right)_1 = (v^n)_{(k-1)+1} = (v^n)_k$ (since $(k-1)+1 = k$).

Now, recall that $(u^m)_k < (v^n)_k$. In view of $\left(c^{k-1}\cdot u\right)_1 = (u^m)_k$ and $\left(c^{k-1}\cdot v\right)_1 = (v^n)_k$, we can rewrite this as $\left(c^{k-1}\cdot u\right)_1 < \left(c^{k-1}\cdot v\right)_1$. Hence, $\left(c^{k-1}\cdot u\right)_1 \neq \left(c^{k-1}\cdot v\right)_1$. Since $k-1 \in \{0,1,\ldots,g-1\}$, this shows that there exists some $i \in \{0,1,\ldots,g-1\}$ satisfying $\left(c^{i}\cdot u\right)_1 \neq \left(c^{i}\cdot v\right)_1$ (namely, $i = k-1$). This proves Claim 1.]

We can now easily obtain the following counterpart of Claim 1 for the case when $v \leq_\omega u$:

> *Claim 2:* Assume that $v \leq_\omega u$. Then, there exists some $i \in \{0,1,\ldots,g-1\}$ satisfying $\left(c^{i}\cdot u\right)_1 \neq \left(c^{i}\cdot v\right)_1$.

[*Proof of Claim 2:* We have $v \neq u$ and $g = \ell(v)\cdot\ell(u)$. Hence, Claim 1 (applied to v and u instead of u and v) yields that there exists some $i \in \{0,1,\ldots,g-1\}$ satisfying $\left(c^{i}\cdot v\right)_1 \neq \left(c^{i}\cdot u\right)_1$. In other words, there exists some $i \in \{0,1,\ldots,g-1\}$ satisfying $\left(c^{i}\cdot u\right)_1 \neq \left(c^{i}\cdot v\right)_1$. This proves Claim 2.]

(a) Proposition 6.6.19 shows that the relation $\leq_\omega$ on the set $\mathfrak{A}^{\mathfrak{a}}$ is the smaller-or-equal relation of a total order. Thus, we have $u \leq_\omega v$ or $v \leq_\omega u$ (since $u, v \in \mathfrak{A}^{\mathfrak{a}}$). In each of these two cases, we can conclude that there exists some $i \in \{0,1,\ldots,g-1\}$ satisfying $\left(c^{i}\cdot u\right)_1 \neq \left(c^{i}\cdot v\right)_1$ (indeed, in the case $u \leq_\omega v$, this follows from Claim 1, while in the case $v \leq_\omega u$, this follows from Claim 2). This proves Lemma 13.190.11(a).

(b) Assume that $u \leq_\omega v$. Thus, Lemma 13.190.10 shows that there exists a $k \in \{1,2,\ldots,g\}$ such that $(u^m)_k < (v^n)_k$, and such that every $j \in \{1,2,\ldots,k-1\}$ satisfies $(u^m)_j = (v^n)_j$. Consider this k. We have $(u^m)_k < (v^n)_k$. This rewrites as $(u^m)_{(k-1)+1} < (v^n)_{(k-1)+1}$ (since $(k-1)+1 = k$).

It is easy to see the following:

> *Claim 3:* The number $k-1$ is the smallest $i \in \{0,1,\ldots,g-1\}$ satisfying $(u^m)_{i+1} \neq (v^n)_{i+1}$.

[*Proof of Claim 3:* The number $k-1$ is an element of $\{0,1,\ldots,g-1\}$ (since $k \in \{1,2,\ldots,g\}$) and satisfies $(u^m)_{(k-1)+1} \neq (v^n)_{(k-1)+1}$ (since $(u^m)_{(k-1)+1} < (v^n)_{(k-1)+1}$). In other words, the number $k-1$ is an $i \in \{0,1,\ldots,g-1\}$ satisfying $(u^m)_{i+1} \neq (v^n)_{i+1}$. It remains to show that $k-1$ is the **smallest** such i.

Indeed, let $i \in \{0,1,\ldots,g-1\}$ be such that $(u^m)_{i+1} \neq (v^n)_{i+1}$. We shall show that $i \geq k-1$.

Indeed, assume the contrary. Hence, $i < k-1$. Thus, $i+1 < k$, so that $i+1 \leq k-1$ (since $i+1$ and k are integers). Combining this with $i+1 > i \geq 0$ (since $i \in \{0,1,\ldots,g-1\}$), we obtain $i+1 \in \{1,2,\ldots,k-1\}$. But recall that every $j \in \{1,2,\ldots,k-1\}$ satisfies $(u^m)_j = (v^n)_j$. Applying this to $j = i+1$, we obtain $(u^m)_{i+1} = (v^n)_{i+1}$ (since $i+1 \in \{1,2,\ldots,k-1\}$). This contradicts $(u^m)_{i+1} \neq (v^n)_{i+1}$. This contradiction shows that our assumption was false. Hence, $i \geq k-1$ is proved.

Now, forget that we fixed i. We thus have shown that $i \geq k-1$ for each $i \in \{0,1,\ldots,g-1\}$ such that $(u^m)_{i+1} \neq (v^n)_{i+1}$. Thus, $k-1$ is the **smallest** $i \in \{0,1,\ldots,g-1\}$ satisfying $(u^m)_{i+1} \neq (v^n)_{i+1}$ (since we already know that $k-1$ is such an i). This proves Claim 3.]

From Claim 3, we quickly obtain the following:

> *Claim 4:* The smallest $i \in \{0,1,\ldots,g-1\}$ satisfying $(u^m)_{i+1} \neq (v^n)_{i+1}$ satisfies $(u^m)_{i+1} < (v^n)_{i+1}$.

[*Proof of Claim 4:* We must show that the smallest $i \in \{0,1,\ldots,g-1\}$ satisfying $(u^m)_{i+1} \neq (v^n)_{i+1}$ satisfies $(u^m)_{i+1} < (v^n)_{i+1}$. But we know (from Claim 3) that this smallest i is $k-1$. Hence, we need to prove that $i = k-1$ satisfies $(u^m)_{i+1} < (v^n)_{i+1}$. In other words, we need to prove that $(u^m)_{(k-1)+1} < (v^n)_{(k-1)+1}$. But we have proven this already. Thus, Claim 4 is proved.]

On the other hand, each $i \in \{0,1,\ldots,g-1\}$ satisfies

$$(u^m)_{i+1} = \left(c^{i}\cdot u\right)_1 . \tag{13.190.2}$$

[*Proof of (13.190.2):* Let $i \in \{0,1,\ldots,g-1\}$. Then, $i \in \{0,1,\ldots,g-1\} = \{0,1,\ldots,m\ell(u)-1\}$ (since $g = m\ell(u)$). Hence, Lemma 13.190.9 (applied to $w = u$) yields $\left(c^{i}\cdot u\right)_1 = (u^m)_{i+1}$. This proves (13.190.2).]

Furthermore, each $i \in \{0,1,\ldots,g-1\}$ satisfies

$$(v^n)_{i+1} = \left(c^{i}\cdot v\right)_1 . \tag{13.190.3}$$

[*Proof of (13.190.3):* The proof of (13.190.3) proceeds in the same way as the proof of (13.190.2), but using v and n instead of u and m.]

Using the equalities (13.190.2) and (13.190.3), we can rewrite Claim 4 as follows:

Claim 5: The smallest $i \in \{0, 1, \ldots, g-1\}$ satisfying $\left(c^i \cdot u\right)_1 \neq \left(c^i \cdot v\right)_1$ satisfies $\left(c^i \cdot u\right)_1 < \left(c^i \cdot v\right)_1$.

But Claim 5 is precisely the statement of Lemma 13.190.11(b). Thus, Lemma 13.190.11(b) is proven.

(c) Assume that $v \leq_\omega u$. Thus, Lemma 13.190.11(b) (applied to v and u instead of u and v) yields the following:

Claim 6: The smallest $i \in \{0, 1, \ldots, g-1\}$ satisfying $\left(c^i \cdot v\right)_1 \neq \left(c^i \cdot u\right)_1$ satisfies $\left(c^i \cdot v\right)_1 < \left(c^i \cdot u\right)_1$.

In other words, we have the following:

Claim 7: The smallest $i \in \{0, 1, \ldots, g-1\}$ satisfying $\left(c^i \cdot u\right)_1 \neq \left(c^i \cdot v\right)_1$ satisfies $\left(c^i \cdot u\right)_1 > \left(c^i \cdot v\right)_1$.

(Indeed, Claim 7 is a restatement of Claim 6, since the statement "$\left(c^i \cdot u\right)_1 \neq \left(c^i \cdot v\right)_1$" is equivalent to "$\left(c^i \cdot v\right)_1 \neq \left(c^i \cdot u\right)_1$", whereas the statement "$\left(c^i \cdot u\right)_1 > \left(c^i \cdot v\right)_1$" is equivalent to "$\left(c^i \cdot v\right)_1 < \left(c^i \cdot u\right)_1$".)

But Claim 7 is precisely the statement of Lemma 13.190.11(c). Thus, Lemma 13.190.11(c) is proven. □

Lemma 13.190.12. *Let $a, b \in \mathfrak{A}$ be two letters. Let $p, q \in \mathfrak{A}^*$ be two words such that $\ell(p) = \ell(q)$. Then, we have $ap \leq bq$ if and only if either $a < b$ or ($a = b$ and $pa \leq qb$).*

Proof of Lemma 13.190.12. Recall that $a \in \mathfrak{A}$; hence, a is identified with the one-letter word (a). Thus, $\ell(a) = 1$. Similarly, $\ell(b) = 1$. Hence, $\ell(a) = 1 = \ell(b)$, so that $\ell(a) \leq \ell(b)$.

We shall next prove the following:

Claim 1: If $ap \leq bq$, then we have either $a < b$ or ($a = b$ and $pa \leq qb$).

[*Proof of Claim 1:* Assume that $ap \leq bq$. We must prove that we have either $a < b$ or ($a = b$ and $pa \leq qb$). If $a < b$, then this is obviously true. Thus, for the rest of this proof of Claim 1, we can WLOG assume that we don't have $a < b$. Assume this.

We don't have $a < b$. Hence, we have $a \geq b$ (since the order on $\mathfrak{A}$ is a total order).

But Proposition 6.1.2(f) (applied to p, b and q instead of b, c and d) yields $a \leq b$ (since $ap \leq bq$ and $\ell(a) \leq \ell(b)$). Combining this with $a \geq b$, we obtain $a = b$. Thus, $ap = bp$, so that $bp = ap \leq bq$. Hence, Proposition 6.1.2(c) (applied to b, p and q instead of a, c and d) yields $p \leq q$. Therefore, Proposition 6.1.2(j) (applied to p, q and b instead of a, b and c) yields $pb \leq qb$ (since $\ell(p) \geq \ell(q)$ (because $\ell(p) = \ell(q)$)). But $a = b$, so that $pa = pb \leq qb$. Hence, we have shown that $a = b$ and $pa \leq qb$. Thus, we have either $a < b$ or ($a = b$ and $pa \leq qb$). This proves Claim 1.]

Claim 2: If $a < b$, then $ap \leq bq$.

[*Proof of Claim 2:* Assume that $a < b$. If a was a prefix of b, then we would have $a = b$ (since a and b are one-letter words), which would contradict $a < b$. Thus, a is not a prefix of b.

But $a \leq b$ (since $a < b$). Hence, Proposition 6.1.2(d) (applied to p, b and q instead of b, c and d) yields that either we have $ap \leq bq$ or the word a is a prefix of b. Since the word a is not a prefix of b, we thus conclude that $ap \leq bq$. This proves Claim 2.]

Claim 3: If $a = b$ and $pa \leq qb$, then $ap \leq bq$.

[*Proof of Claim 3:* Assume that $a = b$ and $pa \leq qb$. We must prove that $ap \leq bq$.

We have $\ell(p) \leq \ell(q)$ (since $\ell(p) = \ell(q)$) and $pa \leq qb$. Thus, Proposition 6.1.2(f) (applied to p, a, q and b instead of a, b, c and d) yields $p \leq q$. Hence, Proposition 6.1.2(b) (applied to p and q instead of c and d) yields $ap \leq aq = bq$ (since $a = b$). This proves Claim 3.]

Claim 4: If we have either $a < b$ or ($a = b$ and $pa \leq qb$), then we have $ap \leq bq$.

[*Proof of Claim 4:* This follows by combining Claim 2 and Claim 3.]

Combining Claim 1 with Claim 4, we conclude that we have $ap \leq bq$ if and only if either $a < b$ or ($a = b$ and $pa \leq qb$). (Indeed, the "only if" part of this statement follows from Claim 1, whereas the "if" part follows from Claim 4.) This proves Lemma 13.190.12. □

Proof of Proposition 6.6.20. (b) Assume that $u \neq v$. Let $g = \ell(u) \cdot \ell(v)$. Then, Lemma 13.190.11(a) yields that there exists some $i \in \{0, 1, \ldots, g-1\}$ satisfying $\left(c^i \cdot u\right)_1 \neq \left(c^i \cdot v\right)_1$. This i must satisfy $i \in$

$\{0,1,\ldots,g-1\} \subset \mathbb{N}$ and $\left(c^i \cdot u\right)_1 \neq \left(c^i \cdot v\right)_1$. Hence, there exists some $i \in \mathbb{N}$ satisfying $\left(c^i \cdot u\right)_1 \neq \left(c^i \cdot v\right)_1$. This proves Proposition 6.6.20(b).

(d) From $n\ell(u) = m\ell(v)$, we obtain $m\ell(v) = n\ell(u)$. Hence, Exercise 6.1.11 (applied to n, m, u and v instead of m, n, v and u) shows that $vu \geq uv$ holds if and only if $v^n \geq u^m$ holds. In other words, we have the logical equivalence $(vu \geq uv) \iff (v^m \geq u^n)$.

Now, we have the following chain of logical equivalences:

$$(u \leq_\omega v) \iff (uv \leq vu) \qquad \text{(by the definition of the relation } \leq_\omega\text{)}$$
$$\iff (vu \geq uv) \iff (v^m \geq u^n) \iff (u^n \leq v^m).$$

In other words, we have $u \leq_\omega v$ if and only if $u^n \leq v^m$. This proves Proposition 6.6.20(d).

(c) Our proof relies on the following five claims:

> *Claim 1:* If $u \leq_\omega v$, then the smallest $i \in \mathbb{N}$ satisfying $\left(c^i \cdot u\right)_1 \neq \left(c^i \cdot v\right)_1$ **either** does not exist **or** satisfies $\left(c^i \cdot u\right)_1 < \left(c^i \cdot v\right)_1$.

[*Proof of Claim 1:* Assume that $u \leq_\omega v$. We must prove that the smallest $i \in \mathbb{N}$ satisfying $\left(c^i \cdot u\right)_1 \neq \left(c^i \cdot v\right)_1$ **either** does not exist **or** satisfies $\left(c^i \cdot u\right)_1 < \left(c^i \cdot v\right)_1$.

If $u = v$, then this is obvious[1197]. Hence, for the rest of this proof of Claim 1, we WLOG assume that $u \neq v$. Let $g = \ell(u) \cdot \ell(v)$.

Lemma 13.190.11(a) yields that there exists some $i \in \{0,1,\ldots,g-1\}$ satisfying $\left(c^i \cdot u\right)_1 \neq \left(c^i \cdot v\right)_1$. Let j denote the **smallest** such i. Thus, $j \in \{0,1,\ldots,g-1\}$ and $\left(c^j \cdot u\right)_1 \neq \left(c^j \cdot v\right)_1$. From $j \in \{0,1,\ldots,g-1\}$, we obtain $j \leq g-1$; hence, $g-1 \geq j$.

Furthermore, Lemma 13.190.11(b) yields that the smallest $i \in \{0,1,\ldots,g-1\}$ satisfying $\left(c^i \cdot u\right)_1 \neq \left(c^i \cdot v\right)_1$ satisfies $\left(c^i \cdot u\right)_1 < \left(c^i \cdot v\right)_1$. Since we have denoted this smallest i by j, we can restate this as follows: The number $i = j$ satisfies $\left(c^i \cdot u\right)_1 < \left(c^i \cdot v\right)_1$. In other words, we have $\left(c^j \cdot u\right)_1 < \left(c^j \cdot v\right)_1$.

We have defined j to be the **smallest** $i \in \{0,1,\ldots,g-1\}$ satisfying $\left(c^i \cdot u\right)_1 \neq \left(c^i \cdot v\right)_1$. Thus, any $i \in \{0,1,\ldots,g-1\}$ satisfying $\left(c^i \cdot u\right)_1 \neq \left(c^i \cdot v\right)_1$ is greater or equal to j. In other words, for any $i \in \{0,1,\ldots,g-1\}$ satisfying $\left(c^i \cdot u\right)_1 \neq \left(c^i \cdot v\right)_1$, we have

$$i \geq j. \tag{13.190.4}$$

Now, recall that $j \in \{0,1,\ldots,g-1\} \subset \mathbb{N}$ and $\left(c^j \cdot u\right)_1 \neq \left(c^j \cdot v\right)_1$. In other words, j is an $i \in \mathbb{N}$ satisfying $\left(c^i \cdot u\right)_1 \neq \left(c^i \cdot v\right)_1$. Moreover, j is the **smallest** such i [1198].

So we know that j is the smallest $i \in \mathbb{N}$ satisfying $\left(c^i \cdot u\right)_1 \neq \left(c^i \cdot v\right)_1$. Thus, in particular, this smallest i exists. Moreover, this smallest i satisfies $\left(c^i \cdot u\right)_1 < \left(c^i \cdot v\right)_1$ (because this smallest i is j, but we know that $\left(c^j \cdot u\right)_1 < \left(c^j \cdot v\right)_1$). Thus, we have shown that the smallest $i \in \mathbb{N}$ satisfying $\left(c^i \cdot u\right)_1 \neq \left(c^i \cdot v\right)_1$ satisfies $\left(c^i \cdot u\right)_1 < \left(c^i \cdot v\right)_1$. This proves Claim 1.]

> *Claim 2:* If $v \leq_\omega u$, then the smallest $i \in \mathbb{N}$ satisfying $\left(c^i \cdot v\right)_1 \neq \left(c^i \cdot u\right)_1$ **either** does not exist **or** satisfies $\left(c^i \cdot v\right)_1 < \left(c^i \cdot u\right)_1$.

[*Proof of Claim 2:* Claim 2 is just Claim 1 with the roles of u and v swapped.]

> *Claim 3:* If $v \leq_\omega u$, then the smallest $i \in \mathbb{N}$ satisfying $\left(c^i \cdot u\right)_1 \neq \left(c^i \cdot v\right)_1$ **either** does not exist **or** satisfies $\left(c^i \cdot u\right)_1 > \left(c^i \cdot v\right)_1$.

[1197] Indeed, in this case, the smallest $i \in \mathbb{N}$ satisfying $\left(c^i \cdot u\right)_1 \neq \left(c^i \cdot v\right)_1$ does not exist, because $\left(c^i \cdot \underbrace{u}_{=v}\right)_1 = \left(c^i \cdot v\right)_1$ for each $i \in \mathbb{N}$.

[1198] *Proof.* We shall show that if $i \in \mathbb{N}$ satisfies $\left(c^i \cdot u\right)_1 \neq \left(c^i \cdot v\right)_1$, then $i \geq j$.

Indeed, let $i \in \mathbb{N}$ satisfy $\left(c^i \cdot u\right)_1 \neq \left(c^i \cdot v\right)_1$. We must prove that $i \geq j$. If $i \geq g-1$, then this is obvious (because in this case, we have $i \geq g-1 \geq j$). Hence, for the rest of this proof, we WLOG assume that $i < g-1$. Hence, $i \leq g-1$ and therefore $i \in \{0,1,\ldots,g-1\}$. Hence, (13.190.4) yields $i \geq j$.

Now, forget that we fixed i. We thus have shown that if $i \in \mathbb{N}$ satisfies $\left(c^i \cdot u\right)_1 \neq \left(c^i \cdot v\right)_1$, then $i \geq j$. In other words, any $i \in \mathbb{N}$ satisfying $\left(c^i \cdot u\right)_1 \neq \left(c^i \cdot v\right)_1$ must satisfy $i \geq j$. Therefore, j is the **smallest** $i \in \mathbb{N}$ satisfying $\left(c^i \cdot u\right)_1 \neq \left(c^i \cdot v\right)_1$ (because we already know that j is such an i).

[*Proof of Claim 3:* Claim 3 is just a restatement of Claim 2, since the statement "$\left(c^i \cdot u\right)_1 \neq \left(c^i \cdot v\right)_1$" is equivalent to "$\left(c^i \cdot u\right)_1 \neq \left(c^i \cdot v\right)_1$" and since the statement "$\left(c^i \cdot u\right)_1 > \left(c^i \cdot v\right)_1$" is equivalent to "$\left(c^i \cdot v\right)_1 < \left(c^i \cdot u\right)_1$".]

> *Claim 4:* If we don't have $u \leq_\omega v$, then the smallest $i \in \mathbb{N}$ satisfying $\left(c^i \cdot u\right)_1 \neq \left(c^i \cdot v\right)_1$ exists but does **not** satisfy $\left(c^i \cdot u\right)_1 < \left(c^i \cdot v\right)_1$.

[*Proof of Claim 4:* Assume that we don't have $u \leq_\omega v$. We must prove that the smallest $i \in \mathbb{N}$ satisfying $\left(c^i \cdot u\right)_1 \neq \left(c^i \cdot v\right)_1$ exists but does **not** satisfy $\left(c^i \cdot u\right)_1 < \left(c^i \cdot v\right)_1$.

Proposition 6.6.19 shows that the relation $\leq_\omega$ on the set $\mathfrak{A}^{\mathfrak{a}}$ is the smaller-or-equal relation of a total order. Hence, if we had $u = v$, then we would have $u \leq_\omega v$, which would contradict our assumption that we don't have $u \leq_\omega v$. Hence, we must have $u \neq v$.

Thus, Proposition 6.6.20(b) shows that there exists some $i \in \mathbb{N}$ satisfying $\left(c^i \cdot u\right)_1 \neq \left(c^i \cdot v\right)_1$. Hence, the **smallest** such i exists.

Recall that the relation $\leq_\omega$ on the set $\mathfrak{A}^{\mathfrak{a}}$ is the smaller-or-equal relation of a total order. Hence, we must have $v \leq_\omega u$ (since we don't have $u \leq_\omega v$). Thus, Claim 3 yields that the smallest $i \in \mathbb{N}$ satisfying $\left(c^i \cdot u\right)_1 \neq \left(c^i \cdot v\right)_1$ **either** does not exist **or** satisfies $\left(c^i \cdot u\right)_1 > \left(c^i \cdot v\right)_1$. Since we know that this smallest i exists (indeed, we have proved this in the previous paragraph), we thus conclude that the smallest $i \in \mathbb{N}$ satisfying $\left(c^i \cdot u\right)_1 \neq \left(c^i \cdot v\right)_1$ satisfies $\left(c^i \cdot u\right)_1 > \left(c^i \cdot v\right)_1$. Hence, this smallest i does **not** satisfy $\left(c^i \cdot u\right)_1 < \left(c^i \cdot v\right)_1$ (because $\left(c^i \cdot u\right)_1 < \left(c^i \cdot v\right)_1$ would contradict $\left(c^i \cdot u\right)_1 > \left(c^i \cdot v\right)_1$).

Altogether, we thus have shown that the smallest $i \in \mathbb{N}$ satisfying $\left(c^i \cdot u\right)_1 \neq \left(c^i \cdot v\right)_1$ exists but does **not** satisfy $\left(c^i \cdot u\right)_1 < \left(c^i \cdot v\right)_1$. This proves Claim 4.]

> *Claim 5:* If the smallest $i \in \mathbb{N}$ satisfying $\left(c^i \cdot u\right)_1 \neq \left(c^i \cdot v\right)_1$ **either** does not exist **or** satisfies $\left(c^i \cdot u\right)_1 < \left(c^i \cdot v\right)_1$, then we have $u \leq_\omega v$.

[*Proof of Claim 5:* Claim 5 is just the contrapositive of Claim 4, and thus holds (since Claim 4 holds).]

Now, Proposition 6.6.20(c) follows by combining Claim 1 with Claim 5. (Indeed, Claim 1 is the "only if" part of Proposition 6.6.20(c), whereas Claim 5 is the "if" part.)

(a) The words u and v are aperiodic and thus nonempty (since any aperiodic word is nonempty).

Let $n = \ell(v)$ and $m = \ell(u)$. Then, $n = \ell(v) > 0$ (since v is nonempty), so that n is a positive integer. Likewise, m is a positive integer. Hence, $m > 0$.

Let $g = nm$. Then, g is a positive integer (since n and m are positive integers). Hence, $g \geq 1$, so that $1 \in \{1, 2, \ldots, g\}$.

Moreover, combining the equalities $n \underbrace{\ell(u)}_{=m} = nm = g$ and $m \underbrace{\ell(v)}_{=n} = mn = nm = g$, we obtain $g = n\ell(u) = m\ell(v)$. Hence, Proposition 6.6.20(d) shows that we have $u \leq_\omega v$ if and only if $u^n \leq v^m$. In other words, we have the logical equivalence

$$(u \leq_\omega v) \iff (u^n \leq v^m). \tag{13.190.5}$$

The word u is aperiodic. Thus, Corollary 6.6.16 (applied to $w = u$) yields that the word $c \cdot u$ is aperiodic. Likewise, the word $c \cdot v$ is aperiodic. Moreover, $u \in \mathfrak{A}^m$ (since $\ell(u) = m$), so that $c \cdot u \in \mathfrak{A}^m$ and thus $\ell(c \cdot u) = m$. Likewise, $\ell(c \cdot v) = n$ (since $\ell(v) = n$). Furthermore, comparing $n \underbrace{\ell(c \cdot u)}_{=m} = nm$ with $m \underbrace{\ell(c \cdot v)}_{=n} = mn = nm$, we obtain $n\ell(c \cdot u) = m\ell(c \cdot v)$. Hence, Proposition 6.6.20(d) (applied to $c \cdot u$ and $c \cdot v$ instead of u and v) shows that we have $c \cdot u \leq_\omega c \cdot v$ if and only if $(c \cdot u)^n \leq (c \cdot v)^m$. In other words, we have the logical equivalence

$$(c \cdot u \leq_\omega c \cdot v) \iff ((c \cdot u)^n \leq (c \cdot v)^m). \tag{13.190.6}$$

Lemma 13.190.7 (applied to v and 1 instead of u and i) yields $\left(c^1 \cdot v\right)^m = c^1 \cdot (v^m)$. In view of $c^1 = c$, this rewrites as $(c \cdot v)^m = c \cdot (v^m)$. The same argument (with v and m replaced by u and n) yields $(c \cdot u)^n = c \cdot (u^n)$.

The word u^n has length $\ell(u^n) = n\ell(u) = g$, and thus can be written as $u^n = (u^n)_1 (u^n)_2 \cdots (u^n)_g$. Define a word $p \in \mathfrak{A}^*$ by $p = (u^n)_2 (u^n)_3 \cdots (u^n)_g$. Since $g \geq 1$, we thus have $p \in \mathfrak{A}^{g-1}$ (since $(u^n)_2, (u^n)_3, \ldots, (u^n)_g$ are single letters), so that $\ell(p) = g - 1$. Also, define a letter $a \in \mathfrak{A}$ by $a = (u^n)_1$. (This is well-defined, since

$1 \in \{1, 2, \ldots, g\}$.) Thus,

$$\underbrace{a}_{=(u^n)_1} \underbrace{p}_{=(u^n)_2 (u^n)_3 \cdots (u^n)_g} = (u^n)_1 \left((u^n)_2 (u^n)_3 \cdots (u^n)_g \right) = (u^n)_1 (u^n)_2 \cdots (u^n)_g$$

$$= u^n. \tag{13.190.7}$$

Lemma 13.147.4 (applied to g, a and p instead of m, u and v) yields $c(ap) = pa$. In view of $ap = u^n$, this rewrites as $c(u^n) = pa$. Hence,

$$(c \cdot u)^n = c \cdot (u^n) = c(u^n) = pa. \tag{13.190.8}$$

The word v^m has length $\ell(v^m) = m\ell(v) = g$, and thus can be written as $v^m = (v^m)_1 (v^m)_2 \cdots (v^m)_g$. Define a word $q \in \mathfrak{A}^*$ by $q = (v^m)_2 (v^m)_3 \cdots (v^m)_g$. Since $g \geq 1$, we thus have $q \in \mathfrak{A}^{g-1}$ (since $(v^m)_2, (v^m)_3, \ldots, (v^m)_g$ are single letters), so that $\ell(q) = g - 1$. Also, define a letter $b \in \mathfrak{A}$ by $b = (v^m)_1$. (This is well-defined, since $1 \in \{1, 2, \ldots, g\}$.) Thus,

$$\underbrace{b}_{=(v^m)_1} \underbrace{q}_{=(v^m)_2 (v^m)_3 \cdots (v^m)_g} = (v^m)_1 \left((v^m)_2 (v^m)_3 \cdots (v^m)_g \right) = (v^m)_1 (v^m)_2 \cdots (v^m)_g$$

$$= v^m. \tag{13.190.9}$$

Lemma 13.147.4 (applied to g, b and q instead of m, u and v) yields $c(bq) = qb$. In view of $bq = v^m$, this rewrites as $c(v^m) = qb$. Hence,

$$(c \cdot v)^m = c \cdot (v^m) = c(v^m) = qb. \tag{13.190.10}$$

Comparing $\ell(p) = g - 1$ with $\ell(q) = g - 1$, we obtain $\ell(p) = \ell(q)$. Thus, Lemma 13.190.12 yields that we have $ap \leq bq$ if and only if either $a < b$ or ($a = b$ and $pa \leq qb$). In other words, we have the following equivalence:

$$(ap \leq bq) \iff (\text{either } a < b \text{ or } (a = b \text{ and } pa \leq qb)). \tag{13.190.11}$$

The word u^n starts with the word u (since n is a positive integer), and thus has the same first letter as the word u (since the word u is nonempty). In other words, $(u^n)_1 = u_1$. Hence, $a = (u^n)_1 = u_1$. The same argument (applied to v, m and b instead of u, n and a) yields $b = v_1$.

Now, we have the following chain of logical equivalences:

$$\begin{aligned}
(u \leq_\omega v) &\iff \left(\underbrace{u^n}_{\substack{=ap \\ (\text{by } (13.190.7))}} \leq \underbrace{v^m}_{\substack{=bq \\ (\text{by } (13.190.9))}} \right) \qquad (\text{by } (13.190.5)) \\
&\iff (ap \leq bq) \\
&\iff \left(\text{either } \underbrace{a}_{=u_1} < \underbrace{b}_{=v_1} \text{ or } \left(\underbrace{a}_{=u_1} = \underbrace{b}_{=v_1} \text{ and } \underbrace{pa}_{\substack{=(c \cdot u)^n \\ (\text{by } (13.190.8))}} \leq \underbrace{qb}_{\substack{=(c \cdot v)^m \\ (\text{by } (13.190.10))}} \right) \right) \\
&\qquad (\text{by } (13.190.11)) \\
&\iff \left(\text{either } u_1 < v_1 \text{ or } \left(u_1 = v_1 \text{ and } \underbrace{(c \cdot u)^n \leq (c \cdot v)^m}_{\substack{\iff (c \cdot u \leq_\omega c \cdot v) \\ (\text{by } (13.190.6))}} \right) \right) \\
&\iff (\text{either } u_1 < v_1 \text{ or } (u_1 = v_1 \text{ and } c \cdot u \leq_\omega c \cdot v)).
\end{aligned}$$

In other words, we have $u \leq_\omega v$ if and only if either $u_1 < v_1$ or ($u_1 = v_1$ and $c \cdot u \leq_\omega c \cdot v$). This proves Proposition 6.6.20(a). □

Finally, let us prove Proposition 6.6.22:

Proof of Proposition 6.6.22. We have $w = (w_1, w_2, \ldots, w_n)$ (since $w \in \mathfrak{A}^n$).

(a) Let $h \in \{1, 2, \ldots, n\}$. Let z be the cycle of τ that contains h. Thus, $h \in z$. Hence, Proposition 6.6.7(a) yields that $[w_{\tau,h}] = \{w_{\tau,i} \mid i \in z\}$. Moreover, Proposition 6.6.7(d) shows that the set $\{w_{\tau,i} \mid i \in z\}$ is an aperiodic necklace. In other words, the set $[w_{\tau,h}]$ is an aperiodic necklace (since $[w_{\tau,h}] = \{w_{\tau,i} \mid i \in z\}$).

But Proposition 6.6.5(a) shows that the word $w_{\tau,h}$ is nonempty and has length $\operatorname{ord}_\tau(h)$. Hence, Proposition 6.6.15 (applied to $w_{\tau,h}$ instead of w) shows that the word $w_{\tau,h}$ is aperiodic if and only if the necklace $[w_{\tau,h}]$ is aperiodic. Hence, the word $w_{\tau,h}$ is aperiodic (since the necklace $[w_{\tau,h}]$ is aperiodic).

Forget that we fixed h. We thus have proved that the word $w_{\tau,h}$ is aperiodic for each $h \in \{1, 2, \ldots, n\}$. In other words, the words $w_{\tau,1}, w_{\tau,2}, \ldots, w_{\tau,n}$ are aperiodic. This proves Proposition 6.6.22(a).

(b) Proposition 6.6.22(a) shows that the words $w_{\tau,1}, w_{\tau,2}, \ldots, w_{\tau,n}$ are aperiodic. Thus, these words belong to $\mathfrak{A}^{\mathfrak{a}}$ (since $\mathfrak{A}^{\mathfrak{a}}$ is the set of all aperiodic words). Hence, the chain of inequalities $w_{\tau,1} \leq_\omega w_{\tau,2} \leq_\omega \cdots \leq_\omega w_{\tau,n}$ makes sense. It remains to prove that it holds.

Let α and β be two elements of $\{1, 2, \ldots, n\}$ such that $\alpha < \beta$. We shall show that $w_{\tau,\alpha} \leq_\omega w_{\tau,\beta}$.

Indeed, assume the contrary. Thus, it is **not** true that $w_{\tau,\alpha} \leq_\omega w_{\tau,\beta}$.

Let us notice that each $i \in \mathbb{N}$ satisfies

$$\left(c^i \cdot w_{\tau,\alpha}\right)_1 = w_{\tau^{i+1}(\alpha)} \qquad (13.190.12)$$

and

$$\left(c^i \cdot w_{\tau,\beta}\right)_1 = w_{\tau^{i+1}(\beta)} \qquad (13.190.13)$$

[*Proof of (13.190.12) and (13.190.13):* Let $i \in \mathbb{N}$. Then, Proposition 6.6.5(b) (applied to $h = \tau^i(\alpha)$) yields that the first letter of the word $w_{\tau,\tau^i(\alpha)}$ is $w_{\tau(\tau^i(\alpha))}$.

But Proposition 6.6.5(e) (applied to $h = \alpha$) yields $w_{\tau,\tau^i(\alpha)} = c^i \cdot w_{\tau,\alpha}$. Hence, $\left(w_{\tau,\tau^i(\alpha)}\right)_1 = \left(c^i \cdot w_{\tau,\alpha}\right)_1$. Thus,

$$\begin{aligned}\left(c^i \cdot w_{\tau,\alpha}\right)_1 &= \left(w_{\tau,\tau^i(\alpha)}\right)_1 = \left(\text{the first letter of the word } w_{\tau,\tau^i(\alpha)}\right) = w_{\tau(\tau^i(\alpha))} \\ &\qquad \left(\text{since the first letter of the word } w_{\tau,\tau^i(\alpha)} \text{ is } w_{\tau(\tau^i(\alpha))}\right) \\ &= w_{\tau^{i+1}(\alpha)} \qquad \left(\text{since } \tau\left(\tau^i(\alpha)\right) = \tau^{i+1}(\alpha)\right).\end{aligned}$$

This proves (13.190.12). The same argument (but applied to β instead of α) proves (13.190.13).]

Proposition 6.6.22(a) shows that the words $w_{\tau,1}, w_{\tau,2}, \ldots, w_{\tau,n}$ are aperiodic. Hence, in particular, the words $w_{\tau,\alpha}$ and $w_{\tau,\beta}$ are aperiodic. Thus, Proposition 6.6.20(c) (applied to $u = w_{\tau,\alpha}$ and $v = w_{\tau,\beta}$) yields that we have $w_{\tau,\alpha} \leq_\omega w_{\tau,\beta}$ if and only if the smallest $i \in \mathbb{N}$ satisfying $\left(c^i \cdot w_{\tau,\alpha}\right)_1 \neq \left(c^i \cdot w_{\tau,\beta}\right)_1$ **either** does not exist **or** satisfies $\left(c^i \cdot w_{\tau,\alpha}\right)_1 < \left(c^i \cdot w_{\tau,\beta}\right)_1$. Thus, it is **not** true that the smallest $i \in \mathbb{N}$ satisfying $\left(c^i \cdot w_{\tau,\alpha}\right)_1 \neq \left(c^i \cdot w_{\tau,\beta}\right)_1$ **either** does not exist **or** satisfies $\left(c^i \cdot w_{\tau,\alpha}\right)_1 < \left(c^i \cdot w_{\tau,\beta}\right)_1$ (because it is **not** true that $w_{\tau,\alpha} \leq_\omega w_{\tau,\beta}$). In other words, the smallest $i \in \mathbb{N}$ satisfying $\left(c^i \cdot w_{\tau,\alpha}\right)_1 \neq \left(c^i \cdot w_{\tau,\beta}\right)_1$ exists but does **not** satisfy $\left(c^i \cdot w_{\tau,\alpha}\right)_1 < \left(c^i \cdot w_{\tau,\beta}\right)_1$. In view of (13.190.12) and (13.190.13), we can rewrite this fact as follows: The smallest $i \in \mathbb{N}$ satisfying $w_{\tau^{i+1}(\alpha)} \neq w_{\tau^{i+1}(\beta)}$ exists but does **not** satisfy $w_{\tau^{i+1}(\alpha)} < w_{\tau^{i+1}(\beta)}$.

Consider this i, and denote it by j. Thus, $i = j$ does **not** satisfy $w_{\tau^{i+1}(\alpha)} < w_{\tau^{i+1}(\beta)}$. In other words, we do **not** have $w_{\tau^{j+1}(\alpha)} < w_{\tau^{j+1}(\beta)}$. In other words, we have $w_{\tau^{j+1}(\alpha)} \geq w_{\tau^{j+1}(\beta)}$.

We have defined j to be the smallest $i \in \mathbb{N}$ satisfying $w_{\tau^{i+1}(\alpha)} \neq w_{\tau^{i+1}(\beta)}$. Hence, j is an $i \in \mathbb{N}$ satisfying $w_{\tau^{i+1}(\alpha)} \neq w_{\tau^{i+1}(\beta)}$. In other words, j is an element of $\mathbb{N}$ and satisfies $w_{\tau^{j+1}(\alpha)} \neq w_{\tau^{j+1}(\beta)}$. Combining $w_{\tau^{j+1}(\alpha)} \geq w_{\tau^{j+1}(\beta)}$ with $w_{\tau^{j+1}(\alpha)} \neq w_{\tau^{j+1}(\beta)}$, we obtain

$$w_{\tau^{j+1}(\alpha)} > w_{\tau^{j+1}(\beta)}. \qquad (13.190.14)$$

On the other hand, j is the **smallest** $i \in \mathbb{N}$ satisfying $w_{\tau^{i+1}(\alpha)} \neq w_{\tau^{i+1}(\beta)}$. Thus, every such $i \in \mathbb{N}$ is $\geq j$. In other words,

$$\text{if } i \in \mathbb{N} \text{ satisfies } w_{\tau^{i+1}(\alpha)} \neq w_{\tau^{i+1}(\beta)}, \text{ then } i \geq j. \qquad (13.190.15)$$

Hence,

$$\text{every } i \in \{0, 1, \ldots, j-1\} \text{ satisfies } w_{\tau^{i+1}(\alpha)} = w_{\tau^{i+1}(\beta)}. \qquad (13.190.16)$$

[*Proof of (13.190.16):* Let $i \in \{0, 1, \ldots, j-1\}$. Thus, $i \geq 0$ and $i \leq j - 1 < j$. If we had $w_{\tau^{i+1}(\alpha)} \neq w_{\tau^{i+1}(\beta)}$, then we would have $i \geq j$ (by (13.190.15)), which would contradict $i < j$. Thus, we cannot have $w_{\tau^{i+1}(\alpha)} \neq w_{\tau^{i+1}(\beta)}$. Hence, we must have $w_{\tau^{i+1}(\alpha)} = w_{\tau^{i+1}(\beta)}$. This proves (13.190.16).]

Thus, Lemma 6.6.6(h) yields $w_{\tau^{j+1}(\alpha)} \leq w_{\tau^{j+1}(\beta)}$. This contradicts (13.190.14). This contradiction shows that our assumption was wrong. Hence, $w_{\tau,\alpha} \leq_\omega w_{\tau,\beta}$ is proven.

Now, forget that we fixed α and β. We thus have shown that if α and β are two elements of $\{1, 2, \ldots, n\}$ such that $\alpha < \beta$, then $w_{\tau,\alpha} \leq_\omega w_{\tau,\beta}$. In other words, we have $w_{\tau,1} \leq_\omega w_{\tau,2} \leq_\omega \cdots \leq_\omega w_{\tau,n}$. This proves Proposition 6.6.22(b). □

We have now proven Proposition 6.6.15, Corollary 6.6.16, Corollary 6.6.17, Proposition 6.6.19, Proposition 6.6.20 and Proposition 6.6.22. Thus, Exercise 6.6.23 is solved.

13.191. **Solution to Exercise 6.6.30.** *Solution to Exercise 6.6.30.* Let us first show a simple lemma about multisets of necklaces:

Lemma 13.191.1. *Let M be a finite multiset of necklaces. Let $M' = \biguplus_{N \in M} N$. (We are here using the fact that each necklace $N \in M$ is a set, thus a multiset.)*

Let $u \in \mathfrak{A}^*$ be a nonempty word. Then,

$$(\textit{multiplicity of } u \textit{ in } M') = (\textit{multiplicity of } [u] \textit{ in } M).$$

Proof of Lemma 13.191.1. We note the following simple fact:

> *Claim 1:* Let N be a necklace. Then, the statement $u \in N$ is equivalent to the statement $N = [u]$.

[*Proof of Claim 1:* The implication $(u \in N) \Longrightarrow (N = [u])$ follows from Lemma 13.190.2. The converse implication $(N = [u]) \Longrightarrow (u \in N)$ follows from Lemma 13.190.1. Combining these two implications, we obtain the equivalence $(u \in N) \Longleftrightarrow (N = [u])$. Thus, Claim 1 is proven.]

Let us write the finite multiset M in the form $M = \{N_1, N_2, \ldots, N_k\}_{\text{multiset}}$, where $N_1, N_2, \ldots, N_k$ are necklaces. Thus,

$$\begin{aligned} &(\text{multiplicity of } [u] \text{ in } M) \\ &= (\text{the number of all } i \in \{1, 2, \ldots, k\} \text{ such that } N_i = [u]) \end{aligned} \tag{13.191.1}$$

and

$$\biguplus_{N \in M} N = N_1 \uplus N_2 \uplus \cdots \uplus N_k$$

(where we are using the notation $M_1 \uplus M_2 \uplus \cdots \uplus M_k$ for a multiset union $\biguplus_{s \in \{1,2,\ldots,k\}} M_s$). Hence,

$$M' = \biguplus_{N \in M} N = N_1 \uplus N_2 \uplus \cdots \uplus N_k,$$

so that

$$\begin{aligned} &(\text{multiplicity of } u \text{ in } M') \\ &= (\text{multiplicity of } u \text{ in } N_1 \uplus N_2 \uplus \cdots \uplus N_k) \\ &= \sum_{i=1}^{k} \underbrace{(\text{multiplicity of } u \text{ in } N_i)}_{\substack{= \begin{cases} 1, & \text{if } u \in N_i; \\ 0, & \text{if } u \notin N_i \end{cases} \\ \text{(since } N_i \text{ is a set (because any necklace is a set))}}} = \sum_{i=1}^{k} \begin{cases} 1, & \text{if } u \in N_i; \\ 0, & \text{if } u \notin N_i \end{cases} \\ &= (\text{the number of all } i \in \{1, 2, \ldots, k\} \text{ such that } u \in N_i) \\ &= (\text{the number of all } i \in \{1, 2, \ldots, k\} \text{ such that } N_i = [u]) \\ &\qquad \left(\begin{array}{c} \text{because for any } i \in \{1, 2, \ldots, k\}, \text{ the statement } u \in N_i \text{ is equivalent} \\ \text{to the statement } N_i = [u] \text{ (by Claim 1, applied to } N = N_i) \end{array}\right) \\ &= (\text{multiplicity of } [u] \text{ in } M) \qquad (\text{by } (13.191.1)). \end{aligned}$$

This proves Lemma 13.191.1. □

We can now prove one "half" of Theorem 6.6.29:

Lemma 13.191.2. *We have* $\operatorname{RG} \circ \operatorname{GR} = \operatorname{id}$.

Proof of Lemma 13.191.2. Let $w \in \mathfrak{A}^*$. Let $n = \ell(w)$; thus, $w \in \mathfrak{A}^n$ and $w = (w_1, w_2, \ldots, w_n)$. Let τ be the permutation $(\operatorname{std} w)^{-1} \in \mathfrak{S}_n$. Then, the definition of the map GR shows that

$$\operatorname{GR} w = \left\{[w]_z \mid z \text{ is a cycle of } \tau\right\}_{\text{multiset}}.$$

Let us denote this multiset $\operatorname{GR} w$ by M. Thus,

$$M = \operatorname{GR} w = \left\{[w]_z \mid z \text{ is a cycle of } \tau\right\}_{\text{multiset}}.$$

Also, $M = \operatorname{GR} w \in \mathfrak{M}\mathfrak{N}^{\mathfrak{a}}$ (as we have seen in Definition 6.6.12); in other words, M is a finite multiset of aperiodic necklaces (since $\mathfrak{M}\mathfrak{N}^{\mathfrak{a}}$ is the set of all finite multisets of aperiodic necklaces).

Next, we shall show the following:

Claim 1: Let u be a nonempty word. Let z be a cycle of τ. Then,

$$(\text{the number of all } i \in z \text{ such that } u = w_{\tau,i}) = \delta_{[u],[w]_z}.$$

[*Proof of Claim 1:* The definition of the aperiodic necklace $[w]_z$ yields $[w]_z = \{w_{\tau,i} \mid i \in z\}$. We are in one of the following two cases:

Case 1: We have $[u] = [w]_z$.

Case 2: We have $[u] \neq [w]_z$.

Let us first consider Case 1. In this case, we have $[u] = [w]_z$. Hence, $\delta_{[u],[w]_z} = 1$.

Lemma 13.190.1 yields $u \in [u] = [w]_z = \{w_{\tau,i} \mid i \in z\}$. Proposition 6.6.7(b) shows that any two distinct elements α and β of z satisfy $w_{\tau,\alpha} \neq w_{\tau,\beta}$. In other words, the words $w_{\tau,i}$ for all $i \in z$ are distinct. Hence, there exists **at most one** $i \in z$ such that $u = w_{\tau,i}$. But we also know that there exists **at least one** such i (because $u \in \{w_{\tau,i} \mid i \in z\}$).

Combining the results of the previous two sentences, we conclude that there exists **exactly one** $i \in z$ such that $u = w_{\tau,i}$. In other words,

$$(\text{the number of all } i \in z \text{ such that } u = w_{\tau,i}) = 1.$$

Comparing this with $\delta_{[u],[w]_z} = 1$, we obtain

$$(\text{the number of all } i \in z \text{ such that } u = w_{\tau,i}) = \delta_{[u],[w]_z}.$$

Thus, Claim 1 is proved in Case 1.

Let us now consider Case 2. In this case, we have $[u] \neq [w]_z$. Hence, $\delta_{[u],[w]_z} = 0$.

Also, there exists no $i \in z$ such that $u = w_{\tau,i}$ [1199]. In other words,

$$(\text{the number of all } i \in z \text{ such that } u = w_{\tau,i}) = 0.$$

Comparing this with $\delta_{[u],[w]_z} = 0$, we obtain

$$(\text{the number of all } i \in z \text{ such that } u = w_{\tau,i}) = \delta_{[u],[w]_z}.$$

Thus, Claim 1 is proved in Case 2.

We have now proved Claim 1 in both Cases 1 and 2. Hence, Claim 1 always holds.]

Let $M' = \biguplus_{N \in M} N$. (We are here using the fact that each necklace $N \in M$ is a set, thus a multiset.) Then, M' is a multiset of aperiodic words[1200].

Next, we claim that

$$M' = \left\{w_{\tau,1}, w_{\tau,2}, \ldots, w_{\tau,n}\right\}_{\text{multiset}}. \tag{13.191.2}$$

[*Proof of (13.191.2):* Proposition 6.6.22(a) shows that the words $w_{\tau,1}, w_{\tau,2}, \ldots, w_{\tau,n}$ are aperiodic. Hence, $\{w_{\tau,1}, w_{\tau,2}, \ldots, w_{\tau,n}\}_{\text{multiset}}$ is a multiset of aperiodic words. Thus, both M' and $\{w_{\tau,1}, w_{\tau,2}, \ldots, w_{\tau,n}\}_{\text{multiset}}$ are multisets of aperiodic words.

[1199] *Proof.* Assume the contrary. Thus, there exists some $i \in z$ such that $u = w_{\tau,i}$. In other words, $u \in \{w_{\tau,i} \mid i \in z\}$. This rewrites as $u \in [w]_z$ (since $[w]_z = \{w_{\tau,i} \mid i \in z\}$). Since $[w]_z$ is a necklace, we can thus apply Lemma 13.190.2 to $N = [w]_z$. As a result, we obtain $[w]_z = [u]$. In other words, $[u] = [w]_z$. But this contradicts $[u] \neq [w]_z$. This contradiction shows that our assumption was false, qed.

[1200] Indeed, this was shown in Definition 6.6.26.

Now, let u be an aperiodic word. Hence, u is a nonempty word (since any aperiodic word is nonempty). Lemma 13.191.1 thus yields that

$$\begin{aligned}
(\text{multiplicity of } u \text{ in } M') &= \left(\text{multiplicity of } [u] \text{ in } \underbrace{M}_{=\left\{[w]_z \mid z \text{ is a cycle of } \tau\right\}_{\text{multiset}}}\right) \\
&= \left(\text{multiplicity of } [u] \text{ in } \left\{[w]_z \mid z \text{ is a cycle of } \tau\right\}_{\text{multiset}}\right) \\
&= \left(\text{the number of all cycles } z \text{ of } \tau \text{ such that } [u] = [w]_z\right)
\end{aligned}$$

(by the definition of the multiset $\left\{[w]_z \mid z \text{ is a cycle of } \tau\right\}_{\text{multiset}}$). Comparing this with

$$\begin{aligned}
\sum_{z \text{ is a cycle of } \tau} \delta_{[u],[w]_z} &= \sum_{\substack{z \text{ is a cycle of } \tau;\\ [u]=[w]_z}} \underbrace{\delta_{[u],[w]_z}}_{\substack{=1\\ (\text{since } [u]=[w]_z)}} + \sum_{\substack{z \text{ is a cycle of } \tau;\\ [u]\neq[w]_z}} \underbrace{\delta_{[u],[w]_z}}_{\substack{=0\\ (\text{since } [u]\neq[w]_z)}} \\
&\qquad \left(\begin{array}{c}\text{since each cycle } z \text{ of } \tau \text{ satisfies}\\ \text{either } [u]=[w]_z \text{ or } [u]\neq[w]_z \text{ (but not both)}\end{array}\right) \\
&= \sum_{\substack{z \text{ is a cycle of } \tau;\\ [u]=[w]_z}} 1 + \underbrace{\sum_{\substack{z \text{ is a cycle of } \tau;\\ [u]\neq[w]_z}} 0}_{=0} = \sum_{\substack{z \text{ is a cycle of } \tau;\\ [u]=[w]_z}} 1 \\
&= \left(\text{the number of all cycles } z \text{ of } \tau \text{ such that } [u] = [w]_z\right) \cdot 1 \\
&= \left(\text{the number of all cycles } z \text{ of } \tau \text{ such that } [u] = [w]_z\right),
\end{aligned}$$

we obtain

$$(\text{multiplicity of } u \text{ in } M') = \sum_{z \text{ is a cycle of } \tau} \delta_{[u],[w]_z}. \tag{13.191.3}$$

On the other hand, the definition of the multiset $\left\{w_{\tau,1}, w_{\tau,2}, \ldots, w_{\tau,n}\right\}_{\text{multiset}}$ yields

$$\begin{aligned}
&\left(\text{multiplicity of } u \text{ in } \left\{w_{\tau,1}, w_{\tau,2}, \ldots, w_{\tau,n}\right\}_{\text{multiset}}\right) \\
&= \left(\text{the number of all } i \in \{1,2,\ldots,n\} \text{ such that } u = w_{\tau,i}\right) \\
&= \sum_{z \text{ is a cycle of } \tau} \left(\text{the number of all } i \in z \text{ such that } u = w_{\tau,i}\right)
\end{aligned}$$

(since the cycles of τ are subsets of $\{1,2,\ldots,n\}$, and since each $i \in \{1,2,\ldots,n\}$ belongs to exactly one of these cycles). Hence,

$$\begin{aligned}
&\left(\text{multiplicity of } u \text{ in } \left\{w_{\tau,1}, w_{\tau,2}, \ldots, w_{\tau,n}\right\}_{\text{multiset}}\right) \\
&= \sum_{z \text{ is a cycle of } \tau} \underbrace{\left(\text{the number of all } i \in z \text{ such that } u = w_{\tau,i}\right)}_{\substack{=\delta_{[u],[w]_z}\\ (\text{by Claim 1})}} \\
&= \sum_{z \text{ is a cycle of } \tau} \delta_{[u],[w]_z}.
\end{aligned}$$

Comparing this with (13.191.3), we obtain

$$(\text{multiplicity of } u \text{ in } M') = \left(\text{multiplicity of } u \text{ in } \left\{w_{\tau,1}, w_{\tau,2}, \ldots, w_{\tau,n}\right\}_{\text{multiset}}\right).$$

Now, forget that we fixed u. We thus have proved that

$$(\text{multiplicity of } u \text{ in } M') = \left(\text{multiplicity of } u \text{ in } \left\{w_{\tau,1}, w_{\tau,2}, \ldots, w_{\tau,n}\right\}_{\text{multiset}}\right)$$

for each aperiodic word u. In other words, each aperiodic word u appears in the multisets M' and $\left\{w_{\tau,1}, w_{\tau,2}, \ldots, w_{\tau,n}\right\}_{\text{multiset}}$ with equal multiplicity. Since both M' and $\left\{w_{\tau,1}, w_{\tau,2}, \ldots, w_{\tau,n}\right\}_{\text{multiset}}$ are multisets of aperiodic words, we thus conclude that the multisets M' and $\left\{w_{\tau,1}, w_{\tau,2}, \ldots, w_{\tau,n}\right\}_{\text{multiset}}$ contain the same elements with equal multiplicities. In other words, these multisets M' and $\left\{w_{\tau,1}, w_{\tau,2}, \ldots, w_{\tau,n}\right\}_{\text{multiset}}$ are equal. In other words, $M' = \left\{w_{\tau,1}, w_{\tau,2}, \ldots, w_{\tau,n}\right\}_{\text{multiset}}$. This proves (13.191.2).]

Proposition 6.6.22(b) yields $w_{\tau,1} \leq_\omega w_{\tau,2} \leq_\omega \cdots \leq_\omega w_{\tau,n}$. From $M' = \{w_{\tau,1}, w_{\tau,2}, \ldots, w_{\tau,n}\}_{\text{multiset}}$ and $w_{\tau,1} \leq_\omega w_{\tau,2} \leq_\omega \cdots \leq_\omega w_{\tau,n}$, we conclude that $(w_{\tau,1}, w_{\tau,2}, \ldots, w_{\tau,n})$ is the $\leq_\omega$-increasing list of M'. Thus, the $\leq_\omega$-increasing list of M' has n elements.

Recall that $M' = \biguplus_{N \in M} N$. Hence, Definition 6.6.26 tells us that $\operatorname{RG}(M)$ can be constructed as follows: Let $(m_1, m_2, \ldots, m_n)$ be the $\leq_\omega$-increasing list of M'. (This is well-defined, since the $\leq_\omega$-increasing list of M' has n elements.) For each $i \in \{1, 2, \ldots, n\}$, let ℓ_i be the last letter of the nonempty word m_i. Then, the definition of RG yields $\operatorname{RG}(M) = (\ell_1, \ell_2, \ldots, \ell_n)$.

We shall now use this to show that $\operatorname{RG}(M) = w$.

Indeed, we first observe that $(m_1, m_2, \ldots, m_n) = (w_{\tau,1}, w_{\tau,2}, \ldots, w_{\tau,n})$, since both lists $(m_1, m_2, \ldots, m_n)$ and $(w_{\tau,1}, w_{\tau,2}, \ldots, w_{\tau,n})$ are the $\leq_\omega$-increasing list of M'.

Now, for each $i \in \{1, 2, \ldots, n\}$, we have

$$\begin{aligned}
\ell_i &= \left(\text{the last letter of the nonempty word } \underbrace{m_i}_{\substack{=w_{\tau,i} \\ (\text{since } (m_1,m_2,\ldots,m_n)=(w_{\tau,1},w_{\tau,2},\ldots,w_{\tau,n}))}}\right) \\
&\qquad (\text{since } \ell_i \text{ was defined to be the last letter of the nonempty word } m_i) \\
&= (\text{the last letter of the nonempty word } w_{\tau,i}) \\
&= w_i \qquad \left(\begin{array}{c}\text{since the last letter of the word } w_{\tau,i} \text{ is } w_i \\ (\text{by Proposition 6.6.5(c), applied to } h = i)\end{array}\right).
\end{aligned}$$

In other words, $(\ell_1, \ell_2, \ldots, \ell_n) = (w_1, w_2, \ldots, w_n)$. Comparing this with $w = (w_1, w_2, \ldots, w_n)$, we obtain $(\ell_1, \ell_2, \ldots, \ell_n) = w$. Now, $\operatorname{RG}(M) = (\ell_1, \ell_2, \ldots, \ell_n) = w$.

But $\operatorname{GR} w = M$ (since M was defined as $\operatorname{GR} w$). Now,

$$(\operatorname{RG} \circ \operatorname{GR})(w) = \operatorname{RG}\left(\underbrace{\operatorname{GR} w}_{=M}\right) = \operatorname{RG}(M) = w = \operatorname{id}(w).$$

Forget that we fixed w. We thus have shown that $(\operatorname{RG} \circ \operatorname{GR})(w) = \operatorname{id}(w)$ for each $w \in \mathfrak{A}^*$. In other words, we have $\operatorname{RG} \circ \operatorname{GR} = \operatorname{id}$. This proves Lemma 13.191.2. □

Now, we shall approach the proof of $\operatorname{GR} \circ \operatorname{RG} = \operatorname{id}$. As was explained in the Hint, we can now try to obtain $\operatorname{RG} \circ \operatorname{GR} = \operatorname{id}$ by finding a bijection $\mathfrak{A}^* \to \mathfrak{MN}^{\mathfrak{a}}$, or, more precisely, a bijection between certain finite subsets of $\mathfrak{A}^*$ and $\mathfrak{MN}^{\mathfrak{a}}$. In order to define these subsets, we first introduce a notation:

Definition 13.191.3. Let M be a finite multiset of finite sets (for example, of necklaces). Then, $\operatorname{sum} M$ shall denote the sum of the sizes of all sets $N \in M$ (counted with multiplicities). Formally speaking, this can be defined as follows: Set

$$\operatorname{sum} M = \sum_{N \in \operatorname{Supp} M} (\text{multiplicity of } N \text{ in } M) \cdot |N|. \tag{13.191.4}$$

Equivalently, if $M = \{N_1, N_2, \ldots, N_k\}_{\text{multiset}}$, then

$$\operatorname{sum} M = |N_1| + |N_2| + \cdots + |N_k|. \tag{13.191.5}$$

Example 13.191.4. Applying (13.191.5), we obtain

$$\operatorname{sum}(\{\{1,4\}, \{2,3\}, \{1,2,5\}, \{2,3\}\}_{\text{multiset}}) = |\{1,4\}| + |\{2,3\}| + |\{1,2,5\}| + |\{2,3\}| = 2 + 2 + 3 + 2 = 9.$$

Definition 13.191.5. Let $\mathfrak{B}$ be a subset of $\mathfrak{A}$.

(a) For any $n \in \mathbb{N}$, we have $\mathfrak{B}^n \subset \mathfrak{B}^* \subset \mathfrak{A}^*$ (since $\mathfrak{B} \subset \mathfrak{A}$). Thus, elements of $\mathfrak{B}^n$ are words in $\mathfrak{A}^*$.

(b) A $\mathfrak{B}$-*necklace* will mean a necklace that is a subset of $\mathfrak{B}^*$ (that is, a necklace consisting of words in $\mathfrak{B}^*$).

(c) For any $n \in \mathbb{N}$, we let $\mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}$ denote the set of all finite multisets M of aperiodic $\mathfrak{B}$-necklaces satisfying $\operatorname{sum} M = n$.

Example 13.191.6. For this example, let $\mathfrak{A} = \{1, 2, \ldots, 9\}$ and $\mathfrak{B} = \{2, 4, 6, 8\}$. Then, the necklace $[286] = \{286, 862, 628\}$ is an aperiodic $\mathfrak{B}$-necklace, but the necklace $[25] = \{25, 52\}$ is not a $\mathfrak{B}$-necklace (since $25 \notin \mathfrak{B}^*$). The multiset $M = \{[286], [24], [24]\}_{\text{multiset}}$ is a finite multiset of aperiodic $\mathfrak{B}$-necklaces and satisfies $\operatorname{sum} M = |[286]| + |[24]| + |[24]| = 3 + 2 + 2 = 7$; thus, it belongs to $\mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},7}$.

The sets we introduced in Definition 13.191.5 interact nicely with the Gessel-Reutenauer bijection: For any subset $\mathfrak{B}$ of $\mathfrak{A}$ and any $n \in \mathbb{N}$, the map $\operatorname{GR} : \mathfrak{A}^* \to \mathfrak{MN}^{\mathfrak{a}}$ restricts to a map from $\mathfrak{B}^n$ to $\mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}$. More precisely:

Lemma 13.191.7. *Let $\mathfrak{B}$ be a subset of $\mathfrak{A}$. Let $n \in \mathbb{N}$. Then,* $\operatorname{GR}(\mathfrak{B}^n) \subset \mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}$.

Proof of Lemma 13.191.7. Let $w \in \mathfrak{B}^n$. We shall show that $\operatorname{GR} w \in \mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}$.

Indeed, $w \in \mathfrak{B}^n \subset \mathfrak{A}^n$ (since $\mathfrak{B} \subset \mathfrak{A}$). Hence, $\ell(w) = n$. Let τ be the permutation $(\operatorname{std} w)^{-1} \in \mathfrak{S}_n$. The definition of GR yields

$$\operatorname{GR} w = \{[w]_z \mid z \text{ is a cycle of } \tau\}_{\text{multiset}}. \tag{13.191.6}$$

Now, let z be a cycle of τ. Then, the necklace $[w]_z$ is a subset of $\mathfrak{B}^*$ [1201]. Hence, the necklace $[w]_z$ is a $\mathfrak{B}$-necklace, and thus an aperiodic $\mathfrak{B}$-necklace (since we have seen in the definition of $[w]_z$ that $[w]_z$ is aperiodic).

Forget that we fixed z. We thus have proved that $[w]_z$ is an aperiodic $\mathfrak{B}$-necklace whenever z is a cycle of τ. Hence, the multiset $\{[w]_z \mid z \text{ is a cycle of } \tau\}_{\text{multiset}}$ is a multiset of aperiodic $\mathfrak{B}$-necklaces. In view of (13.191.6), this rewrites as follows: The multiset $\operatorname{GR} w$ is a multiset of aperiodic $\mathfrak{B}$-necklaces. Moreover, this multiset $\operatorname{GR} w$ is clearly finite.

Let us now show that $\operatorname{sum}(\operatorname{GR} w) = n$. Indeed, the cycles of τ form a set partition of the set $\{1, 2, \ldots, n\}$ (that is, they are disjoint nonempty sets, and their union is $\{1, 2, \ldots, n\}$). Hence, the sum of their sizes is $|\{1, 2, \ldots, n\}|$. In other words, $\sum_{z \text{ is a cycle of } \tau} |z| = |\{1, 2, \ldots, n\}|$.

But let us recall that $\operatorname{sum}(\operatorname{GR} w)$ was defined to be the sum of the sizes of all sets $N \in \operatorname{GR} w$ (counted with multiplicities). Since $\operatorname{GR} w = \{[w]_z \mid z \text{ is a cycle of } \tau\}_{\text{multiset}}$, these sets $N \in \operatorname{GR} w$ are precisely the necklaces $[w]_z$ where z ranges over all cycles of τ; hence, the previous sentence says that $\operatorname{sum}(\operatorname{GR} w)$ is the sum of the sizes of the latter necklaces. In other words,

$$\operatorname{sum}(\operatorname{GR} w) = \sum_{z \text{ is a cycle of } \tau} \left| \underbrace{[w]_z}_{\substack{=\{w_{\tau,i} \mid i \in z\} \\ \text{(by the definition of } [w]_z)}} \right| = \sum_{z \text{ is a cycle of } \tau} \underbrace{|\{w_{\tau,i} \mid i \in z\}|}_{\substack{=|z| \\ \text{(by Proposition 6.6.7(c))}}}$$
$$= \sum_{z \text{ is a cycle of } \tau} |z| = |\{1, 2, \ldots, n\}| = n.$$

Altogether, we now know that the multiset $\operatorname{GR} w$ is a finite multiset of aperiodic $\mathfrak{B}$-necklaces and satisfies $\operatorname{sum}(\operatorname{GR} w) = n$. In other words, $\operatorname{GR} w$ is a finite multiset M of aperiodic $\mathfrak{B}$-necklaces satisfying $\operatorname{sum} M = n$. In other words, $\operatorname{GR} w \in \mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}$ (since $\mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}$ was defined as the set of all finite multisets M of aperiodic $\mathfrak{B}$-necklaces satisfying $\operatorname{sum} M = n$).

Forget that we fixed w. We thus have shown that $\operatorname{GR} w \in \mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}$ for each $w \in \mathfrak{B}^n$. In other words, $\operatorname{GR}(\mathfrak{B}^n) \subset \mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}$. This proves Lemma 13.191.7. □

The following fact is almost trivial:

Lemma 13.191.8. *Let $\mathfrak{B}$ be a subset of $\mathfrak{A}$. Let $u \in \mathfrak{B}^*$ be a nonempty word. Then, $[u]$ is a $\mathfrak{B}$-necklace.*

Proof of Lemma 13.191.8. The word $u \in \mathfrak{B}^*$ is nonempty. Thus, there exists a positive integer p such that $u \in \mathfrak{B}^p$. Consider this p. Hence, $u \in \mathfrak{B}^p \subset \mathfrak{A}^p$ (since $\mathfrak{B} \subset \mathfrak{A}$). Therefore, $[u]$ is a well-defined p-necklace (since p is a positive integer), hence a necklace.

[1201] This follows in a straightforward way from the definition of $[w]_z$. (In more detail: The definition of $[w]_z$ yields $[w]_z = \{w_{\tau,i} \mid i \in z\}$. But all letters of the word w belong to $\mathfrak{B}$ (since $w \in \mathfrak{B}^n$). Hence, for each $i \in z$, the word $w_{\tau,i}$ consists entirely of letters in $\mathfrak{B}$ (since the definition of $w_{\tau,i}$ shows that $w_{\tau,i}$ consists of some letters of w, but all letters of w belong to $\mathfrak{B}$), and thus belongs to $\mathfrak{B}^*$. In other words, $\{w_{\tau,i} \mid i \in z\}$ is a subset of $\mathfrak{B}^*$. In other words, $[w]_z$ is a subset of $\mathfrak{B}^*$ (since $[w]_z = \{w_{\tau,i} \mid i \in z\}$). Qed.)

Lemma 13.190.1 yields that $u \in [u]$. In other words, $[u]$ contains u.

The cyclic group C acts on both $\mathfrak{B}^p$ and $\mathfrak{A}^p$ in the same way; thus, the C-set $\mathfrak{B}^p$ is a subset of the C-set $\mathfrak{A}^p$. Hence, the orbit $C \cdot u$ of u is the same no matter whether we are considering u as an element of $\mathfrak{B}^p$ or as an element of the larger C-set $\mathfrak{A}^p$. But considering u as an element of $\mathfrak{B}^p$, we clearly see that this orbit $C \cdot u$ is an orbit of the C-set $\mathfrak{B}^p$; thus, $C \cdot u \subset \mathfrak{B}^p$.

The set $[u]$ is a p-necklace. In other words, $[u]$ is an orbit of the C-action on $\mathfrak{A}^p$ (since this is what "p-necklace" means). Since $[u]$ contains u, we thus conclude that $[u]$ is the orbit of the C-action on $\mathfrak{A}^p$ that contains u. In other words, $[u] = C \cdot u$. Hence, $[u] = C \cdot u \subset \mathfrak{B}^p \subset \mathfrak{B}^*$. In other words, $[u]$ is a subset of $\mathfrak{B}^*$.

Thus, $[u]$ is a necklace that is a subset of $\mathfrak{B}^*$ (since $[u]$ is a necklace). In other words, $[u]$ is a $\mathfrak{B}$-necklace (since a $\mathfrak{B}$-necklace is defined to mean a necklace that is a subset of $\mathfrak{B}^*$). This proves Lemma 13.191.8. □

We shall now use the CFL factorization (introduced in Definition 6.1.25) to establish a bijection between $\mathfrak{B}^n$ and $\mathfrak{M}\mathfrak{N}^{\mathfrak{a}}_{\mathfrak{B},n}$. We recall that every word has a unique CFL factorization (as we have seen in Theorem 6.1.27); thus, we can speak of "the" CFL factorization of a word.

Proposition 13.191.9. *Let $\mathfrak{B}$ be a subset of $\mathfrak{A}$. Let $n \in \mathbb{N}$. Let $w \in \mathfrak{B}^n$. Let $(a_1, a_2, \ldots, a_k)$ be the CFL factorization of the word w. (This factorization exists and is unique, as we proved in Theorem 6.1.27.) Then, $\{[a_1], [a_2], \ldots, [a_k]\}_{\text{multiset}}$ is a well-defined element of $\mathfrak{M}\mathfrak{N}^{\mathfrak{a}}_{\mathfrak{B},n}$.*

Proof of Proposition 13.191.9. We have $w \in \mathfrak{B}^n \subset \mathfrak{B}^*$. Hence, each letter of w belongs to $\mathfrak{B}$. Moreover, from $w \in \mathfrak{B}^n$, we obtain $\ell(w) = n$.

Recall that $(a_1, a_2, \ldots, a_k)$ is the CFL factorization of the word w. According to Definition 6.1.25, this means that $(a_1, a_2, \ldots, a_k)$ is a tuple of Lyndon words satisfying $w = a_1 a_2 \cdots a_k$ and $a_1 \geq a_2 \geq \cdots \geq a_k$. Thus, in particular, $(a_1, a_2, \ldots, a_k)$ is a tuple of Lyndon words. In other words, $a_1, a_2, \ldots, a_k$ are Lyndon words.

Now, we claim the following:

Claim 1: Let $i \in \{1, 2, \ldots, k\}$. Then:
(a) The set $[a_i]$ is a well-defined aperiodic $\mathfrak{B}$-necklace.
(b) We have $|[a_i]| = \ell(a_i)$.

[*Proof of Claim 1:* The word a_i is a Lyndon word (since $a_1, a_2, \ldots, a_k$ are Lyndon words), and thus nonempty (since any Lyndon word is nonempty by definition). Thus, the necklace $[a_i]$ is well-defined.

From $w = a_1 a_2 \cdots a_k$, we conclude that each letter of a_i is a letter of w. Thus, each letter of a_i belongs to $\mathfrak{B}$ (since each letter of w belongs to $\mathfrak{B}$). Hence, $a_i \in \mathfrak{B}^*$. Thus, Lemma 13.191.8 (applied to $u = a_i$) shows that $[a_i]$ is a $\mathfrak{B}$-necklace.

Lemma 13.190.3 (applied to $u = a_i$) shows that the necklace $[a_i]$ is aperiodic (since a_i is a Lyndon word). Thus, $[a_i]$ is an aperiodic $\mathfrak{B}$-necklace (since we already know that $[a_i]$ is a $\mathfrak{B}$-necklace). This proves Claim 1 **(a)**.

(b) The word a_i is nonempty and the necklace $[a_i]$ is aperiodic (as we know); thus, Lemma 13.190.4 (applied to $u = a_i$) yields $|[a_i]| = \ell(a_i)$. This proves Claim 1 **(b)**.]

Now, for each $i \in \{1, 2, \ldots, k\}$, the set $[a_i]$ is a well-defined aperiodic $\mathfrak{B}$-necklace (by Claim 1 **(a)**). In other words, $[a_1], [a_2], \ldots, [a_k]$ are well-defined aperiodic $\mathfrak{B}$-necklaces. Thus, $\{[a_1], [a_2], \ldots, [a_k]\}_{\text{multiset}}$ is a finite multiset of aperiodic $\mathfrak{B}$-necklaces. Moreover, (13.191.5) (applied to $M = \{[a_1], [a_2], \ldots, [a_k]\}_{\text{multiset}}$ and $N_i = [a_i]$) yields

$$\operatorname{sum}(\{[a_1], [a_2], \ldots, [a_k]\}_{\text{multiset}}) = |[a_1]| + |[a_2]| + \cdots + |[a_k]| = \sum_{i=1}^{k} \underbrace{|[a_i]|}_{\substack{=\ell(a_i) \\ \text{(by Claim 1 (b))}}} = \sum_{i=1}^{k} \ell(a_i).$$

Comparing this with

$$\ell\left(\underbrace{w}_{=a_1 a_2 \cdots a_k}\right) = \ell(a_1 a_2 \cdots a_k) = \ell(a_1) + \ell(a_2) + \cdots + \ell(a_k) = \sum_{i=1}^{k} \ell(a_i),$$

we obtain $\operatorname{sum}(\{[a_1], [a_2], \ldots, [a_k]\}_{\text{multiset}}) = \ell(w) = n$. Hence, $\{[a_1], [a_2], \ldots, [a_k]\}_{\text{multiset}}$ is a finite multiset M of aperiodic $\mathfrak{B}$-necklaces satisfying $\operatorname{sum} M = n$ (since we already know that $\{[a_1], [a_2], \ldots, [a_k]\}_{\text{multiset}}$

is a finite multiset of aperiodic $\mathfrak{B}$-necklaces). In other words, $\{[a_1], [a_2], \ldots, [a_k]\}_{\text{multiset}} \in \mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}$ (since $\mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}$ was defined as the set of all such multisets M).

Thus, we have showed that $\{[a_1], [a_2], \ldots, [a_k]\}_{\text{multiset}}$ is a well-defined element of $\mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}$. This proves Proposition 13.191.9. □

Definition 13.191.10. Let $\mathfrak{B}$ be a subset of $\mathfrak{A}$. Let $n \in \mathbb{N}$. Then, we define a map $\operatorname{CFL} : \mathfrak{B}^n \to \mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}$ as follows: For each $w \in \mathfrak{B}^n$, we set $\operatorname{CFL} w = \{[a_1], [a_2], \ldots, [a_k]\}_{\text{multiset}}$, where $(a_1, a_2, \ldots, a_k)$ is the CFL factorization of the word w. (This is well-defined, since Proposition 13.191.9 shows that $\{[a_1], [a_2], \ldots, [a_k]\}_{\text{multiset}}$ is a well-defined element of $\mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}$.)

Example 13.191.11. If $\mathfrak{B} = \{2 < 4 < 6 < 8\}$ and $n = 9$ and $w = 262642424$, then the map CFL sends the word w to $\operatorname{CFL} w = \{[26264], [24], [24]\}_{\text{multiset}}$, since the CFL factorization of w is $(26264, 24, 24)$.

Recall that $\mathfrak{L}$ denotes the set of all Lyndon words, whereas $\mathfrak{N}^{\mathfrak{a}}$ denotes the set of all aperiodic necklaces.

Definition 13.191.12. We define a map $\operatorname{lynd} : \mathfrak{N}^{\mathfrak{a}} \to \mathfrak{L}$ as follows:

Let $N \in \mathfrak{N}^{\mathfrak{a}}$. Thus, N is an aperiodic necklace. Hence, N is a necklace. In other words, N is an n-necklace for some positive integer n (by the definition of a "necklace"). Consider this n. Hence, N is an aperiodic n-necklace. Thus, Exercise 6.1.34(c) shows that N contains exactly one Lyndon word. We define $\operatorname{lynd} N$ to be this Lyndon word. (Thus, $\operatorname{lynd} N \in \mathfrak{L}$; hence, the map $\operatorname{lynd} : \mathfrak{N}^{\mathfrak{a}} \to \mathfrak{L}$ is well-defined.)

Example 13.191.13. If $\mathfrak{A} = \{1 < 2 < 3 < 4 < \cdots\}$ and $N = [4121312]$, then $\operatorname{lynd} N = 1213124$.

Lemma 13.191.14. *Let N be an aperiodic necklace. Then:*

(a) *We have $\ell(\operatorname{lynd} N) = |N|$.*
(b) *We have $[\operatorname{lynd} N] = N$.*
(c) *If u is a Lyndon word such that $u \in N$, then $u = \operatorname{lynd} N$.*
(d) *Let $\mathfrak{B}$ be a subset of $\mathfrak{A}$. Assume that N is a $\mathfrak{B}$-necklace. Then, $\operatorname{lynd} N \in \mathfrak{B}^*$.*

Proof of Lemma 13.191.14. The definition of $\operatorname{lynd} N$ yields that $\operatorname{lynd} N$ is the unique Lyndon word that N contains. In other words, $\operatorname{lynd} N$ is the unique Lyndon word w such that $w \in N$. Hence, $\operatorname{lynd} N$ is a Lyndon word and satisfies $\operatorname{lynd} N \in N$. Hence, Lemma 13.190.2 (applied to $u = \operatorname{lynd} N$) yields $N = [\operatorname{lynd} N]$. This proves Lemma 13.191.14(b).

(a) The word $\operatorname{lynd} N$ is a Lyndon word, and thus is nonempty (since any Lyndon word is nonempty). Moreover, the necklace N is aperiodic. Since $N = [\operatorname{lynd} N]$, this rewrites as follows: The necklace $[\operatorname{lynd} N]$ is aperiodic. Hence, Lemma 13.190.4 (applied to $u = \operatorname{lynd} N$) yields $|[\operatorname{lynd} N]| = \ell(\operatorname{lynd} N)$. Since $N = [\operatorname{lynd} N]$, we now have $|N| = |[\operatorname{lynd} N]| = \ell(\operatorname{lynd} N)$. This proves Lemma 13.191.14(a).

(c) Recall that $\operatorname{lynd} N$ is the unique Lyndon word w such that $w \in N$. Thus, $\operatorname{lynd} N$ is the only such Lyndon word w. In other words, if w is a Lyndon word such that $w \in N$, then $w = \operatorname{lynd} N$. Renaming w as u in this statement, we obtain precisely the claim of Lemma 13.191.14(c).

(d) We know that N is a $\mathfrak{B}$-necklace. In other words, N is a necklace that is a subset of $\mathfrak{B}^*$ (because this is what "$\mathfrak{B}$-necklace" means). Thus, N is a subset of $\mathfrak{B}^*$. In other words, $N \subset \mathfrak{B}^*$. Thus, $\operatorname{lynd} N \in N \subset \mathfrak{B}^*$. This proves Lemma 13.191.14(d). □

Lemma 13.191.15. *Let u be a Lyndon word. Then,* $\operatorname{lynd}[u] = u$.

Proof of Lemma 13.191.15. The necklace $[u]$ is aperiodic (by Lemma 13.190.3). Hence, $\operatorname{lynd}[u]$ is well-defined. Moreover, the word u is Lyndon and thus nonempty (since every Lyndon word is nonempty). Thus, Lemma 13.190.1 yields $u \in [u]$. Hence, Lemma 13.191.14(c) (applied to $N = [u]$) yields $u = \operatorname{lynd}[u]$. This proves Lemma 13.191.15. □

The next definition introduces a notation for a simple and very basic concept: the concept of applying a map $f : X \to Y$ to a finite multiset M of elements of X (by applying f to each element of M).

Definition 13.191.16. Let X and Y be two sets, and let $f : X \to Y$ be any map. Let M be a finite multiset of elements of X. Then, $f_* M$ shall denote the finite multiset of elements of Y obtained by applying f to each element of M. More formally, this multiset $f_* M$ can be defined by the requirement that for any object y, we have

$$(\text{multiplicity of } y \text{ in } f_* M) = \sum_{\substack{x \in X; \\ f(x) = y}} (\text{multiplicity of } x \text{ in } M).$$

More explicitly, f_*M can be described as follows: If $M = \{m_1, m_2, \ldots, m_k\}_{\text{multiset}}$, then

$$f_*M = \{f(m_1), f(m_2), \ldots, f(m_k)\}_{\text{multiset}}. \tag{13.191.7}$$

Example 13.191.17. Let $X = \mathbb{Z}$ and $Y = \mathbb{N}$, and let $f : X \to Y$ be the map that sends each $x \in \mathbb{Z}$ to $x^2 \in \mathbb{N}$. Then, (13.191.7) yields $f_*(\{-2, 2, 3, 3\}_{\text{multiset}}) = \{f(-2), f(2), f(3), f(3)\}_{\text{multiset}} = \{4, 4, 9, 9\}_{\text{multiset}}$.

Example 13.191.18. Let M be the finite multiset $\{[13], [13], [4252]\}_{\text{multiset}}$ of aperiodic necklaces. Then, (13.191.7) yields

$$\operatorname{lynd}_* M = \{\operatorname{lynd}[13], \operatorname{lynd}[13], \operatorname{lynd}[4252]\}_{\text{multiset}} = \{13, 13, 2425\}_{\text{multiset}}.$$

Lemma 13.191.19. *Let M be a finite multiset of aperiodic necklaces. Let $\widetilde{M}$ be the multiset $\operatorname{lynd}_* M$. Then:*

(a) *The multiset $\widetilde{M}$ is a finite multiset of Lyndon words.*

Now, let $b_1, b_2, \ldots, b_k$ be some Lyndon words such that $\widetilde{M} = \{b_1, b_2, \ldots, b_k\}_{\text{multiset}}$. Then:

(b) *We have $M = \{[b_1], [b_2], \ldots, [b_k]\}_{\text{multiset}}$.*

(c) *We have $\operatorname{sum} M = \ell(b_1) + \ell(b_2) + \cdots + \ell(b_k)$.*

Proof of Lemma 13.191.19. We know that M is a finite multiset of aperiodic necklaces, i.e., a finite multiset of elements of $\mathfrak{N}^{\mathfrak{a}}$. Hence, $\operatorname{lynd}_* M$ is well-defined and is a finite multiset of elements of $\mathfrak{L}$ (since lynd is a map from $\mathfrak{N}^{\mathfrak{a}}$ to $\mathfrak{L}$). In other words, $\operatorname{lynd}_* M$ is well-defined and is a finite multiset of elements of Lyndon words (since the elements of $\mathfrak{L}$ are the Lyndon words). In other words, $\widetilde{M}$ is well-defined and is a finite multiset of elements of Lyndon words (because $\widetilde{M} = \operatorname{lynd}_* M$). This proves Lemma 13.191.19(a).

Write the multiset M in the form $M = \{N_1, N_2, \ldots, N_i\}_{\text{multiset}}$ for some aperiodic necklaces $N_1, N_2, \ldots, N_i$. (This can be done, since M is a finite multiset of aperiodic necklaces.)

From $M = \{N_1, N_2, \ldots, N_i\}_{\text{multiset}}$, we obtain $\operatorname{lynd}_* M = \{\operatorname{lynd} N_1, \operatorname{lynd} N_2, \ldots, \operatorname{lynd} N_i\}_{\text{multiset}}$ (by (13.191.7), applied to $\mathfrak{N}^{\mathfrak{a}}$, $\mathfrak{L}$, lynd, i and N_j instead of X, Y, f, k and m_j). Hence,

$$\widetilde{M} = \operatorname{lynd}_* M = \{\operatorname{lynd} N_1, \operatorname{lynd} N_2, \ldots, \operatorname{lynd} N_i\}_{\text{multiset}}. \tag{13.191.8}$$

(b) For each $r \in \{1, 2, \ldots, i\}$, the set N_r is an aperiodic necklace (since $N_1, N_2, \ldots, N_i$ are aperiodic necklaces) and therefore satisfies $[\operatorname{lynd} N_r] = N_r$ (by Lemma 13.191.14(b), applied to $N = N_r$). In other words,

$$([\operatorname{lynd} N_1], [\operatorname{lynd} N_2], \ldots, [\operatorname{lynd} N_i]) = (N_1, N_2, \ldots, N_i). \tag{13.191.9}$$

But comparing (13.191.8) with $\widetilde{M} = \{b_1, b_2, \ldots, b_k\}_{\text{multiset}}$, we obtain

$$\{b_1, b_2, \ldots, b_k\}_{\text{multiset}} = \{\operatorname{lynd} N_1, \operatorname{lynd} N_2, \ldots, \operatorname{lynd} N_i\}_{\text{multiset}}.$$

Thus, the k-tuple $(b_1, b_2, \ldots, b_k)$ is a permutation of the i-tuple $(\operatorname{lynd} N_1, \operatorname{lynd} N_2, \ldots, \operatorname{lynd} N_i)$. Hence,

$$\{[b_1], [b_2], \ldots, [b_k]\}_{\text{multiset}} = \{[\operatorname{lynd} N_1], [\operatorname{lynd} N_2], \ldots, [\operatorname{lynd} N_i]\}_{\text{multiset}} = \{N_1, N_2, \ldots, N_i\}_{\text{multiset}}$$

(by (13.191.9)). Comparing this with $M = \{N_1, N_2, \ldots, N_i\}_{\text{multiset}}$, we obtain $M = \{[b_1], [b_2], \ldots, [b_k]\}_{\text{multiset}}$. This proves Lemma 13.191.19(b).

(c) For each $r \in \{1, 2, \ldots, i\}$, the set N_r is an aperiodic necklace (since $N_1, N_2, \ldots, N_i$ are aperiodic necklaces) and therefore satisfies

$$\ell(\operatorname{lynd} N_r) = |N_r| \tag{13.191.10}$$

(by Lemma 13.191.14(a), applied to $N = N_r$).

In our above proof of Lemma 13.191.19(b), we have showed that the k-tuple $(b_1, b_2, \ldots, b_k)$ is a permutation of the i-tuple $(\operatorname{lynd} N_1, \operatorname{lynd} N_2, \ldots, \operatorname{lynd} N_i)$. Hence,

$$\begin{aligned}\ell(b_1) + \ell(b_2) + \cdots + \ell(b_k) &= \ell(\operatorname{lynd} N_1) + \ell(\operatorname{lynd} N_2) + \cdots + \ell(\operatorname{lynd} N_i) \\ &= \sum_{r=1}^{i} \underbrace{\ell(\operatorname{lynd} N_r)}_{\substack{=|N_r| \\ \text{(by (13.191.10))}}} = \sum_{r=1}^{i} |N_r| = |N_1| + |N_2| + \cdots + |N_i|.\end{aligned}$$

But (13.191.5) (applied to i instead of k) yields

$$\operatorname{sum} M = |N_1| + |N_2| + \cdots + |N_i| \qquad (\text{since } M = \{N_1, N_2, \ldots, N_i\}_{\text{multiset}}) .$$

Comparing these two equalities, we find $\operatorname{sum} M = \ell(b_1) + \ell(b_2) + \cdots + \ell(b_k)$. This proves Lemma 13.191.19(c). □

Proposition 13.191.20. *Let $\mathfrak{B}$ be a subset of $\mathfrak{A}$. Let $n \in \mathbb{N}$. Let $M \in \mathfrak{M}\mathfrak{N}^{\mathfrak{a}}_{\mathfrak{B},n}$. Then, M is a finite multiset of aperiodic $\mathfrak{B}$-necklaces. Let $\widetilde{M}$ be the multiset $\operatorname{lynd}_* M$. This $\widetilde{M}$ is a finite multiset of Lyndon words (by Lemma 13.191.19(a)). Let $(b_1, b_2, \ldots, b_k)$ be the $\leq$-increasing list of $\widetilde{M}$. (Here we are using the lexicographic order $\leq$, not the relation $\leq_\omega$.)*

Then, $b_k b_{k-1} \cdots b_1 \in \mathfrak{B}^n$.

Proof of Proposition 13.191.20. We have $M \in \mathfrak{M}\mathfrak{N}^{\mathfrak{a}}_{\mathfrak{B},n}$. In other words, M is a finite multiset of aperiodic $\mathfrak{B}$-necklaces satisfying $\operatorname{sum} M = n$ (since $\mathfrak{M}\mathfrak{N}^{\mathfrak{a}}_{\mathfrak{B},n}$ was defined to be the set of all such multisets). Hence, in particular, M is a finite multiset of aperiodic necklaces (since each $\mathfrak{B}$-necklace is a necklace). Thus, $\operatorname{lynd}_* M$ is well-defined.

The list $(b_1, b_2, \ldots, b_k)$ is the $\leq$-increasing list of $\widetilde{M}$ (by its definition). Hence, $\widetilde{M} = \{b_1, b_2, \ldots, b_k\}_{\text{multiset}}$. Thus, $b_1, b_2, \ldots, b_k$ are elements of $\widetilde{M}$, and therefore are Lyndon words (since $\widetilde{M}$ is a multiset of Lyndon words). Thus, Lemma 13.191.19(b) yields $M = \{[b_1], [b_2], \ldots, [b_k]\}_{\text{multiset}}$.

Now, let $i \in \{1, 2, \ldots, k\}$. Then, $[b_i]$ is an element of M (since $M = \{[b_1], [b_2], \ldots, [b_k]\}_{\text{multiset}}$). Thus, $[b_i]$ is an aperiodic $\mathfrak{B}$-necklace (since M is a finite multiset of aperiodic $\mathfrak{B}$-necklaces), hence a $\mathfrak{B}$-necklace, and thus a subset of $\mathfrak{B}^*$ (by the definition of a $\mathfrak{B}$-necklace). In other words, $[b_i] \subset \mathfrak{B}^*$. But b_i is a Lyndon word (since $b_1, b_2, \ldots, b_k$ are Lyndon words), and thus a nonempty word (since any Lyndon word is nonempty). Hence, Lemma 13.190.1 (applied to $u = b_i$) yields $b_i \in [b_i] \subset \mathfrak{B}^*$.

Forget that we fixed i. We thus have shown that $b_i \in \mathfrak{B}^*$ for each $i \in \{1, 2, \ldots, k\}$. Hence, $b_k b_{k-1} \cdots b_1 \in \mathfrak{B}^*$.

But Lemma 13.191.19(c) yields $\operatorname{sum} M = \ell(b_1) + \ell(b_2) + \cdots + \ell(b_k)$. Comparing this with $\operatorname{sum} M = n$, we obtain

$$\ell(b_1) + \ell(b_2) + \cdots + \ell(b_k) = n.$$

Now, combining $b_k b_{k-1} \cdots b_1 \in \mathfrak{B}^*$ with

$$\ell(b_k b_{k-1} \cdots b_1) = \ell(b_k) + \ell(b_{k-1}) + \cdots + \ell(b_1) = \ell(b_1) + \ell(b_2) + \cdots + \ell(b_k) = n,$$

we obtain $b_k b_{k-1} \cdots b_1 \in \mathfrak{B}^n$. This proves Proposition 13.191.20. □

Definition 13.191.21. Let $\mathfrak{B}$ be a subset of $\mathfrak{A}$. Let $n \in \mathbb{N}$. Then, we define a map $\operatorname{LFC} : \mathfrak{M}\mathfrak{N}^{\mathfrak{a}}_{\mathfrak{B},n} \to \mathfrak{B}^n$ as follows: Let $M \in \mathfrak{M}\mathfrak{N}^{\mathfrak{a}}_{\mathfrak{B},n}$. Then, M is a finite multiset of aperiodic $\mathfrak{B}$-necklaces. Let $\widetilde{M}$ be the multiset $\operatorname{lynd}_* M$. This $\widetilde{M}$ is a finite multiset of Lyndon words (by Lemma 13.191.19(a)). Let $(b_1, b_2, \ldots, b_k)$ be the $\leq$-increasing list of $\widetilde{M}$. Then, we set $\operatorname{LFC}(M) = b_k b_{k-1} \cdots b_1$. (This is well-defined, since Proposition 13.191.20 shows that $b_k b_{k-1} \cdots b_1 \in \mathfrak{B}^n$.)

Example 13.191.22. If $\mathfrak{B} = \{2 < 4 < 6 < 8\}$ and $n = 9$ and $M = \{[26264], [24], [24]\}_{\text{multiset}}$, then the multiset $\widetilde{M}$ in Definition 13.191.21 is $\{26264, 24, 24\}_{\text{multiset}}$, and its $\leq$-increasing list is $(24, 24, 26264)$, so that $\operatorname{LFC}(M) = 262642424$.

Proposition 13.191.23. *Let $\mathfrak{B}$ be a subset of $\mathfrak{A}$. Let $n \in \mathbb{N}$. Then, the maps $\operatorname{CFL} : \mathfrak{B}^n \to \mathfrak{M}\mathfrak{N}^{\mathfrak{a}}_{\mathfrak{B},n}$ and $\operatorname{LFC} : \mathfrak{M}\mathfrak{N}^{\mathfrak{a}}_{\mathfrak{B},n} \to \mathfrak{B}^n$ (introduced in Definition 13.191.10 and in Definition 13.191.21) are mutually inverse.*

Proof of Proposition 13.191.23. We shall prove two claims:

Claim 1: We have $\operatorname{CFL} \circ \operatorname{LFC} = \operatorname{id}$.

[*Proof of Claim 1:* Let $M \in \mathfrak{M}\mathfrak{N}^{\mathfrak{a}}_{\mathfrak{B},n}$. Thus, M is a finite multiset of aperiodic $\mathfrak{B}$-necklaces satisfying $\operatorname{sum} M = n$ (since $\mathfrak{M}\mathfrak{N}^{\mathfrak{a}}_{\mathfrak{B},n}$ was defined to be the set of all such multisets). Hence, M is a finite multiset of elements of $\mathfrak{N}^{\mathfrak{a}}$. Thus, $\operatorname{lynd}_* M$ is well-defined.

Let $\widetilde{M}$ be the multiset $\operatorname{lynd}_* M$. This $\widetilde{M}$ is a finite multiset of Lyndon words (by Lemma 13.191.19(a)). Let $(b_1, b_2, \ldots, b_k)$ be the $\leq$-increasing list of $\widetilde{M}$. According to the definition of a $\leq$-increasing list, this means that $\widetilde{M} = \{b_1, b_2, \ldots, b_k\}_{\text{multiset}}$ and $b_1 \leq b_2 \leq \cdots \leq b_k$. Now, $b_1, b_2, \ldots, b_k$ are Lyndon words (since

$\{b_1, b_2, \ldots, b_k\}_{\text{multiset}} = \widetilde{M}$ is a multiset of Lyndon words). Hence, $(b_k, b_{k-1}, \ldots, b_1)$ is a tuple of Lyndon words.

Define $w \in \mathfrak{B}^*$ by $w = \operatorname{LFC}(M)$. Thus, $w = \operatorname{LFC}(M) = b_k b_{k-1} \cdots b_1$ (by the definition of the map LFC).

We shall now show that $\operatorname{CFL} w = M$.

Indeed, $b_1 \leq b_2 \leq \cdots \leq b_k$. In other words, $b_k \geq b_{k-1} \geq \cdots \geq b_1$. Combining this with the fact that $(b_k, b_{k-1}, \ldots, b_1)$ is a tuple of Lyndon words, we conclude that $(b_k, b_{k-1}, \ldots, b_1)$ is the CFL factorization of w (by the definition of the CFL factorization).

On the other hand, M is a finite multiset of aperiodic necklaces. Moreover, $b_1, b_2, \ldots, b_k$ are Lyndon words and satisfy $\widetilde{M} = \{b_1, b_2, \ldots, b_k\}_{\text{multiset}}$. Hence, Lemma 13.191.19(b) yields $M = \{[b_1], [b_2], \ldots, [b_k]\}_{\text{multiset}}$.

But the definition of the map CFL yields that if $(a_1, a_2, \ldots, a_k)$ is the CFL factorization of the word w, then

$$\operatorname{CFL} w = \{[a_1], [a_2], \ldots, [a_k]\}_{\text{multiset}}.$$

Applying this to $(a_1, a_2, \ldots, a_k) = (b_k, b_{k-1}, \ldots, b_1)$, we obtain

$$\begin{aligned} \operatorname{CFL} w &= \{[b_k], [b_{k-1}], \ldots, [b_1]\}_{\text{multiset}} && (\text{since } (b_k, b_{k-1}, \ldots, b_1) \text{ is the CFL factorization of } w) \\ &= \{[b_1], [b_2], \ldots, [b_k]\}_{\text{multiset}} = M && (\text{since } M = \{[b_1], [b_2], \ldots, [b_k]\}_{\text{multiset}}). \end{aligned}$$

In view of $w = \operatorname{LFC}(M)$, this rewrites as $\operatorname{CFL}(\operatorname{LFC}(M)) = M$. Thus, $(\operatorname{CFL} \circ \operatorname{LFC})(M) = \operatorname{CFL}(\operatorname{LFC}(M)) = M = \operatorname{id}(M)$.

Forget that we fixed M. We thus have showed that $(\operatorname{CFL} \circ \operatorname{LFC})(M) = \operatorname{id}(M)$ for each $M \in \mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}$. In other words, $\operatorname{CFL} \circ \operatorname{LFC} = \operatorname{id}$. Thus, Claim 1 is proven.]

Claim 2: We have $\operatorname{LFC} \circ \operatorname{CFL} = \operatorname{id}$.

[*Proof of Claim 2:* Let $w \in \mathfrak{B}^n$. Let $(a_1, a_2, \ldots, a_k)$ be the CFL factorization of the word w. Then, the definition of CFL yields $\operatorname{CFL} w = \{[a_1], [a_2], \ldots, [a_k]\}_{\text{multiset}}$.

We know that $(a_1, a_2, \ldots, a_k)$ is a CFL factorization of w. In other words, $(a_1, a_2, \ldots, a_k)$ is a tuple of Lyndon words satisfying $w = a_1 a_2 \cdots a_k$ and $a_1 \geq a_2 \geq \cdots \geq a_k$ (because this is how a "CFL factorization of w" is defined). In particular, $a_1, a_2, \ldots, a_k$ are Lyndon words (since $(a_1, a_2, \ldots, a_k)$ is a tuple of Lyndon words).

Hence, for each $i \in \{1, 2, \ldots, k\}$, the word a_i is a Lyndon word, and therefore satisfies $\operatorname{lynd}[a_i] = a_i$ (by Lemma 13.191.15, applied to $u = a_i$). In other words,

$$(\operatorname{lynd}[a_1], \operatorname{lynd}[a_2], \ldots, \operatorname{lynd}[a_k]) = (a_1, a_2, \ldots, a_k). \tag{13.191.11}$$

Let M denote the multiset $\operatorname{CFL} w \in \mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}$.

Thus, $M \in \mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}$. In other words, M is a finite multiset of aperiodic $\mathfrak{B}$-necklaces satisfying $\operatorname{sum} M = n$ (since $\mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}$ was defined to be the set of all such multisets). Hence, M is a finite multiset of elements of $\mathfrak{N}^{\mathfrak{a}}$. Thus, $\operatorname{lynd}_* M$ is well-defined.

The definition of M yields $M = \operatorname{CFL} w = \{[a_1], [a_2], \ldots, [a_k]\}_{\text{multiset}}$. Hence,

$$\operatorname{lynd}_* M = \{\operatorname{lynd}[a_1], \operatorname{lynd}[a_2], \ldots, \operatorname{lynd}[a_k]\}_{\text{multiset}}$$

(by (13.191.7), applied to $\mathfrak{N}^{\mathfrak{a}}$, $\mathfrak{L}$, lynd and $[a_j]$ instead of X, Y, f and m_j).

Let $\widetilde{M}$ be the multiset $\operatorname{lynd}_* M$. This $\widetilde{M}$ is a finite multiset of Lyndon words (by Lemma 13.191.19(a)), and satisfies

$$\begin{aligned} \widetilde{M} &= \operatorname{lynd}_* M = \{\operatorname{lynd}[a_1], \operatorname{lynd}[a_2], \ldots, \operatorname{lynd}[a_k]\}_{\text{multiset}} \\ &= \{a_1, a_2, \ldots, a_k\}_{\text{multiset}} && (\text{by } (13.191.11)) \\ &= \{a_k, a_{k-1}, \ldots, a_1\}_{\text{multiset}}. \end{aligned}$$

Also, recall that $a_1 \geq a_2 \geq \cdots \geq a_k$. In other words, $a_k \leq a_{k-1} \leq \cdots \leq a_1$.

Now, $(a_k, a_{k-1}, \ldots, a_1)$ is the $\leq$-increasing list of $\widetilde{M}$ (because $\widetilde{M} = \{a_k, a_{k-1}, \ldots, a_1\}_{\text{multiset}}$ and $a_k \leq a_{k-1} \leq \cdots \leq a_1$). But the definition of LFC shows that if $(b_1, b_2, \ldots, b_k)$ is the $\leq$-increasing list of $\widetilde{M}$, then

$$\operatorname{LFC}(M) = b_k b_{k-1} \cdots b_1.$$

We can apply this to $(b_1, b_2, \ldots, b_k) = (a_k, a_{k-1}, \ldots, a_1)$ (since $(a_k, a_{k-1}, \ldots, a_1)$ is the $\leq$-increasing list of $\widetilde{M}$); thus, we obtain $\operatorname{LFC}(M) = a_1 a_2 \cdots a_k$. Comparing this with $w = a_1 a_2 \cdots a_k$, we obtain $\operatorname{LFC}(M) = w$.

In view of $M = \operatorname{CFL} w$, this rewrites as $\operatorname{LFC}(\operatorname{CFL} w) = w$. Hence,

$$(\operatorname{LFC} \circ \operatorname{CFL})(w) = \operatorname{LFC}(\operatorname{CFL} w) = w = \operatorname{id}(w).$$

Forget that we fixed w. We thus have shown that $(\operatorname{LFC} \circ \operatorname{CFL})(w) = \operatorname{id}(w)$ for each $w \in \mathfrak{B}^n$. In other words, $\operatorname{LFC} \circ \operatorname{CFL} = \operatorname{id}$. This proves Claim 2.]

We have $\operatorname{CFL} \circ \operatorname{LFC} = \operatorname{id}$ (by Claim 1) and $\operatorname{LFC} \circ \operatorname{CFL} = \operatorname{id}$ (by Claim 2). Combining these two equalities, we conclude that the maps $\operatorname{CFL} : \mathfrak{B}^n \to \mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}$ and $\operatorname{LFC} : \mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n} \to \mathfrak{B}^n$ are mutually inverse. This proves Proposition 13.191.23. □

Corollary 13.191.24. *Let $\mathfrak{B}$ be a finite subset of $\mathfrak{A}$. Let $n \in \mathbb{N}$. Then:*

(a) *The sets $\mathfrak{B}^n$ and $\mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}$ are finite and satisfy $|\mathfrak{B}^n| = \left|\mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}\right|$.*

(b) *Any injective map $f : \mathfrak{B}^n \to \mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}$ is bijective.*

Proof of Corollary 13.191.24. The set $\mathfrak{B}$ is finite. Hence, the set $\mathfrak{B}^n$ is finite as well.

Proposition 13.191.23 shows that the maps $\operatorname{CFL} : \mathfrak{B}^n \to \mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}$ and $\operatorname{LFC} : \mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n} \to \mathfrak{B}^n$ (defined as in Proposition 13.191.23) are mutually inverse. Thus, these two maps are bijections. Hence, there exists a bijection from $\mathfrak{B}^n$ to $\mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}$. This entails $|\mathfrak{B}^n| = \left|\mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}\right|$. Since $\mathfrak{B}^n$ is finite, this shows that $\mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}$ is finite as well. Thus, Corollary 13.191.24(a) is proven.

(b) Let $f : \mathfrak{B}^n \to \mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}$ be any injective map. We must prove that f is bijective.

Corollary 13.191.24(a) shows that $\mathfrak{B}^n$ and $\mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}$ are two finite sets of equal sizes. Hence, f is a map between two finite sets of equal sizes. But it is well-known that any injective map between two finite sets of equal sizes is bijective[1202]. Thus, f is bijective. This proves Corollary 13.191.24(b).

□

Now, at last we can prove the following:

Lemma 13.191.25. *We have* $\operatorname{GR} \circ \operatorname{RG} = \operatorname{id}$.

Proof of Lemma 13.191.25. Lemma 13.191.2 yields $\operatorname{RG} \circ \operatorname{GR} = \operatorname{id}$. Thus, the map GR has a left inverse (namely, RG). Therefore, the map GR is injective.

Let $M \in \mathfrak{MN}^{\mathfrak{a}}$. We shall show that $(\operatorname{GR} \circ \operatorname{RG})(M) = M$.

We have $M \in \mathfrak{MN}^{\mathfrak{a}}$. In other words, M is a finite multiset of aperiodic necklaces (by the definition of $\mathfrak{MN}^{\mathfrak{a}}$). Thus, each element of M is an aperiodic necklace.

Let $n = \operatorname{sum} M$; thus, $n \in \mathbb{N}$.

Define a subset $\mathfrak{B}$ of $\mathfrak{A}$ by

$$\mathfrak{B} = \bigcup_{N \in M} \bigcup_{w \in N} \{\text{all letters of } w\} \tag{13.191.12}$$

(where the "$\bigcup_{N \in M}$" symbol should be understood as "$\bigcup_{N \in \operatorname{Supp} M}$").

Thus, $\mathfrak{B}$ is a finite union of finite unions of finite sets[1203]. Thus, the set $\mathfrak{B}$ is finite. Furthermore, the definition of $\mathfrak{B}$ ensures that each $N \in M$ is an aperiodic $\mathfrak{B}$-necklace[1204]. Thus, M is a finite multiset of aperiodic $\mathfrak{B}$-necklaces. Hence, M is a finite multiset of aperiodic $\mathfrak{B}$-necklaces satisfying $\operatorname{sum} M = n$ (since $n = \operatorname{sum} M$). In other words, $M \in \mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}$ (by the definition of $\mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}$).

But Lemma 13.191.7 yields that $\operatorname{GR}(\mathfrak{B}^n) \subset \mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}$. In other words, $\operatorname{GR}(w) \in \mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}$ for each $w \in \mathfrak{B}^n$. Thus, we can define a map

$$\begin{aligned} \overline{\operatorname{GR}} : \mathfrak{B}^n &\to \mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}, \\ w &\mapsto \operatorname{GR}(w). \end{aligned}$$

[1202] This is one of the basic facts known as the "pigeonhole principle".

[1203] To wit:

- There are only finitely many $N \in M$ (since M is finite).
- For each $N \in M$, there are only finitely many $w \in N$ (since N is a necklace, thus a finite set).
- For each $N \in M$ and each $w \in N$, the set $\{\text{all letters of } w\}$ is finite (since the word w has only finitely many letters).

[1204] *Proof.* Let $N \in M$. Then, N is an aperiodic necklace (since each element of M is an aperiodic necklace).

But (13.191.12) shows that $\bigcup_{w \in N} \{\text{all letters of } w\} \subset \mathfrak{B}$ (since $N \in M$). In other words, each $w \in N$ satisfies $\{\text{all letters of } w\} \subset \mathfrak{B}$. In other words, each $w \in N$ satisfies $w \in \mathfrak{B}^*$. In other words, $N \subset \mathfrak{B}^*$. Hence, N is a $\mathfrak{B}$-necklace (since N is a necklace), hence an aperiodic $\mathfrak{B}$-necklace (since N is aperiodic). Qed.

Consider this map $\overline{\mathrm{GR}}$. Clearly, this map $\overline{\mathrm{GR}}$ is a restriction of the map GR; hence, this map $\overline{\mathrm{GR}}$ is injective (since the map GR is injective). Hence, Corollary 13.191.24(b) (applied to $f = \overline{\mathrm{GR}}$) yields that the map $\overline{\mathrm{GR}}$ is bijective. Thus, $\mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n} = \overline{\mathrm{GR}}\left(\mathfrak{B}^n\right)$.

Now, $M \in \mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n} = \overline{\mathrm{GR}}\left(\mathfrak{B}^n\right)$. In other words, there exists some $w \in \mathfrak{B}^n$ satisfying $M = \overline{\mathrm{GR}}\ w$. Consider this w. We have $M = \overline{\mathrm{GR}}\ w = \mathrm{GR}\, w$ (by the definition of $\overline{\mathrm{GR}}$). Now,

$$(\mathrm{GR} \circ \mathrm{RG})\left(\underbrace{M}_{=\mathrm{GR}\, w}\right) = (\mathrm{GR} \circ \mathrm{RG})(\mathrm{GR}\, w) = \left(\mathrm{GR} \circ \underbrace{\mathrm{RG} \circ \mathrm{GR}}_{=\mathrm{id}}\right)(w) = \mathrm{GR}\, w = M = \mathrm{id}(M).$$

Forget that we fixed M. We thus have proved that $(\mathrm{GR} \circ \mathrm{RG})(M) = \mathrm{id}(M)$ for each $M \in \mathfrak{MN}^{\mathfrak{a}}$. In other words, $\mathrm{GR} \circ \mathrm{RG} = \mathrm{id}$. This proves Lemma 13.191.25. □

Proof of Theorem 6.6.29. We have $\mathrm{GR} \circ \mathrm{RG} = \mathrm{id}$ (by Lemma 13.191.25) and $\mathrm{RG} \circ \mathrm{GR} = \mathrm{id}$ (by Lemma 13.191.2). These two equalities combined yield the claim of Theorem 6.6.29. □

Hence, Exercise 6.6.30 is solved.

13.192. **Solution to Exercise 6.6.51.**

Solution to Exercise 6.6.51. In order to solve Exercise 6.6.51, we must prove the statements made in Subsection 6.6.2. We shall begin with Proposition 6.6.39. First, let us show a few simple lemmas about words $w \in \mathfrak{A}^*$ and the respective monomials $\mathbf{x}_w$:

Lemma 13.192.1. *Let u and v be two words in $\mathfrak{A}^*$. Then, $\mathbf{x}_{uv} = \mathbf{x}_u \mathbf{x}_v$.*

Proof of Lemma 13.192.1. Write the word u in the form $u = (u_1, u_2, \ldots, u_p)$. Then, the definition of $\mathbf{x}_u$ yields $\mathbf{x}_u = x_{u_1} x_{u_2} \cdots x_{u_p}$.

Write the word v in the form $v = (v_1, v_2, \ldots, v_q)$. Then, the definition of $\mathbf{x}_v$ yields $\mathbf{x}_v = x_{v_1} x_{v_2} \cdots x_{v_q}$.

From $u = (u_1, u_2, \ldots, u_p)$ and $v = (v_1, v_2, \ldots, v_q)$, we obtain

$$uv = (u_1, u_2, \ldots, u_p)(v_1, v_2, \ldots, v_q) = (u_1, u_2, \ldots, u_p, v_1, v_2, \ldots, v_q).$$

Hence, the definition of $\mathbf{x}_{uv}$ yields

$$\mathbf{x}_{uv} = x_{u_1} x_{u_2} \cdots x_{u_p} x_{v_1} x_{v_2} \cdots x_{v_q}.$$

Comparing this with

$$\underbrace{\mathbf{x}_u}_{=x_{u_1} x_{u_2} \cdots x_{u_p}} \underbrace{\mathbf{x}_v}_{=x_{v_1} x_{v_2} \cdots x_{v_q}} = x_{u_1} x_{u_2} \cdots x_{u_p} x_{v_1} x_{v_2} \cdots x_{v_q},$$

we obtain $\mathbf{x}_{uv} = \mathbf{x}_u \mathbf{x}_v$. This proves Lemma 13.192.1. □

Lemma 13.192.2. *Let $k \in \mathbb{N}$. Let $a_1, a_2, \ldots, a_k$ be words in $\mathfrak{A}^*$. Then, $\mathbf{x}_{a_1 a_2 \cdots a_k} = \mathbf{x}_{a_1} \mathbf{x}_{a_2} \cdots \mathbf{x}_{a_k}$.*

Proof of Lemma 13.192.2. Lemma 13.192.2 follows by induction on k, using Lemma 13.192.1 in the induction step. □

Lemma 13.192.3. *Let $n \in \mathbb{N}$. Then, $\sum_{w \in \mathfrak{A}^n} \mathbf{x}_w = p_1^n$.*

Proof of Lemma 13.192.3. The definition of p_1 yields

$$p_1 = x_1^1 + x_2^1 + x_3^1 + \cdots = \sum_{a \in \{1,2,3,\ldots\}} \underbrace{x_a^1}_{=x_a} = \sum_{a \in \{1,2,3,\ldots\}} x_a = \sum_{a \in \mathfrak{A}} x_a$$

(since $\{1, 2, 3, \ldots\} = \mathfrak{A}$). Taking both sides of this equality to the n-th power, we obtain

$$\begin{aligned} p_1^n &= \left(\sum_{a \in \mathfrak{A}} x_a\right)^n \\ &= \sum_{(a_1, a_2, \ldots, a_n) \in \mathfrak{A}^n} x_{a_1} x_{a_2} \cdots x_{a_n} \qquad \text{(by the product rule)} \\ &= \sum_{(w_1, w_2, \ldots, w_n) \in \mathfrak{A}^n} x_{w_1} x_{w_2} \cdots x_{w_n} \end{aligned} \tag{13.192.1}$$

(here, we have renamed the summation index $(a_1, a_2, \ldots, a_n)$ as $(w_1, w_2, \ldots, w_n)$).

Each $w \in \mathfrak{A}^n$ can be written uniquely in the form $w = (w_1, w_2, \ldots, w_n)$. Hence, we can substitute $(w_1, w_2, \ldots, w_n)$ for w in the sum $\sum_{w \in \mathfrak{A}^n} \mathbf{x}_w$. We thus obtain

$$\sum_{w \in \mathfrak{A}^n} \mathbf{x}_w = \sum_{(w_1, w_2, \ldots, w_n) \in \mathfrak{A}^n} \underbrace{\mathbf{x}_{(w_1, w_2, \ldots, w_n)}}_{\substack{= x_{w_1} x_{w_2} \cdots x_{w_n} \\ \text{(by the definition of } \mathbf{x}_{(w_1, w_2, \ldots, w_n)}\text{)}}} = \sum_{(w_1, w_2, \ldots, w_n) \in \mathfrak{A}^n} x_{w_1} x_{w_2} \cdots x_{w_n}.$$

Comparing this with (13.192.1), we obtain $\sum_{w \in \mathfrak{A}^n} \mathbf{x}_w = p_1^n$. This proves Lemma 13.192.3. □

Lemma 13.192.4. *We have*

$$\sum_{w \in \mathfrak{A}^*} \mathbf{x}_w t^{\ell(w)} = \frac{1}{1 - p_1 t} \qquad \text{in the ring } (\mathbf{k}[[\mathbf{x}]])[[t]].$$

Proof of Lemma 13.192.4. We have

$$\underbrace{\sum_{w \in \mathfrak{A}^*}}_{\substack{= \sum_{n \in \mathbb{N}} \sum_{w \in \mathfrak{A}^n} \\ \text{(since } \mathfrak{A}^* = \bigsqcup_{n \in \mathbb{N}} \mathfrak{A}^n\text{)}}} \mathbf{x}_w t^{\ell(w)} = \sum_{n \in \mathbb{N}} \sum_{w \in \mathfrak{A}^n} \mathbf{x}_w \underbrace{t^{\ell(w)}}_{\substack{= t^n \\ \text{(since } \ell(w) = n \\ \text{(since } w \in \mathfrak{A}^n\text{))}}} = \sum_{n \in \mathbb{N}} \underbrace{\sum_{w \in \mathfrak{A}^n} \mathbf{x}_w}_{\substack{= p_1^n \\ \text{(by Lemma 13.192.3)}}} t^n = \sum_{n \in \mathbb{N}} \underbrace{p_1^n t^n}_{= (p_1 t)^n}$$

$$= \sum_{n \in \mathbb{N}} (p_1 t)^n = \frac{1}{1 - p_1 t}.$$

This proves Lemma 13.192.4. □

Lemma 13.192.5. *We have*

$$\prod_{w \in \mathfrak{L}} \frac{1}{1 - \mathbf{x}_w t^{\ell(w)}} = \sum_{w \in \mathfrak{A}^*} \mathbf{x}_w t^{\ell(w)} \qquad \text{in the ring } (\mathbf{k}[[\mathbf{x}]])[[t]].$$

Proof of Lemma 13.192.5. Let $\mathfrak{M}$ denote the set of all finite multisets of Lyndon words. Define two maps $\mathbf{m} : \mathfrak{M} \to \mathfrak{A}^*$ and $\mathbf{n} : \mathfrak{A}^* \to \mathfrak{M}$ as in Proposition 13.143.1. Then, Proposition 13.143.1 shows that the maps $\mathbf{m}$ and $\mathbf{n}$ are mutually inverse bijections.

Recall that $\mathfrak{L}$ is the set of all Lyndon words. Thus, the Lyndon words are precisely the elements of $\mathfrak{L}$. But the definition of $\mathfrak{M}$ says that $\mathfrak{M}$ is the set of all finite multisets of Lyndon words. In other words, $\mathfrak{M}$ is the set of all finite multisets of elements of $\mathfrak{L}$ (since the Lyndon words are precisely the elements of $\mathfrak{L}$).

Let $\mathfrak{N}$ be the set of all families $(k_w)_{w \in \mathfrak{L}} \in \mathbb{N}^{\mathfrak{L}}$ of nonnegative integers (indexed by the Lyndon words) such that all but finitely many $w \in \mathfrak{L}$ satisfy $k_w = 0$. Thus,

$$\sum_{\substack{(k_w)_{w \in \mathfrak{L}} \in \mathbb{N}^{\mathfrak{L}}; \\ \text{all but finitely many } w \in \mathfrak{L} \\ \text{satisfy } k_w = 0}} = \sum_{(k_w)_{w \in \mathfrak{L}} \in \mathfrak{N}} \tag{13.192.2}$$

(an equality of summation signs). Proposition 13.143.2 (applied to $S = \mathfrak{L}$) shows that the map mult : $\mathfrak{M} \to \mathfrak{N}$ that sends each multiset $M \in \mathfrak{M}$ to the family

$$((\text{multiplicity of } w \text{ in the multiset } M))_{w \in \mathfrak{L}} \in \mathfrak{N}$$

is well-defined and is a bijection. Consider this map mult. Since mult : $\mathfrak{M} \to \mathfrak{N}$ is a bijection, its inverse $\text{mult}^{-1} : \mathfrak{N} \to \mathfrak{M}$ is well-defined and also a bijection.

For any $w \in \mathfrak{L}$, the monomial $t^{\ell(w)}$ has positive degree[1205]. Hence, for any $w \in \mathfrak{L}$, the formal power series $\frac{1}{1 - \mathbf{x}_w t^{\ell(w)}}$ is well-defined and satisfies the equality

$$\frac{1}{1 - \mathbf{x}_w t^{\ell(w)}} = \sum_{k \in \mathbb{N}} \left(\mathbf{x}_w t^{\ell(w)}\right)^k$$

[1205] *Proof.* Let $w \in \mathfrak{L}$. Thus, w is a Lyndon word (since $\mathfrak{L}$ is the set of all Lyndon words), therefore a nonempty word (since any Lyndon word is nonempty by definition). Hence, $\ell(w) > 0$. Therefore, the monomial $t^{\ell(w)}$ has positive degree. Qed.

(since $\dfrac{1}{1-q} = \sum_{k\in\mathbb{N}} q^k$ in the ring $\mathbf{k}[[q]]$ of formal power series).

Multiplying these equalities over all $w \in \mathfrak{L}$, we obtain

$$\begin{aligned}\prod_{w\in\mathfrak{L}} \frac{1}{1-\mathbf{x}_w t^{\ell(w)}} &= \prod_{w\in\mathfrak{L}} \sum_{k\in\mathbb{N}} \left(\mathbf{x}_w t^{\ell(w)}\right)^k \\ &= \sum_{\substack{(k_w)_{w\in\mathfrak{L}}\in\mathbb{N}^{\mathfrak{L}};\\ \text{all but finitely many } w\in\mathfrak{L}\\ \text{satisfy } k_w=0}} \prod_{w\in\mathfrak{L}} \left(\mathbf{x}_w t^{\ell(w)}\right)^{k_w} \qquad \text{(by the product rule)} \\ &= \sum_{(k_w)_{w\in\mathfrak{L}}\in\mathfrak{N}} \prod_{w\in\mathfrak{L}} \left(\mathbf{x}_w t^{\ell(w)}\right)^{k_w} \qquad \text{(by (13.192.2))}. \end{aligned} \tag{13.192.3}$$

The composition $\mathbf{m}\circ\operatorname{mult}^{-1} : \mathfrak{N} \to \mathfrak{A}^*$ of the bijections $\mathbf{m}$ and mult^{-1} is clearly a bijection. We now claim the following:

Claim 1: Let $(k_w)_{w\in\mathfrak{L}} \in \mathfrak{N}$. Then,

$$\mathbf{x}_{\left(\mathbf{m}\circ\operatorname{mult}^{-1}\right)\left((k_w)_{w\in\mathfrak{L}}\right)} t^{\ell\left(\left(\mathbf{m}\circ\operatorname{mult}^{-1}\right)\left((k_w)_{w\in\mathfrak{L}}\right)\right)} = \prod_{w\in\mathfrak{L}} \left(\mathbf{x}_w t^{\ell(w)}\right)^{k_w}.$$

[*Proof of Claim 1:* Let $M = \operatorname{mult}^{-1}\left((k_w)_{w\in\mathfrak{L}}\right)$. Then,

$$(k_w)_{w\in\mathfrak{L}} = \operatorname{mult} M = ((\text{multiplicity of } w \text{ in the multiset } M))_{w\in\mathfrak{L}}$$

(by the definition of the map mult). In other words, every $w \in \mathfrak{L}$ satisfies

$$k_w = (\text{multiplicity of } w \text{ in the multiset } M). \tag{13.192.4}$$

Moreover, $M = \operatorname{mult}^{-1}\left((k_w)_{w\in\mathfrak{L}}\right) \in \mathfrak{M}$. In other words, M is a finite multiset of elements of $\mathfrak{L}$ (since $\mathfrak{M}$ is the set of all finite multisets of elements of $\mathfrak{L}$). Let $a_1, a_2, \ldots, a_k$ denote the elements of this multiset M listed in decreasing order. Then, the definition of $\mathbf{m}$ yields $\mathbf{m}(M) = a_1 a_2 \cdots a_k$. Also, $a_1, a_2, \ldots, a_k$ are elements of M (by the definition of $a_1, a_2, \ldots, a_k$), and thus belong to $\mathfrak{L}$ (since M is a finite multiset of elements of $\mathfrak{L}$). In other words, every a_i belongs to $\mathfrak{L}$.

We have $M = \{a_1, a_2, \ldots, a_k\}_{\text{multiset}}$ (since $a_1, a_2, \ldots, a_k$ are the elements of the multiset M listed in decreasing order). Thus, each $w \in \mathfrak{L}$ satisfies

$$\begin{aligned}&\left(\text{multiplicity of } w \text{ in the multiset } \underbrace{M}_{=\{a_1,a_2,\ldots,a_k\}_{\text{multiset}}}\right) \\ &= \left(\text{multiplicity of } w \text{ in the multiset } \{a_1, a_2, \ldots, a_k\}_{\text{multiset}}\right) \\ &= (\text{the number of } i \in \{1, 2, \ldots, k\} \text{ satisfying } a_i = w).\end{aligned}$$

Hence, each $w \in \mathfrak{L}$ satisfies

$$\begin{aligned}&(\text{the number of } i \in \{1, 2, \ldots, k\} \text{ satisfying } a_i = w) \\ &= (\text{multiplicity of } w \text{ in the multiset } M) \\ &= k_w \qquad \text{(by (13.192.4))}.\end{aligned} \tag{13.192.5}$$

Now,

$$\begin{aligned}\ell\left(\underbrace{\mathbf{m}(M)}_{=a_1a_2\cdots a_k}\right) &= \ell(a_1a_2\cdots a_k) = \ell(a_1)+\ell(a_2)+\cdots+\ell(a_k)\\ &= \underbrace{\sum_{i\in\{1,2,\ldots,k\}}}_{\substack{=\sum_{w\in\mathfrak{L}}\sum_{i\in\{1,2,\ldots,k\};\ a_i=w}\\ \text{(since every } a_i \text{ belongs to } \mathfrak{L})}} \ell(a_i) = \sum_{w\in\mathfrak{L}}\sum_{\substack{i\in\{1,2,\ldots,k\};\\ a_i=w}} \ell\left(\underbrace{a_i}_{\substack{=w\\ (\text{since } a_i=w)}}\right)\\ &= \sum_{w\in\mathfrak{L}} \underbrace{\sum_{\substack{i\in\{1,2,\ldots,k\};\\ a_i=w}} \ell(w)}_{=(\text{the number of } i\in\{1,2,\ldots,k\} \text{ satisfying } a_i=w)\cdot\ell(w)}\\ &= \sum_{w\in\mathfrak{L}} \underbrace{(\text{the number of } i\in\{1,2,\ldots,k\} \text{ satisfying } a_i=w)}_{\substack{=k_w\\ (\text{by (13.192.5)})}}\cdot\ell(w)\\ &= \sum_{w\in\mathfrak{L}} k_w\cdot\ell(w).\end{aligned}$$

Hence,

$$t^{\ell(\mathbf{m}(M))} = t^{\sum_{w\in\mathfrak{L}} k_w\cdot\ell(w)} = \prod_{w\in\mathfrak{L}} \underbrace{t^{k_w\cdot\ell(w)}}_{=\left(t^{\ell(w)}\right)^{k_w}} = \prod_{w\in\mathfrak{L}} \left(t^{\ell(w)}\right)^{k_w}. \tag{13.192.6}$$

Moreover, from $\mathbf{m}(M) = a_1a_2\cdots a_k$, we obtain

$$\begin{aligned}\mathbf{x}_{\mathbf{m}(M)} &= \mathbf{x}_{a_1a_2\cdots a_k} = \mathbf{x}_{a_1}\mathbf{x}_{a_2}\cdots\mathbf{x}_{a_k} \qquad \text{(by Lemma 13.192.2)}\\ &= \underbrace{\prod_{i\in\{1,2,\ldots,k\}}}_{\substack{=\prod_{w\in\mathfrak{L}}\prod_{i\in\{1,2,\ldots,k\};\ a_i=w}\\ \text{(since every } a_i \text{ belongs to } \mathfrak{L})}} \mathbf{x}_{a_i} = \prod_{w\in\mathfrak{L}}\prod_{\substack{i\in\{1,2,\ldots,k\};\\ a_i=w}} \underbrace{\mathbf{x}_{a_i}}_{\substack{=\mathbf{x}_w\\ (\text{since } a_i=w)}}\\ &= \prod_{w\in\mathfrak{L}} \underbrace{\prod_{\substack{i\in\{1,2,\ldots,k\};\\ a_i=w}} \mathbf{x}_w}_{\substack{=\mathbf{x}_w^{(\text{the number of } i\in\{1,2,\ldots,k\} \text{ satisfying } a_i=w)}=\mathbf{x}_w^{k_w}\\ (\text{since (the number of } i\in\{1,2,\ldots,k\} \text{ satisfying } a_i=w)=k_w\\ (\text{by (13.192.5)})))}} = \prod_{w\in\mathfrak{L}} \mathbf{x}_w^{k_w}.\end{aligned}$$

Multiplying this equality by (13.192.6), we obtain

$$\mathbf{x}_{\mathbf{m}(M)} t^{\ell(\mathbf{m}(M))} = \left(\prod_{w\in\mathfrak{L}} \mathbf{x}_w^{k_w}\right)\prod_{w\in\mathfrak{L}}\left(t^{\ell(w)}\right)^{k_w} = \prod_{w\in\mathfrak{L}} \underbrace{\left(\mathbf{x}_w^{k_w}\left(t^{\ell(w)}\right)^{k_w}\right)}_{=\left(\mathbf{x}_w t^{\ell(w)}\right)^{k_w}} = \prod_{w\in\mathfrak{L}}\left(\mathbf{x}_w t^{\ell(w)}\right)^{k_w}.$$

In view of

$$\mathbf{m}\left(\underbrace{M}_{=\mathrm{mult}^{-1}\left((k_w)_{w\in\mathfrak{L}}\right)}\right) = \mathbf{m}\left(\mathrm{mult}^{-1}\left((k_w)_{w\in\mathfrak{L}}\right)\right) = \left(\mathbf{m}\circ\mathrm{mult}^{-1}\right)\left((k_w)_{w\in\mathfrak{L}}\right),$$

this rewrites as

$$\mathbf{x}_{\left(\mathbf{m}\circ\operatorname{mult}^{-1}\right)\left((k_w)_{w\in\mathfrak{L}}\right)} t^{\ell\left(\left(\mathbf{m}\circ\operatorname{mult}^{-1}\right)\left((k_w)_{w\in\mathfrak{L}}\right)\right)} = \prod_{w\in\mathfrak{L}} \left(\mathbf{x}_w t^{\ell(w)}\right)^{k_w}.$$

This proves Claim 1.]

Now, in the ring $(\mathbf{k}[[\mathbf{x}]])[[t]]$ of formal power series, we have

$$\begin{aligned}\sum_{w\in\mathfrak{A}^*} \mathbf{x}_w t^{\ell(w)} &= \sum_{k\in\mathfrak{N}} \mathbf{x}_{\left(\mathbf{m}\circ\operatorname{mult}^{-1}\right)(k)} t^{\ell\left(\left(\mathbf{m}\circ\operatorname{mult}^{-1}\right)(k)\right)} \\ &\qquad \left(\begin{array}{c}\text{here, we have substituted } \left(\mathbf{m}\circ\operatorname{mult}^{-1}\right)(k) \text{ for } w \text{ in the sum,} \\ \text{since the map } \mathbf{m}\circ\operatorname{mult}^{-1} : \mathfrak{N}\to\mathfrak{A}^* \text{ is a bijection}\end{array}\right) \\ &= \sum_{(k_w)_{w\in\mathfrak{L}}\in\mathfrak{N}} \underbrace{\mathbf{x}_{\left(\mathbf{m}\circ\operatorname{mult}^{-1}\right)\left((k_w)_{w\in\mathfrak{L}}\right)} t^{\ell\left(\left(\mathbf{m}\circ\operatorname{mult}^{-1}\right)\left((k_w)_{w\in\mathfrak{L}}\right)\right)}}_{\substack{=\prod_{w\in\mathfrak{L}}\left(\mathbf{x}_w t^{\ell(w)}\right)^{k_w} \\ \text{(by Claim 1)}}} \\ &\qquad \left(\begin{array}{c}\text{here, we have renamed the summation index } k \text{ as } (k_w)_{w\in\mathfrak{L}}, \\ \text{since each } k\in\mathfrak{N} \text{ is a family indexed by elements of } \mathfrak{L}\end{array}\right) \\ &= \sum_{(k_w)_{w\in\mathfrak{L}}\in\mathfrak{N}} \prod_{w\in\mathfrak{L}} \left(\mathbf{x}_w t^{\ell(w)}\right)^{k_w} \\ &= \prod_{w\in\mathfrak{L}} \frac{1}{1-\mathbf{x}_w t^{\ell(w)}} \qquad \text{(by (13.192.3))}.\end{aligned}$$

This proves Lemma 13.192.5. □

Proof of Proposition 6.6.39. Lemma 13.192.5 yields

$$\prod_{w\in\mathfrak{L}} \frac{1}{1-\mathbf{x}_w t^{\ell(w)}} = \sum_{w\in\mathfrak{A}^*} \mathbf{x}_w t^{\ell(w)} = \frac{1}{1-p_1 t}$$

(by Lemma 13.192.4). This proves Proposition 6.6.39. □

Our next step is to show the following lemma (similar to Lemma 13.192.5):

Lemma 13.192.6. *In the power series ring* $\mathbf{k}[[\mathbf{x},\mathbf{y}]]$, *we have*

$$\prod_{w\in\mathfrak{L}} \frac{1}{1-\mathbf{x}_w p_{\ell(w)}(\mathbf{y})} = \sum_{w\in\mathfrak{A}^*} \mathbf{x}_w p_{\operatorname{CFLtype} w}(\mathbf{y}).$$

Proof of Lemma 13.192.6. Let $\mathfrak{M}$ denote the set of all finite multisets of Lyndon words. Define two maps $\mathbf{m}:\mathfrak{M}\to\mathfrak{A}^*$ and $\mathbf{n}:\mathfrak{A}^*\to\mathfrak{M}$ as in Proposition 13.143.1. Then, Proposition 13.143.1 shows that the maps $\mathbf{m}$ and $\mathbf{n}$ are mutually inverse bijections.

Recall that $\mathfrak{L}$ is the set of all Lyndon words. Thus, the Lyndon words are precisely the elements of $\mathfrak{L}$. But the definition of $\mathfrak{M}$ says that $\mathfrak{M}$ is the set of all finite multisets of Lyndon words. In other words, $\mathfrak{M}$ is the set of all finite multisets of elements of $\mathfrak{L}$ (since the Lyndon words are precisely the elements of $\mathfrak{L}$).

Let $\mathfrak{N}$ be the set of all families $(k_w)_{w\in\mathfrak{L}}\in\mathbb{N}^{\mathfrak{L}}$ of nonnegative integers (indexed by the Lyndon words) such that all but finitely many $w\in\mathfrak{L}$ satisfy $k_w=0$. Thus,

$$(13.192.7) \qquad \sum_{\substack{(k_w)_{w\in\mathfrak{L}}\in\mathbb{N}^{\mathfrak{L}}; \\ \text{all but finitely many } w\in\mathfrak{L} \\ \text{satisfy } k_w=0}} = \sum_{(k_w)_{w\in\mathfrak{L}}\in\mathfrak{N}}$$

(an equality of summation signs). Proposition 13.143.2 (applied to $S=\mathfrak{L}$) shows that the map $\operatorname{mult}:\mathfrak{M}\to\mathfrak{N}$ that sends each multiset $M\in\mathfrak{M}$ to the family

$$\left((\text{multiplicity of } w \text{ in the multiset } M)\right)_{w\in\mathfrak{L}}\in\mathfrak{N}$$

is well-defined and is a bijection. Consider this map mult. Since $\operatorname{mult}:\mathfrak{M}\to\mathfrak{N}$ is a bijection, its inverse $\operatorname{mult}^{-1}:\mathfrak{N}\to\mathfrak{M}$ is well-defined and also a bijection.

For any $w \in \mathfrak{L}$, the power series $\mathbf{x}_w p_{\ell(w)}(\mathbf{y})$ is homogeneous of positive degree[1206]. Hence, for any $w \in \mathfrak{L}$, the formal power series $\dfrac{1}{1 - \mathbf{x}_w p_{\ell(w)}(\mathbf{y})}$ is well-defined and satisfies the equality

$$\frac{1}{1 - \mathbf{x}_w p_{\ell(w)}(\mathbf{y})} = \sum_{k \in \mathbb{N}} \left(\mathbf{x}_w p_{\ell(w)}(\mathbf{y})\right)^k$$

(since $\dfrac{1}{1-q} = \sum_{k \in \mathbb{N}} q^k$ in the ring $\mathbf{k}[[q]]$ of formal power series).

Multiplying these equalities over all $w \in \mathfrak{L}$, we obtain

$$\begin{aligned} \prod_{w \in \mathfrak{L}} \frac{1}{1 - \mathbf{x}_w p_{\ell(w)}(\mathbf{y})} &= \prod_{w \in \mathfrak{L}} \sum_{k \in \mathbb{N}} \left(\mathbf{x}_w p_{\ell(w)}(\mathbf{y})\right)^k \\ &= \sum_{\substack{(k_w)_{w \in \mathfrak{L}} \in \mathbb{N}^{\mathfrak{L}};\\ \text{all but finitely many } w \in \mathfrak{L} \\ \text{satisfy } k_w = 0}} \prod_{w \in \mathfrak{L}} \left(\mathbf{x}_w p_{\ell(w)}(\mathbf{y})\right)^{k_w} \qquad \text{(by the product rule)} \\ &= \sum_{(k_w)_{w \in \mathfrak{L}} \in \mathfrak{N}} \prod_{w \in \mathfrak{L}} \left(\mathbf{x}_w p_{\ell(w)}(\mathbf{y})\right)^{k_w} \qquad \text{(by (13.192.7))}. \end{aligned} \tag{13.192.8}$$

The composition $\mathbf{m} \circ \operatorname{mult}^{-1} : \mathfrak{N} \to \mathfrak{A}^*$ of the bijections $\mathbf{m}$ and mult^{-1} is clearly a bijection. We now claim the following:

Claim 1: Let $w \in \mathfrak{A}^*$. For each $v \in \mathfrak{L}$, let $k_v \in \mathbb{N}$ be such that

$$k_v = (\text{multiplicity of } v \text{ in the multiset } \mathbf{n}(w)). \tag{13.192.9}$$

Then,

$$p_{\operatorname{CFLtype} w} = \prod_{v \in \mathfrak{L}} p_{\ell(v)}^{k_v}.$$

[*Proof of Claim 1:* Let $(a_1, a_2, \ldots, a_k)$ be the CFL factorization of w. Then, the definition of the map $\mathbf{n}$ yields $\mathbf{n}(w) = \{a_1, a_2, \ldots, a_k\}_{\text{multiset}}$. Now, for each $v \in \mathfrak{L}$, we have

$$\begin{aligned} k_v &= (\text{multiplicity of } v \text{ in the multiset } \mathbf{n}(w)) \qquad \text{(by (13.192.9))} \\ &= (\text{multiplicity of } v \text{ in the multiset } \{a_1, a_2, \ldots, a_k\}_{\text{multiset}}) \\ &\qquad (\text{since } \mathbf{n}(w) = \{a_1, a_2, \ldots, a_k\}_{\text{multiset}}) \\ &= (\text{the number of all } i \in \{1, 2, \ldots, k\} \text{ such that } a_i = v). \end{aligned} \tag{13.192.10}$$

Recall that $(a_1, a_2, \ldots, a_k)$ is the CFL factorization of w. In other words, $(a_1, a_2, \ldots, a_k)$ is a tuple of Lyndon words satisfying $w = a_1 a_2 \cdots a_k$ and $a_1 \geq a_2 \geq \cdots \geq a_k$ (by the definition of "CFL factorization"). Thus, in particular, $(a_1, a_2, \ldots, a_k)$ is a tuple of Lyndon words, i.e., a tuple of elements of $\mathfrak{L}$ (since the Lyndon words are precisely the elements of $\mathfrak{L}$). In other words, $a_i \in \mathfrak{L}$ for each $i \in \{1, 2, \ldots, k\}$.

Let us make a general observation about partitions: If $b_1, b_2, \ldots, b_k$ are any k positive integers, and if μ is the partition whose parts are the positive integers $b_1, b_2, \ldots, b_k$ (listed in decreasing order), then

$$p_\lambda = p_{b_1} p_{b_2} \cdots p_{b_k}. \tag{13.192.11}$$

(Indeed, this follows from the definition of p_λ in Definition 2.2.1, since multiplication in Λ is commutative.)

[1206] *Proof.* Let $w \in \mathfrak{L}$. Thus, w is a Lyndon word (since $\mathfrak{L}$ is the set of all Lyndon words), therefore a nonempty word (since any Lyndon word is nonempty by definition). In other words, $w \in \mathfrak{A}^n$ for some positive integer n. Consider this n. From $w \in \mathfrak{A}^n$, we obtain $w = (w_1, w_2, \ldots, w_n)$, so that $\mathbf{x}_w = x_{w_1} x_{w_2} \cdots x_{w_n}$ (by the definition of $\mathbf{x}_w$). Hence, $\mathbf{x}_w$ is a monomial of degree n. Hence, the power series $\mathbf{x}_w$ is homogeneous of degree n. Moreover, $w \in \mathfrak{A}^n$ entails $\ell(w) = n$. Hence, $p_{\ell(w)} = p_n = x_1^n + x_2^n + x_3^n + \cdots$ (by the definition of p_n, since n is a positive integer). Substituting $y_1, y_2, y_3, \ldots$ for $x_1, x_2, x_3, \ldots$ in this equality, we find $p_{\ell(w)}(\mathbf{y}) = y_1^n + y_2^n + y_3^n + \cdots$. Thus, the power series $p_{\ell(w)}(\mathbf{y})$ is homogeneous of degree n.

We now know that the power series $\mathbf{x}_w$ and $p_{\ell(w)}(\mathbf{y})$ are both homogeneous of degree n. Hence, their product $\mathbf{x}_w p_{\ell(w)}(\mathbf{y})$ is homogeneous of degree $n + n$. Since $n + n = 2n$ is positive (because n is positive), this shows that $\mathbf{x}_w p_{\ell(w)}(\mathbf{y})$ is homogeneous of positive degree. Qed.

Now, recall again that $(a_1, a_2, \ldots, a_k)$ is the CFL factorization of w. Hence, $\operatorname{CFLtype} w$ is the partition whose parts are the positive integers $\ell(a_1), \ell(a_2), \ldots, \ell(a_k)$ (listed in decreasing order)[1207]. Hence, (13.192.11) (applied to $b_i = a_i$ and $\mu = \operatorname{CFLtype} w$) yields

$$\begin{aligned} p_{\operatorname{CFLtype} w} &= p_{\ell(a_1)} p_{\ell(a_2)} \cdots p_{\ell(a_k)} = \underbrace{\prod_{i\in\{1,2,\ldots,k\}}}_{\substack{=\prod_{v\in\mathfrak{L}} \prod_{i\in\{1,2,\ldots,k\};\ a_i=v} \\ (\text{since } a_i\in\mathfrak{L} \text{ for each } i\in\{1,2,\ldots,k\})}} p_{\ell(a_i)} \\ &= \prod_{v\in\mathfrak{L}} \prod_{\substack{i\in\{1,2,\ldots,k\};\\ a_i=v}} \underbrace{p_{\ell(a_i)}}_{\substack{=p_{\ell(v)} \\ (\text{since } a_i=v)}} = \prod_{v\in\mathfrak{L}} \underbrace{\prod_{\substack{i\in\{1,2,\ldots,k\};\\ a_i=v}} p_{\ell(v)}}_{\substack{=p_{\ell(v)}^{(\text{the number of all } i\in\{1,2,\ldots,k\} \text{ such that } a_i=v)} = p_{\ell(v)}^{k_v} \\ (\text{since (the number of all } i\in\{1,2,\ldots,k\} \text{ such that } a_i=v)=k_v \\ (\text{by } (13.192.10)))}} \\ &= \prod_{v\in\mathfrak{L}} p_{\ell(v)}^{k_v}. \end{aligned}$$

This proves Claim 1.]

Claim 2: Let $(k_w)_{w\in\mathfrak{L}} \in \mathfrak{N}$. Then,

$$\mathbf{x}_{(\mathbf{m}\circ\operatorname{mult}^{-1})((k_w)_{w\in\mathfrak{L}})} p_{\operatorname{CFLtype}((\mathbf{m}\circ\operatorname{mult}^{-1})((k_w)_{w\in\mathfrak{L}}))}(\mathbf{y}) = \prod_{w\in\mathfrak{L}} \left(\mathbf{x}_w p_{\ell(w)}(\mathbf{y})\right)^{k_w}.$$

[*Proof of Claim 2:* Let $M = \operatorname{mult}^{-1}\left((k_w)_{w\in\mathfrak{L}}\right)$. Then,

$$(k_w)_{w\in\mathfrak{L}} = \operatorname{mult} M = ((\text{multiplicity of } w \text{ in the multiset } M))_{w\in\mathfrak{L}}$$

(by the definition of the map mult). In other words, every $w \in \mathfrak{L}$ satisfies

$$k_w = (\text{multiplicity of } w \text{ in the multiset } M).$$

Renaming w as v in this result, we obtain the following: Every $v \in \mathfrak{L}$ satisfies

$$k_v = (\text{multiplicity of } v \text{ in the multiset } M). \tag{13.192.12}$$

Moreover, $M = \operatorname{mult}^{-1}\left((k_w)_{w\in\mathfrak{L}}\right) \in \mathfrak{M}$. In other words, M is a finite multiset of elements of $\mathfrak{L}$ (since $\mathfrak{M}$ is the set of all finite multisets of elements of $\mathfrak{L}$). Let $a_1, a_2, \ldots, a_k$ denote the elements of this multiset M listed in decreasing order. Then, the definition of $\mathbf{m}$ yields $\mathbf{m}(M) = a_1 a_2 \cdots a_k$. Also, $a_1, a_2, \ldots, a_k$ are elements of M (by the definition of $a_1, a_2, \ldots, a_k$), and thus belong to $\mathfrak{L}$ (since M is a finite multiset of elements of $\mathfrak{L}$). In other words, every a_i belongs to $\mathfrak{L}$.

Each $w \in \mathfrak{L}$ satisfies

$$(\text{the number of } i \in \{1, 2, \ldots, k\} \text{ satisfying } a_i = w) = k_w. \tag{13.192.13}$$

(Indeed, this is precisely the equality (13.192.5) from the proof of Claim 1 in the proof of Lemma 13.192.5; and it can be proved in the exact same way as the latter equality.)

Now, recall that the maps $\mathbf{m}$ and $\mathbf{n}$ are mutually inverse. Hence, $\mathbf{n} \circ \mathbf{m} = \operatorname{id}$. Thus, $\mathbf{n}(\mathbf{m}(M)) = \underbrace{(\mathbf{n} \circ \mathbf{m})}_{=\operatorname{id}}(M) = \operatorname{id}(M) = M$. In other words, $M = \mathbf{n}(\mathbf{m}(M))$. Now, every $v \in \mathfrak{L}$ satisfies

$$\begin{aligned} k_v &= \left(\text{multiplicity of } v \text{ in the multiset } \underbrace{M}_{=\mathbf{n}(\mathbf{m}(M))}\right) \qquad (\text{by } (13.192.12)) \\ &= (\text{multiplicity of } v \text{ in the multiset } \mathbf{n}(\mathbf{m}(M))). \end{aligned}$$

Thus, Claim 1 (applied to $w = \mathbf{m}(M)$) yields

$$p_{\operatorname{CFLtype}(\mathbf{m}(M))} = \prod_{v\in\mathfrak{L}} p_{\ell(v)}^{k_v} = \prod_{w\in\mathfrak{L}} p_{\ell(w)}^{k_w}$$

[1207] by the definition of $\operatorname{CFLtype} w$

(here, we have renamed the index v as w in the product). Substituting the variables $\mathbf{y} = (y_1, y_2, y_3, \ldots)$ for $\mathbf{x} = (x_1, x_2, x_3, \ldots)$ on both sides of this equality, we obtain

$$p_{\mathrm{CFLtype}(\mathbf{m}(M))}(\mathbf{y}) = \left(\prod_{w\in\mathfrak{L}} p_{\ell(w)}^{k_w}\right)(\mathbf{y}) = \prod_{w\in\mathfrak{L}} \left(p_{\ell(w)}(\mathbf{y})\right)^{k_w}. \tag{13.192.14}$$

Moreover, from $\mathbf{m}(M) = a_1 a_2 \cdots a_k$, we obtain

$$\begin{aligned}
\mathbf{x}_{\mathbf{m}(M)} &= \mathbf{x}_{a_1 a_2 \cdots a_k} = \mathbf{x}_{a_1}\mathbf{x}_{a_2}\cdots\mathbf{x}_{a_k} \qquad (\text{by Lemma 13.192.2})\\
&= \underbrace{\prod_{i\in\{1,2,\ldots,k\}}}_{\substack{=\prod_{w\in\mathfrak{L}}\prod_{i\in\{1,2,\ldots,k\};\ a_i=w}\\ (\text{since every } a_i \text{ belongs to } \mathfrak{L})}} \mathbf{x}_{a_i} = \prod_{w\in\mathfrak{L}}\prod_{\substack{i\in\{1,2,\ldots,k\};\\ a_i=w}} \underbrace{\mathbf{x}_{a_i}}_{\substack{=\mathbf{x}_w\\ (\text{since } a_i=w)}}\\
&= \prod_{w\in\mathfrak{L}} \underbrace{\prod_{\substack{i\in\{1,2,\ldots,k\};\\ a_i=w}} \mathbf{x}_w}_{\substack{=\mathbf{x}_w^{(\text{the number of } i\in\{1,2,\ldots,k\} \text{ satisfying } a_i=w)}=\mathbf{x}_w^{k_w}\\ (\text{since (the number of } i\in\{1,2,\ldots,k\} \text{ satisfying } a_i=w)=k_w\\ (\text{by (13.192.13)}))}}\\
&= \prod_{w\in\mathfrak{L}} \mathbf{x}_w^{k_w}.
\end{aligned}$$

Multiplying this equality by (13.192.14), we obtain

$$\begin{aligned}
\mathbf{x}_{\mathbf{m}(M)} p_{\mathrm{CFLtype}(\mathbf{m}(M))}(\mathbf{y}) &= \left(\prod_{w\in\mathfrak{L}} \mathbf{x}_w^{k_w}\right) \prod_{w\in\mathfrak{L}} \left(p_{\ell(w)}(\mathbf{y})\right)^{k_w} = \prod_{w\in\mathfrak{L}} \underbrace{\left(\mathbf{x}_w^{k_w}\left(p_{\ell(w)}(\mathbf{y})\right)^{k_w}\right)}_{=\left(\mathbf{x}_w p_{\ell(w)}(\mathbf{y})\right)^{k_w}}\\
&= \prod_{w\in\mathfrak{L}} \left(\mathbf{x}_w p_{\ell(w)}(\mathbf{y})\right)^{k_w}.
\end{aligned}$$

In view of

$$\mathbf{m}\left(\underbrace{M}_{=\mathrm{mult}^{-1}\left((k_w)_{w\in\mathfrak{L}}\right)}\right) = \mathbf{m}\left(\mathrm{mult}^{-1}\left((k_w)_{w\in\mathfrak{L}}\right)\right) = \left(\mathbf{m}\circ\mathrm{mult}^{-1}\right)\left((k_w)_{w\in\mathfrak{L}}\right),$$

this rewrites as

$$\mathbf{x}_{\left(\mathbf{m}\circ\mathrm{mult}^{-1}\right)\left((k_w)_{w\in\mathfrak{L}}\right)} p_{\mathrm{CFLtype}\left(\left(\mathbf{m}\circ\mathrm{mult}^{-1}\right)\left((k_w)_{w\in\mathfrak{L}}\right)\right)}(\mathbf{y}) = \prod_{w\in\mathfrak{L}} \left(\mathbf{x}_w p_{\ell(w)}(\mathbf{y})\right)^{k_w}.$$

This proves Claim 2.]

Now, in the ring $\mathbf{k}[[\mathbf{x},\mathbf{y}]]$ of formal power series, we have

$$\begin{aligned}
\sum_{w\in\mathfrak{A}^*} \mathbf{x}_w p_{\operatorname{CFLtype} w}(\mathbf{y}) &= \sum_{k\in\mathfrak{N}} \mathbf{x}_{\left(\mathbf{m}\circ\operatorname{mult}^{-1}\right)(k)} p_{\operatorname{CFLtype}\left(\left(\mathbf{m}\circ\operatorname{mult}^{-1}\right)(k)\right)}(\mathbf{y}) \\
&\qquad \left(\begin{array}{c}\text{here, we have substituted } \left(\mathbf{m}\circ\operatorname{mult}^{-1}\right)(k) \text{ for } w \text{ in the sum,} \\ \text{since the map } \mathbf{m}\circ\operatorname{mult}^{-1} : \mathfrak{N}\to\mathfrak{A}^* \text{ is a bijection}\end{array}\right) \\
&= \sum_{(k_w)_{w\in\mathfrak{L}}\in\mathfrak{N}} \underbrace{\mathbf{x}_{\left(\mathbf{m}\circ\operatorname{mult}^{-1}\right)\left((k_w)_{w\in\mathfrak{L}}\right)} p_{\operatorname{CFLtype}\left(\left(\mathbf{m}\circ\operatorname{mult}^{-1}\right)\left((k_w)_{w\in\mathfrak{L}}\right)\right)}(\mathbf{y})}_{\substack{=\prod_{w\in\mathfrak{L}}\left(\mathbf{x}_w p_{\ell(w)}(\mathbf{y})\right)^{k_w} \\ \text{(by Claim 2)}}} \\
&\qquad \left(\begin{array}{c}\text{here, we have renamed the summation index } k \text{ as } (k_w)_{w\in\mathfrak{L}}, \\ \text{since each } k\in\mathfrak{N} \text{ is a family indexed by elements of } \mathfrak{L}\end{array}\right) \\
&= \sum_{(k_w)_{w\in\mathfrak{L}}\in\mathfrak{N}} \prod_{w\in\mathfrak{L}} \left(\mathbf{x}_w p_{\ell(w)}(\mathbf{y})\right)^{k_w} \\
&= \prod_{w\in\mathfrak{L}} \frac{1}{1-\mathbf{x}_w p_{\ell(w)}(\mathbf{y})} \qquad \text{(by (13.192.8))}.
\end{aligned}$$

This proves Lemma 13.192.6. □

The following lemma is a slight restatement of Lemma 13.192.6:

Lemma 13.192.7. *Consider the power series ring $\mathbf{k}[[\mathbf{x},\mathbf{y}]]$. For each word $w=(w_1,w_2,\ldots,w_n)\in\mathfrak{A}^n$, we define a monomial $\mathbf{y}_w$ in $\mathbf{k}[[\mathbf{y}]]$ by $\mathbf{y}_w = y_{w_1}y_{w_2}\cdots y_{w_n}$. Then,*

$$\prod_{w\in\mathfrak{L}}\prod_{u\in\mathfrak{L}} \frac{1}{1-\mathbf{x}_w^{\ell(u)}\mathbf{y}_u^{\ell(w)}} = \sum_{w\in\mathfrak{A}^*} \mathbf{x}_w p_{\operatorname{CFLtype} w}(\mathbf{y}).$$

Proof of Lemma 13.192.7. Lemma 13.192.6 yields

$$\prod_{w\in\mathfrak{L}} \frac{1}{1-\mathbf{x}_w p_{\ell(w)}(\mathbf{y})} = \sum_{w\in\mathfrak{A}^*} \mathbf{x}_w p_{\operatorname{CFLtype} w}(\mathbf{y}). \tag{13.192.15}$$

Proposition 6.6.39 yields

$$\frac{1}{1-p_1 t} = \prod_{w\in\mathfrak{L}} \frac{1}{1-\mathbf{x}_w t^{\ell(w)}}. \tag{13.192.16}$$

Now, fix $v\in\mathfrak{L}$. Then, v is a Lyndon word (since $\mathfrak{L}$ is the set of all Lyndon words), and thus is nonempty (since any Lyndon word is nonempty). Hence, $\ell(v)\geq 1$. Thus, the definition of $p_{\ell(v)}$ yields $p_{\ell(v)} = x_1^{\ell(v)} + x_2^{\ell(v)} + x_3^{\ell(v)} + \cdots$. Substituting the variables $\mathbf{y}=(y_1,y_2,y_3,\ldots)$ for $\mathbf{x}=(x_1,x_2,x_3,\ldots)$ on both sides of this equality, we obtain

$$p_{\ell(v)}(\mathbf{y}) = y_1^{\ell(v)} + y_2^{\ell(v)} + y_3^{\ell(v)} + \cdots. \tag{13.192.17}$$

On the other hand, the definition of p_1 yields $p_1 = x_1^1 + x_2^1 + x_3^1 + \cdots = x_1 + x_2 + x_3 + \cdots$. Substituting $y_1^{\ell(v)}, y_2^{\ell(v)}, y_3^{\ell(v)}, \ldots$ for $x_1,x_2,x_3,\ldots$ on both sides of this equality, we obtain

$$p_1\left(y_1^{\ell(v)}, y_2^{\ell(v)}, y_3^{\ell(v)}, \ldots\right) = y_1^{\ell(v)} + y_2^{\ell(v)} + y_3^{\ell(v)} + \cdots.$$

Comparing this with (13.192.17), we obtain

$$p_1\left(y_1^{\ell(v)}, y_2^{\ell(v)}, y_3^{\ell(v)}, \ldots\right) = p_{\ell(v)}(\mathbf{y}). \tag{13.192.18}$$

Every $k\in\mathbb{N}$ and every word $w\in\mathfrak{A}^*$ satisfy

$$\mathbf{x}_w\left(y_1^k, y_2^k, y_3^k, \ldots\right) = \mathbf{y}_w^k \tag{13.192.19}$$

(where, of course, $\mathbf{x}_w\left(y_1^k, y_2^k, y_3^k, \ldots\right)$ denotes the result of substituting $y_1^k, y_2^k, y_3^k, \ldots$ for $x_1,x_2,x_3,\ldots$ in the polynomial $\mathbf{x}_w$).

[*Proof of (13.192.19):* Let $k\in\mathbb{N}$. Let $w\in\mathfrak{A}^*$ be a word. Write the word w in the form $w=(w_1,w_2,\ldots,w_n)$. Then, $\mathbf{x}_w = x_{w_1}x_{w_2}\cdots x_{w_n}$ (by the definition of $\mathbf{x}_w$) and $\mathbf{y}_w = y_{w_1}y_{w_2}\cdots y_{w_n}$ (by the definition of $\mathbf{y}_w$), so that $y_{w_1}y_{w_2}\cdots y_{w_n} = \mathbf{y}_w$. Now, substituting $y_1^k, y_2^k, y_3^k, \ldots$ for $x_1, x_2, x_3, \ldots$ on both sides of the equality $\mathbf{x}_w = x_{w_1}x_{w_2}\cdots x_{w_n}$, we obtain

$$\mathbf{x}_w\left(y_1^k, y_2^k, y_3^k, \ldots\right) = y_{w_1}^k y_{w_2}^k \cdots y_{w_n}^k = \left(\underbrace{y_{w_1}y_{w_2}\cdots y_{w_n}}_{=\mathbf{y}_w}\right)^k = \mathbf{y}_w^k.$$

This proves (13.192.19).]

Furthermore, the monomial $\mathbf{x}_v$ has positive degree[1208].

The equality (13.192.16) is an equality of formal power series in $(\mathbf{k}[[\mathbf{x}]])[[t]] = \mathbf{k}[[x_1, x_2, x_3, \ldots, t]]$. Substituting $y_1^{\ell(v)}, y_2^{\ell(v)}, y_3^{\ell(v)}, \ldots$ for $x_1, x_2, x_3, \ldots$ on both sides of this equality (while keeping t unchanged for now), we obtain

$$\begin{aligned}\frac{1}{1-p_1\left(y_1^{\ell(v)}, y_2^{\ell(v)}, y_3^{\ell(v)}, \ldots\right)t} &= \prod_{w\in\mathfrak{L}} \underbrace{\frac{1}{1-\mathbf{x}_w\left(y_1^{\ell(v)}, y_2^{\ell(v)}, y_3^{\ell(v)}, \ldots\right)t^{\ell(w)}}}_{\substack{=\dfrac{1}{1-\mathbf{y}_w^{\ell(v)}t^{\ell(w)}} \\ \text{(since } \mathbf{x}_w\left(y_1^{\ell(v)}, y_2^{\ell(v)}, y_3^{\ell(v)}, \ldots\right)=\mathbf{y}_w^{\ell(v)} \\ \text{(by (13.192.19), applied to } k=\ell(v)\text{)})}} \\ &= \prod_{w\in\mathfrak{L}} \frac{1}{1-\mathbf{y}_w^{\ell(v)}t^{\ell(w)}} = \prod_{u\in\mathfrak{L}} \frac{1}{1-\mathbf{y}_u^{\ell(v)}t^{\ell(u)}}\end{aligned}$$

(here, we have renamed the index w as u in the product). In view of (13.192.18), this rewrites as

$$\frac{1}{1-p_{\ell(v)}(\mathbf{y})\,t} = \prod_{u\in\mathfrak{L}} \frac{1}{1-\mathbf{y}_u^{\ell(v)}t^{\ell(u)}}.$$

This is an equality of formal power series in $(\mathbf{k}[[\mathbf{y}]])[[t]]$. We can substitute $\mathbf{x}_v$ for t in this equality (since the monomial $\mathbf{x}_v$ has positive degree), and thus obtain the equality

$$\frac{1}{1-p_{\ell(v)}(\mathbf{y})\,\mathbf{x}_v} = \prod_{u\in\mathfrak{L}} \frac{1}{1-\mathbf{y}_u^{\ell(v)}\mathbf{x}_v^{\ell(u)}} \tag{13.192.20}$$

in the ring $\mathbf{k}[[\mathbf{x}, \mathbf{y}]]$.

Now, forget that we fixed v. We thus have proved the equality (13.192.20) for each $v \in \mathfrak{L}$.

Now,

$$\begin{aligned}\prod_{w\in\mathfrak{L}} \underbrace{\frac{1}{1-\mathbf{x}_w p_{\ell(w)}(\mathbf{y})}}_{\substack{=\dfrac{1}{1-p_{\ell(w)}(\mathbf{y})\,\mathbf{x}_w} \\ \text{(since } \mathbf{x}_w p_{\ell(w)}(\mathbf{y}) = p_{\ell(w)}(\mathbf{y})\mathbf{x}_w\text{)}}} &= \prod_{w\in\mathfrak{L}} \underbrace{\frac{1}{1-p_{\ell(w)}(\mathbf{y})\,\mathbf{x}_w}}_{\substack{=\prod_{u\in\mathfrak{L}}\dfrac{1}{1-\mathbf{y}_u^{\ell(w)}\mathbf{x}_w^{\ell(u)}} \\ \text{(by (13.192.20), applied to } v=w\text{)}}} \\ &= \prod_{w\in\mathfrak{L}} \prod_{u\in\mathfrak{L}} \underbrace{\frac{1}{1-\mathbf{y}_u^{\ell(w)}\mathbf{x}_w^{\ell(u)}}}_{\substack{=\dfrac{1}{1-\mathbf{x}_w^{\ell(u)}\mathbf{y}_u^{\ell(w)}} \\ \text{(since } \mathbf{y}_u^{\ell(w)}\mathbf{x}_w^{\ell(u)} = \mathbf{x}_w^{\ell(u)}\mathbf{y}_u^{\ell(w)}\text{)}}} = \prod_{w\in\mathfrak{L}} \prod_{u\in\mathfrak{L}} \frac{1}{1-\mathbf{x}_w^{\ell(u)}\mathbf{y}_u^{\ell(w)}}.\end{aligned}$$

Comparing this with (13.192.15), we obtain

$$\prod_{w\in\mathfrak{L}} \prod_{u\in\mathfrak{L}} \frac{1}{1-\mathbf{x}_w^{\ell(u)}\mathbf{y}_u^{\ell(w)}} = \sum_{w\in\mathfrak{A}^*} \mathbf{x}_w p_{\operatorname{CFLtype} w}(\mathbf{y}).$$

This proves Lemma 13.192.7. □

[1208] *Proof.* Write the word v in the form $v = (v_1, v_2, \ldots, v_n)$. Then, $n = \ell(v) \geq 1$. Hence, n is positive. But the definition of $\mathbf{x}_v$ yields $\mathbf{x}_v = x_{v_1}x_{v_2}\cdots x_{v_n}$ (since $v = (v_1, v_2, \ldots, v_n)$). Hence, the monomial $\mathbf{x}_v$ has degree n. Thus, the monomial $\mathbf{x}_v$ has positive degree (since n is positive).

Now, we can prove Proposition 6.6.38:

Proof of Proposition 6.6.38. Define a monomial $\mathbf{y}_w$ for each word w as in Proposition 6.6.38(b). We have

$$\sum_{\lambda\in\operatorname{Par}} \underbrace{\mathbf{GR}_\lambda(\mathbf{x})}_{\substack{=\sum_{w\in\mathfrak{A}^*;\ \operatorname{CFLtype} w=\lambda} \mathbf{x}_w \\ \text{(by the definition of } \mathbf{GR}_\lambda)}} p_\lambda(\mathbf{y}) = \sum_{\lambda\in\operatorname{Par}} \sum_{\substack{w\in\mathfrak{A}^*;\\ \operatorname{CFLtype} w=\lambda}} \mathbf{x}_w \underbrace{p_\lambda(\mathbf{y})}_{\substack{=p_{\operatorname{CFLtype} w}(\mathbf{y}) \\ (\text{since } \lambda=\operatorname{CFLtype} w)}}$$

$$= \underbrace{\sum_{\lambda\in\operatorname{Par}} \sum_{\substack{w\in\mathfrak{A}^*;\\ \operatorname{CFLtype} w=\lambda}}}_{\substack{=\sum_{w\in\mathfrak{A}^*} \\ (\text{since } \operatorname{CFLtype} w\in\operatorname{Par} \\ \text{for each } w\in\mathfrak{A}^*)}} \mathbf{x}_w p_{\operatorname{CFLtype} w}(\mathbf{y})$$

$$= \sum_{w\in\mathfrak{A}^*} \mathbf{x}_w p_{\operatorname{CFLtype} w}(\mathbf{y}) \tag{13.192.21}$$

$$= \prod_{w\in\mathfrak{L}} \prod_{u\in\mathfrak{L}} \frac{1}{1-\mathbf{x}_w^{\ell(u)}\mathbf{y}_u^{\ell(w)}} \tag{13.192.22}$$

(by Lemma 13.192.7).

The same argument (but with the roles of the sets of variables $\mathbf{x}=(x_1,x_2,x_3,\ldots)$ and $\mathbf{y}=(y_1,y_2,y_3,\ldots)$ interchanged) yields

$$\sum_{\lambda\in\operatorname{Par}} \mathbf{GR}_\lambda(\mathbf{y})\, p_\lambda(\mathbf{x}) = \prod_{w\in\mathfrak{L}} \prod_{u\in\mathfrak{L}} \frac{1}{1-\mathbf{y}_w^{\ell(u)}\mathbf{x}_u^{\ell(w)}}.$$

Hence,

$$\sum_{\lambda\in\operatorname{Par}} \underbrace{p_\lambda(\mathbf{x})\,\mathbf{GR}_\lambda(\mathbf{y})}_{=\mathbf{GR}_\lambda(\mathbf{y})p_\lambda(\mathbf{x})}$$

$$= \sum_{\lambda\in\operatorname{Par}} \mathbf{GR}_\lambda(\mathbf{y})\, p_\lambda(\mathbf{x}) = \prod_{w\in\mathfrak{L}} \prod_{u\in\mathfrak{L}} \frac{1}{1-\mathbf{y}_w^{\ell(u)}\mathbf{x}_u^{\ell(w)}} = \underbrace{\prod_{u\in\mathfrak{L}} \prod_{w\in\mathfrak{L}}}_{=\prod_{w\in\mathfrak{L}}\prod_{u\in\mathfrak{L}}} \underbrace{\frac{1}{1-\mathbf{y}_u^{\ell(w)}\mathbf{x}_w^{\ell(u)}}}_{=\frac{1}{1-\mathbf{x}_w^{\ell(u)}\mathbf{y}_u^{\ell(w)}}}$$

(here, we have renamed the indices w and u as u and w)

$$= \prod_{w\in\mathfrak{L}} \prod_{u\in\mathfrak{L}} \frac{1}{1-\mathbf{x}_w^{\ell(u)}\mathbf{y}_u^{\ell(w)}}.$$

Combining this with (13.192.21) and (13.192.22), we obtain

$$\sum_{\lambda\in\operatorname{Par}} \mathbf{GR}_\lambda(\mathbf{x})\, p_\lambda(\mathbf{y}) = \sum_{w\in\mathfrak{A}^*} \mathbf{x}_w p_{\operatorname{CFLtype} w}(\mathbf{y}) = \prod_{w\in\mathfrak{L}} \prod_{u\in\mathfrak{L}} \frac{1}{1-\mathbf{x}_w^{\ell(u)}\mathbf{y}_u^{\ell(w)}}$$
$$= \sum_{\lambda\in\operatorname{Par}} p_\lambda(\mathbf{x})\,\mathbf{GR}_\lambda(\mathbf{y}).$$

This proves both parts (a) and (b) of Proposition 6.6.38. □

Next, let us prove Proposition 6.6.43:

Proof of Proposition 6.6.43. (a) The set N is a necklace. In other words, N is an n-necklace for some positive integer n. Consider this n.

Recall that $c\in C$ acts on $\mathfrak{A}^n$ by cyclically rotating n-tuples one step to the left (that is, it acts by the formula $c\cdot(a_1,a_2,\ldots,a_n)=(a_2,a_3,\ldots,a_n,a_1)$). Thus, the element c^n acts on $\mathfrak{A}^n$ by cyclically rotating n-tuples n steps to the left. In other words, the element c^n acts trivially on $\mathfrak{A}^n$ (since cyclically rotating an n-tuple n steps to the left does nothing). Hence, the whole subgroup $\langle c^n\rangle$ of C acts trivially on $\mathfrak{A}^n$.

The words w and w' belong to the same n-necklace (namely, to N). In other words, the words w and w' belong to the same orbit of the C-action on $\mathfrak{A}^n$ (since an n-necklace was defined to be an orbit of the

C-action on $\mathfrak{A}^n$). In other words, $C \cdot w = C \cdot w'$. Hence, $w' \in C \cdot w' = C \cdot w = \{c^p \cdot w \mid p \in \mathbb{Z}\}$ (since $C = \{c^p \mid p \in \mathbb{Z}\}$). In other words, there exists some $p \in \mathbb{Z}$ such that $w' = c^p \cdot w$. Consider this p.

Recall that n is a positive integer. Hence, we can divide p by n with remainder. Let q and r be the quotient and the remainder obtained when we divide p by n. Thus, $q \in \mathbb{Z}$ and $r \in \{0, 1, \ldots, n-1\}$ and $p = qn + r$. We have $c^{qn} = (c^n)^q \in \langle c^n \rangle$. Thus, c^{qn} acts trivially on $\mathfrak{A}^n$ (since the whole subgroup $\langle c^n \rangle$ of C acts trivially on $\mathfrak{A}^n$). Therefore, $c^{qn} \cdot w = w$.

But $p = qn + r = r + qn$, so that $c^p = c^{r+qn} = c^r c^{qn}$. Now,

$$w' = \underbrace{c^p}_{=c^r c^{qn}} \cdot w = (c^r c^{qn}) \cdot w = c^r \cdot \underbrace{(c^{qn} \cdot w)}_{=w} = c^r \cdot w.$$

Let us write the word w in the form $w = (w_1, w_2, \ldots, w_n)$. Recall that $c \in C$ acts on $\mathfrak{A}^n$ by cyclically rotating n-tuples one step to the left. Hence, c^r acts on $\mathfrak{A}^n$ by rotating n-tuples r steps to the left (since $r \in \{0, 1, \ldots, n-1\} \subset \mathbb{N}$). In other words,

$$c^r \cdot (a_1, a_2, \ldots, a_n) = (a_{r+1}, a_{r+2}, \ldots, a_n, a_1, a_2, \ldots, a_r) \qquad (13.192.23)$$

for each $(a_1, a_2, \ldots, a_n) \in \mathfrak{A}^n$ (since $r \in \{0, 1, \ldots, n-1\}$). Now,

$$\begin{aligned} w' &= c^r \cdot \underbrace{w}_{=(w_1, w_2, \ldots, w_n)} = c^r \cdot (w_1, w_2, \ldots, w_n) \\ &= (w_{r+1}, w_{r+2}, \ldots, w_n, w_1, w_2, \ldots, w_r) \qquad \text{(by (13.192.23), applied to } a_i = w_i\text{)}. \end{aligned}$$

Now, the two words $(w_1, w_2, \ldots, w_r)$ and $(w_{r+1}, w_{r+2}, \ldots, w_n)$ satisfy

$$w = (w_1, w_2, \ldots, w_n) = (w_1, w_2, \ldots, w_r)(w_{r+1}, w_{r+2}, \ldots, w_n)$$

and

$$w' = (w_{r+1}, w_{r+2}, \ldots, w_n, w_1, w_2, \ldots, w_r) = (w_{r+1}, w_{r+2}, \ldots, w_n)(w_1, w_2, \ldots, w_r).$$

Hence, there exist words u and v such that $w = uv$ and $w' = vu$ (namely, $u = (w_1, w_2, \ldots, w_r)$ and $v = (w_{r+1}, w_{r+2}, \ldots, w_n)$). This proves Proposition 6.6.43(a).

(b) Proposition 6.6.43(a) shows that there exist words u and v such that $w = uv$ and $w' = vu$. Consider these u and v. From $w = uv$, we obtain $\mathbf{x}_w = \mathbf{x}_{uv} = \mathbf{x}_u \mathbf{x}_v$ (by Lemma 13.192.1). From $w' = vu$, we obtain $\mathbf{x}_{w'} = \mathbf{x}_{vu} = \mathbf{x}_v \mathbf{x}_u$ (by Lemma 13.192.1, applied to v and u instead of u and v). Comparing this with $\mathbf{x}_w = \mathbf{x}_u \mathbf{x}_v = \mathbf{x}_v \mathbf{x}_u$, we obtain $\mathbf{x}_w = \mathbf{x}_{w'}$. Thus, Proposition 6.6.43(b) is proved. □

Next, we shall prove Proposition 6.6.48 using the following two almost trivial lemmas:

Lemma 13.192.8. *Let $a \in \mathfrak{A}^*$ be a nonempty word. Then, $\mathbf{x}_{[a]} = \mathbf{x}_a$.*

Proof of Lemma 13.192.8. Lemma 13.190.1 (applied to $u = a$) yields $a \in [a]$. In other words, a is an element of $[a]$.

Now, recall how the monomial $\mathbf{x}_N$ was defined for a necklace N: It was defined by setting $\mathbf{x}_N = \mathbf{x}_w$, where w is any element of N. Thus, if N is a necklace, then $\mathbf{x}_N = \mathbf{x}_w$ for any element w of N. Applying this to $N = [a]$ and $w = a$, we conclude that $\mathbf{x}_{[a]} = \mathbf{x}_a$ (since a is an element of $[a]$). This proves Lemma 13.192.8. □

Lemma 13.192.9. *Let λ be a partition. Let $w \in \mathfrak{A}^*$ be such that* $\operatorname{CFLtype} w = \lambda$. *Then:*

(a) *We have $\ell(w) = |\lambda|$.*

(b) *Let $(a_1, a_2, \ldots, a_k)$ be the CFL factorization of w. Then, $k = \ell(\lambda)$.*

Proof of Lemma 13.192.9. Let $(a_1, a_2, \ldots, a_k)$ be the CFL factorization of w. In other words, $(a_1, a_2, \ldots, a_k)$ is a tuple of Lyndon words satisfying $w = a_1 a_2 \cdots a_k$ and $a_1 \geq a_2 \geq \cdots \geq a_k$ (because this is how a "CFL factorization of w" is defined). From $\operatorname{CFLtype} w = \lambda$, we obtain

$$\begin{aligned} \lambda &= \operatorname{CFLtype} w \\ &= (\text{the partition obtained by listing the numbers } \ell(a_1), \ell(a_2), \ldots, \ell(a_k) \text{ in decreasing order}) \end{aligned}$$

(by the definition of $\operatorname{CFLtype} w$, since $(a_1, a_2, \ldots, a_k)$ is the CFL factorization of w). Hence, the partition λ is a rearrangement of the k-tuple $(\ell(a_1), \ell(a_2), \ldots, \ell(a_k))$ (of course, with trailing zeroes appended to it to form an infinite sequence). Thus,

$$|\lambda| = \ell(a_1) + \ell(a_2) + \cdots + \ell(a_k).$$

Comparing this with

$$\ell\left(a_1 a_2 \cdots a_k\right) = \ell\left(a_1\right) + \ell\left(a_2\right) + \cdots + \ell\left(a_k\right),$$

we obtain $\ell\left(a_1 a_2 \cdots a_k\right) = |\lambda|$. This rewrites as $\ell\left(w\right) = |\lambda|$ (since $w = a_1 a_2 \cdots a_k$). Lemma 13.192.9(a) is now proved.

(b) The words $a_1, a_2, \ldots, a_k$ are Lyndon words (since $\left(a_1, a_2, \ldots, a_k\right)$ is a tuple of Lyndon words) and thus are nonempty. Hence, their lengths $\ell\left(a_1\right), \ell\left(a_2\right), \ldots, \ell\left(a_k\right)$ are positive integers.

But recall that the partition λ is a rearrangement of the k-tuple $\left(\ell\left(a_1\right), \ell\left(a_2\right), \ldots, \ell\left(a_k\right)\right)$. Since the numbers $\ell\left(a_1\right), \ell\left(a_2\right), \ldots, \ell\left(a_k\right)$ are positive integers, we thus conclude that the partition λ has exactly k parts (i.e., exactly k nonzero entries). In other words, $\ell\left(\lambda\right) = k$. This proves Lemma 13.192.9(b). □

Proof of Proposition 6.6.48. Let us recall Definition 13.191.3 (in which we defined a nonnegative integer $\operatorname{sum} M \in \mathbb{N}$ for each finite multiset M of finite sets). Let $\mathfrak{B} = \mathfrak{A}$. Then, $\mathfrak{B}$ is a subset of $\mathfrak{A}$. Hence, Definition 13.191.5 applies.[1209] Note that $\mathfrak{B}^* = \mathfrak{A}^*$ (since $\mathfrak{B} = \mathfrak{A}$).

Let $n = |\lambda|$. Then, $n \in \mathbb{N}$. Hence, Proposition 13.191.23 yields that the maps $\operatorname{CFL} : \mathfrak{B}^n \to \mathfrak{M}\mathfrak{N}^{\mathfrak{a}}_{\mathfrak{B},n}$ and $\operatorname{LFC} : \mathfrak{M}\mathfrak{N}^{\mathfrak{a}}_{\mathfrak{B},n} \to \mathfrak{B}^n$ (introduced in Definition 13.191.10 and in Definition 13.191.21) are mutually inverse. Thus, these two maps CFL and LFC are invertible, i.e., they are bijections.

We shall now prove a sequence of simple claims:

Claim 1: Let $w \in \mathfrak{B}^n$. Then, $\operatorname{CFLtype} w = \operatorname{type}\left(\operatorname{CFL} w\right)$.

[*Proof of Claim 1:* We have $w \in \mathfrak{B}^n \subset \mathfrak{B}^* = \mathfrak{A}^*$.

Let $\left(a_1, a_2, \ldots, a_k\right)$ be the CFL factorization of w. Then, the definition of CFL yields

$$\operatorname{CFL} w = \left\{\left[a_1\right], \left[a_2\right], \ldots, \left[a_k\right]\right\}_{\text{multiset}}.$$

Hence, the sizes of the necklaces in $\operatorname{CFL} w$ are the numbers $\left|\left[a_1\right]\right|, \left|\left[a_2\right]\right|, \ldots, \left|\left[a_k\right]\right|$.

We have $\left|\left[a_i\right]\right| = \ell\left(a_i\right)$ for each $i \in \{1, 2, \ldots, k\}$. [1210]

Recall that $\left(a_1, a_2, \ldots, a_k\right)$ is the CFL factorization of w. Hence, the definition of $\operatorname{CFLtype} w$ shows that

$$\begin{aligned}&\operatorname{CFLtype} w\\&= \left(\text{the partition obtained by listing the numbers } \ell\left(a_1\right), \ell\left(a_2\right), \ldots, \ell\left(a_k\right) \text{ in decreasing order}\right).\end{aligned}$$

Comparing this with

$$\begin{aligned}&\operatorname{type}\left(\operatorname{CFL} w\right)\\&= \left(\text{the partition obtained by listing the sizes of the necklaces in } \operatorname{CFL} w \text{ in decreasing order}\right)\\&\qquad \left(\text{by the definition of } \operatorname{type}\left(\operatorname{CFL} w\right)\right)\\&= \left(\text{the partition obtained by listing the numbers } \left|\left[a_1\right]\right|, \left|\left[a_2\right]\right|, \ldots, \left|\left[a_k\right]\right| \text{ in decreasing order}\right)\\&\qquad \left(\text{since the sizes of the necklaces in } \operatorname{CFL} w \text{ are the numbers } \left|\left[a_1\right]\right|, \left|\left[a_2\right]\right|, \ldots, \left|\left[a_k\right]\right|\right)\\&= \left(\text{the partition obtained by listing the numbers } \ell\left(a_1\right), \ell\left(a_2\right), \ldots, \ell\left(a_k\right) \text{ in decreasing order}\right)\\&\qquad \left(\text{because } \left|\left[a_i\right]\right| = \ell\left(a_i\right) \text{ for each } i \in \{1, 2, \ldots, k\}\right),\end{aligned}$$

we obtain $\operatorname{CFLtype} w = \operatorname{type}\left(\operatorname{CFL} w\right)$. This proves Claim 1.]

Claim 2: We have $\{w \in \mathfrak{A}^* \mid \operatorname{CFLtype} w = \lambda\} = \{w \in \mathfrak{B}^n \mid \operatorname{CFLtype} w = \lambda\}$.

[*Proof of Claim 2:* Each $w \in \mathfrak{A}^*$ satisfying $\operatorname{CFLtype} w = \lambda$ must also satisfy $w \in \mathfrak{A}^n$ (since Lemma 13.192.9(a) yields $\ell\left(w\right) = |\lambda| = n$). Hence,

$$\{w \in \mathfrak{A}^* \mid \operatorname{CFLtype} w = \lambda\} \subset \{w \in \mathfrak{A}^n \mid \operatorname{CFLtype} w = \lambda\}.$$

On the other hand,

$$\{w \in \mathfrak{A}^n \mid \operatorname{CFLtype} w = \lambda\} \subset \{w \in \mathfrak{A}^* \mid \operatorname{CFLtype} w = \lambda\}$$

(since $\mathfrak{A}^n \subset \mathfrak{A}^*$). Combining these two inclusions, we obtain

$$\{w \in \mathfrak{A}^* \mid \operatorname{CFLtype} w = \lambda\} = \{w \in \mathfrak{A}^n \mid \operatorname{CFLtype} w = \lambda\}.$$

[1209] This is the reason why we introduced $\mathfrak{B}$ to begin with – we wanted to apply Definition 13.191.5 (and, later, Proposition 13.191.23).

[1210] Indeed, this is precisely the statement of Claim 1 **(b)** in the proof of Proposition 13.191.9. We refer to the latter proof for a proof of this statement.

Since $\mathfrak{B} = \mathfrak{A}$, this rewrites as $\{w \in \mathfrak{A}^* \mid \operatorname{CFLtype} w = \lambda\} = \{w \in \mathfrak{B}^n \mid \operatorname{CFLtype} w = \lambda\}$. This proves Claim 2.]

Claim 3: Let $w \in \mathfrak{B}^n$. Then, $\mathbf{x}_w = \mathbf{x}_{\operatorname{CFL} w}$.

[*Proof of Claim 3:* Set $M = \operatorname{CFL} w$. The definition of $\mathbf{x}_M$ yields

$$\mathbf{x}_M = \mathbf{x}_{N_1}\mathbf{x}_{N_2}\cdots\mathbf{x}_{N_k}, \tag{13.192.24}$$

where M is written in the form $M = \{N_1, N_2, \ldots, N_k\}_{\text{multiset}}$.

Let $(a_1, a_2, \ldots, a_k)$ be the CFL factorization of w. Then, the definition of CFL yields $\operatorname{CFL} w = \{[a_1], [a_2], \ldots, [a_k]\}_{\text{multiset}}$. Thus, $M = \operatorname{CFL} w = \{[a_1], [a_2], \ldots, [a_k]\}_{\text{multiset}}$. Hence, (13.192.24) (applied to $N_i = [a_i]$) yields

$$\mathbf{x}_M = \mathbf{x}_{[a_1]}\mathbf{x}_{[a_2]}\cdots\mathbf{x}_{[a_k]}. \tag{13.192.25}$$

But we know that $(a_1, a_2, \ldots, a_k)$ is a CFL factorization of w. In other words, $(a_1, a_2, \ldots, a_k)$ is a tuple of Lyndon words satisfying $w = a_1a_2\cdots a_k$ and $a_1 \geq a_2 \geq \cdots \geq a_k$ (because this is how a "CFL factorization of w" is defined). From $w = a_1a_2\cdots a_k$, we obtain

$$\mathbf{x}_w = \mathbf{x}_{a_1a_2\cdots a_k} = \mathbf{x}_{a_1}\mathbf{x}_{a_2}\cdots\mathbf{x}_{a_k} \qquad \text{(by Lemma 13.192.2)}. \tag{13.192.26}$$

On the other hand, each $i \in \{1, 2, \ldots, k\}$ satisfies $\mathbf{x}_{[a_i]} = \mathbf{x}_{a_i}$ [1211]. Hence, $\underbrace{\mathbf{x}_{[a_1]}}_{=\mathbf{x}_{a_1}}\underbrace{\mathbf{x}_{[a_2]}}_{=\mathbf{x}_{a_2}}\cdots\underbrace{\mathbf{x}_{[a_k]}}_{=\mathbf{x}_{a_k}} = \mathbf{x}_{a_1}\mathbf{x}_{a_2}\cdots\mathbf{x}_{a_k}$. This shows that the right hand sides of the equalities (13.192.25) and (13.192.26) are equal. Hence, their left hand sides are equal as well. In other words, $\mathbf{x}_M = \mathbf{x}_w$. Hence, $\mathbf{x}_w = \mathbf{x}_M = \mathbf{x}_{\operatorname{CFL} w}$ (since $M = \operatorname{CFL} w$). This proves Claim 3.]

Claim 4: Let $M \in \mathfrak{MN}^{\mathfrak{a}}$ be such that $\operatorname{type} M = \lambda$. Then, $\operatorname{sum} M = n$.

[*Proof of Claim 4:* We have $M \in \mathfrak{MN}^{\mathfrak{a}}$. In other words, M is a finite multiset of aperiodic necklaces. Let us thus write the multiset M in the form $M = \{N_1, N_2, \ldots, N_k\}_{\text{multiset}}$ for some aperiodic necklaces $N_1, N_2, \ldots, N_k$. Hence, the sizes of the necklaces are in M are the numbers $|N_1|, |N_2|, \ldots, |N_k|$.

But $\operatorname{type} M = \lambda$, so that

$$\begin{aligned}
\lambda &= \operatorname{type} M \\
&= (\text{the partition obtained by listing the sizes of the necklaces in } M \text{ in decreasing order}) \\
&\qquad (\text{by the definition of } \operatorname{type} M) \\
&= (\text{the partition obtained by listing the numbers } |N_1|, |N_2|, \ldots, |N_k| \text{ in decreasing order}) \\
&\qquad (\text{since the sizes of the necklaces in } M \text{ are the numbers } |N_1|, |N_2|, \ldots, |N_k|).
\end{aligned}$$

Hence,

$$|\lambda| = |N_1| + |N_2| + \cdots + |N_k| = \operatorname{sum} M \qquad (\text{by } (13.191.5)).$$

Hence, $n = |\lambda| = \operatorname{sum} M$. This proves Claim 4.]

Claim 5: We have

$$\left\{M \in \mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n} \mid \operatorname{type} M = \lambda\right\} = \left\{M \in \mathfrak{MN}^{\mathfrak{a}} \mid \operatorname{type} M = \lambda\right\}.$$

[*Proof of Claim 5:* First, we observe that $\mathfrak{B}$-necklaces and necklaces are the same thing[1212]. Moreover, $\mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n} \subset \mathfrak{MN}^{\mathfrak{a}}$ (by the definitions of $\mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}$ and $\mathfrak{MN}^{\mathfrak{a}}$, since each $\mathfrak{B}$-necklace is a necklace).

Now, if $M \in \mathfrak{MN}^{\mathfrak{a}}$ satisfies $\operatorname{type} M = \lambda$, then $M \in \mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}$ [1213]. Hence,

$$\left\{M \in \mathfrak{MN}^{\mathfrak{a}} \mid \operatorname{type} M = \lambda\right\} \subset \left\{M \in \mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n} \mid \operatorname{type} M = \lambda\right\}.$$

[1211] *Proof.* Let $i \in \{1, 2, \ldots, k\}$. Then, a_i is a Lyndon word (since $(a_1, a_2, \ldots, a_k)$ is a tuple of Lyndon words), and thus is nonempty (since any Lyndon word is nonempty). Hence, Lemma 13.192.8 (applied to $a = a_i$) yields $\mathbf{x}_{[a_i]} = \mathbf{x}_{a_i}$. Qed.

[1212] *Proof.* Every necklace is a subset of $\mathfrak{A}^*$. In other words, every necklace is a subset of $\mathfrak{B}^*$ (since $\mathfrak{A} = \mathfrak{B}$). Hence, every necklace is a $\mathfrak{B}$-necklace. Conversely, every $\mathfrak{B}$-necklace is a necklace. Combining the previous two sentences, we conclude that $\mathfrak{B}$-necklaces and necklaces are the same thing.

[1213] *Proof.* Let $M \in \mathfrak{MN}^{\mathfrak{a}}$ satisfy $\operatorname{type} M = \lambda$. Then, Claim 4 yields $\operatorname{sum} M = n$. Moreover, $M \in \mathfrak{MN}^{\mathfrak{a}}$ shows that M is a finite multiset of aperiodic necklaces (by the definition of $\mathfrak{MN}^{\mathfrak{a}}$). In other words, M is a finite multiset of aperiodic $\mathfrak{B}$-necklaces (since $\mathfrak{B}$-necklaces and necklaces are the same thing). Since M furthermore satisfies $\operatorname{sum} M = n$, we thus conclude that $M \in \mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}$ (by the definition of $\mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}$). Qed.

Combining this with

$$\left\{ M \in \underbrace{\mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}}_{\subset \mathfrak{MN}^{a}} \mid \operatorname{type} M = \lambda \right\} \subset \left\{ M \in \mathfrak{MN}^{\mathfrak{a}} \mid \operatorname{type} M = \lambda \right\},$$

we obtain $\left\{ M \in \mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n} \mid \operatorname{type} M = \lambda \right\} = \left\{ M \in \mathfrak{MN}^{\mathfrak{a}} \mid \operatorname{type} M = \lambda \right\}$. This proves Claim 5.]

Now, Claim 2 shows that we have the following equality between summation signs:

$$\sum_{\substack{w \in \mathfrak{A}^*; \\ \operatorname{CFLtype} w = \lambda}} = \sum_{\substack{w \in \mathfrak{B}^n; \\ \operatorname{CFLtype} w = \lambda}} = \sum_{\substack{w \in \mathfrak{B}^n; \\ \operatorname{type}(\operatorname{CFL} w) = \lambda}}$$

(since Claim 1 shows that $\operatorname{CFLtype} w = \operatorname{type}(\operatorname{CFL} w)$ for each $w \in \mathfrak{B}^n$). But the definition of $\mathbf{GR}_\lambda$ yields

$$\mathbf{GR}_\lambda = \underbrace{\sum_{\substack{w \in \mathfrak{A}^*; \\ \operatorname{CFLtype} w = \lambda}}}_{= \sum_{\substack{w \in \mathfrak{B}^n; \\ \operatorname{type}(\operatorname{CFL} w) = \lambda}}} \mathbf{x}_w = \sum_{\substack{w \in \mathfrak{B}^n; \\ \operatorname{type}(\operatorname{CFL} w) = \lambda}} \underbrace{\mathbf{x}_w}_{\substack{= \mathbf{x}_{\operatorname{CFL} w} \\ \text{(by Claim 3)}}} = \sum_{\substack{w \in \mathfrak{B}^n; \\ \operatorname{type}(\operatorname{CFL} w) = \lambda}} \mathbf{x}_{\operatorname{CFL} w}$$

$$= \sum_{\substack{M \in \mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}; \\ \operatorname{type} M = \lambda}} \mathbf{x}_M \qquad (13.192.27)$$

(here, we have substituted M for $\operatorname{CFL} w$ in the sum, since the map $\operatorname{CFL} : \mathfrak{B}^n \to \mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}$ is a bijection). On the other hand, Claim 5 leads to the following equality between summation signs:

$$\sum_{\substack{M \in \mathfrak{MN}^{\mathfrak{a}}_{\mathfrak{B},n}; \\ \operatorname{type} M = \lambda}} = \sum_{\substack{M \in \mathfrak{MN}^{a}; \\ \operatorname{type} M = \lambda}}.$$

Using this equality, we can rewrite (13.192.27) as

$$\mathbf{GR}_\lambda = \sum_{\substack{M \in \mathfrak{MN}^{a}; \\ \operatorname{type} M = \lambda}} \mathbf{x}_M.$$

This proves Proposition 6.6.48. □

Next, we shall prove Proposition 6.6.49 using the following lemma:

Lemma 13.192.10. *Let $w \in \mathfrak{A}^*$. Then, $\mathbf{x}_{\operatorname{GR} w} = \mathbf{x}_w$.*

Proof of Lemma 13.192.10. Let $n = \ell(w)$. Thus, $w \in \mathfrak{A}^n$, so that $w = (w_1, w_2, \ldots, w_n)$. In particular, the n letters $w_1, w_2, \ldots, w_n$ are well-defined. For each $i \in \{1, 2, \ldots, n\}$, we set

$$q_i := x_{w_i}. \qquad (13.192.28)$$

(This notation will help us avoid towers of subscripts. For example, we shall soon work with expressions like q_{h_j}; without this notation, we would have to write $x_{w_{h_j}}$ for them.)

We have $w = (w_1, w_2, \ldots, w_n)$. Thus, the definition of $\mathbf{x}_w$ yields

$$\mathbf{x}_w = x_{w_1} x_{w_2} \cdots x_{w_n} = \prod_{i \in \{1,2,\ldots,n\}} \underbrace{x_{w_i}}_{\substack{= q_i \\ \text{(by (13.192.28))}}}$$

$$= \prod_{i \in \{1,2,\ldots,n\}} q_i. \qquad (13.192.29)$$

Recall that $w \in \mathfrak{A}^n$. Let τ be the permutation $(\operatorname{std} w)^{-1} \in \mathfrak{S}_n$. Then, the definition of the multiset $\operatorname{GR} w \in \mathfrak{MN}^{a}$ shows that

$$\operatorname{GR} w = \left\{ [w]_z \mid z \text{ is a cycle of } \tau \right\}_{\text{multiset}}. \qquad (13.192.30)$$

Let us now show the following two claims:

Claim 1: Let $u \in \mathfrak{A}^*$ be a word. Let $h_1, h_2, \ldots, h_k$ be some elements of $\{1, 2, \ldots, n\}$ such that $u = (w_{h_1}, w_{h_2}, \ldots, w_{h_k})$. Then,

$$\mathbf{x}_u = q_{h_1} q_{h_2} \cdots q_{h_k}.$$

[*Proof of Claim 1:* We have $u = (w_{h_1}, w_{h_2}, \ldots, w_{h_k})$. Thus, the definition of $\mathbf{x}_u$ yields

$$\mathbf{x}_u = x_{w_{h_1}} x_{w_{h_2}} \cdots x_{w_{h_k}} = \prod_{j \in \{1,2,\ldots,k\}} x_{w_{h_j}}.$$

Comparing this with

$$q_{h_1} q_{h_2} \cdots q_{h_k} = \prod_{j \in \{1,2,\ldots,k\}} \underbrace{q_{h_j}}_{\substack{= x_{w_{h_j}} \\ \text{(by (13.192.28), applied to } i = h_j)}} = \prod_{j \in \{1,2,\ldots,k\}} x_{w_{h_j}},$$

we obtain $\mathbf{x}_u = q_{h_1} q_{h_2} \cdots q_{h_k}$. This proves Claim 1.]

Claim 2: Let z be a cycle of τ. Then,

$$\mathbf{x}_{[w]_z} = \prod_{i \in z} q_i.$$

[*Proof of Claim 2:* The definition of $[w]_z$ yields $[w]_z = \{w_{\tau,i} \mid i \in z\}$. The set z is a cycle of τ, and thus is nonempty (since any cycle of τ is nonempty). Hence, there exists some $h \in z$. Consider this h. Proposition 6.6.7(a) yields $[w_{\tau,h}] = \{w_{\tau,i} \mid i \in z\}$. Comparing this with $[w]_z = \{w_{\tau,i} \mid i \in z\}$, we obtain $[w]_z = [w_{\tau,h}]$.

The definition of $w_{\tau,h}$ (given in Definition 6.6.3(b)) yields

$$w_{\tau,h} = w_{\tau^1(h)} w_{\tau^2(h)} \cdots w_{\tau^k(h)}, \qquad \text{where } k = \operatorname{ord}_\tau(h). \tag{13.192.31}$$

Let k be the size of z. Thus, $k = |z| \geq 1$ (since z is nonempty).

For each $u \in \mathbb{N}$, we set $h_u := \tau^u(h)$. Then, Lemma 13.189.1(e) (applied to $p = h$ and $p_i = h_i$ and $u = 0$) yields $h_{0+k} = h_0$. In other words, $h_k = h_0$ (since $0 + k = k$). Furthermore, Lemma 13.189.1(c) (applied to $p = h$ and $p_i = h_i$) yields $z = \{h_0, h_1, \ldots, h_{k-1}\}$. Also, Lemma 13.189.1(g) (applied to $p = h$ and $p_i = h_i$) yields that the k elements $h_0, h_1, \ldots, h_{k-1}$ are distinct. Finally, Lemma 13.189.1(i) (applied to $p = h$ and $p_i = h_i$) yields $\operatorname{ord}_\tau(h) = k$. Thus, $k = \operatorname{ord}_\tau(h)$; hence, from (13.192.31), we obtain

$$w_{\tau,h} = w_{\tau^1(h)} w_{\tau^2(h)} \cdots w_{\tau^k(h)} = \left(w_{\tau^1(h)}, w_{\tau^2(h)}, \ldots, w_{\tau^k(h)}\right) \tag{13.192.32}$$

(since $w_{\tau^1(h)}, w_{\tau^2(h)}, \ldots, w_{\tau^k(h)}$ are single letters). On the other hand, each $u \in \{1, 2, \ldots, k\}$ satisfies $w_{h_u} = w_{\tau^u(h)}$ (since $h_u = \tau^u(h)$ (by the definition of h_u)). In other words, we have

$$(w_{h_1}, w_{h_2}, \ldots, w_{h_k}) = \left(w_{\tau^1(h)}, w_{\tau^2(h)}, \ldots, w_{\tau^k(h)}\right).$$

Comparing this with (13.192.32), we obtain

$$w_{\tau,h} = (w_{h_1}, w_{h_2}, \ldots, w_{h_k}).$$

Hence, Claim 1 (applied to $u = w_{\tau,h}$) yields

$$\begin{aligned}
\mathbf{x}_{w_{\tau,h}} &= q_{h_1} q_{h_2} \cdots q_{h_k} = \left(q_{h_1} q_{h_2} \cdots q_{h_{k-1}}\right) \underbrace{q_{h_k}}_{\substack{= q_{h_0} \\ \text{(since } h_k = h_0)}} \qquad \text{(since } k \geq 1) \\
&= \left(q_{h_1} q_{h_2} \cdots q_{h_{k-1}}\right) q_{h_0} = q_{h_0} \left(q_{h_1} q_{h_2} \cdots q_{h_{k-1}}\right) \\
&= q_{h_0} q_{h_1} \cdots q_{h_{k-1}}.
\end{aligned} \tag{13.192.33}$$

But the list $(h_0, h_1, \ldots, h_{k-1})$ is a list of all elements of z without repetitions (since $z = \{h_0, h_1, \ldots, h_{k-1}\}$ and because the k elements $h_0, h_1, \ldots, h_{k-1}$ are distinct). Thus,

$$\prod_{i \in z} q_i = q_{h_0} q_{h_1} \cdots q_{h_{k-1}}.$$

Comparing this with (13.192.33), we obtain

$$\prod_{i \in z} q_i = \mathbf{x}_{w_{\tau,h}}. \tag{13.192.34}$$

The word $w_{\tau,h}$ has length k (since $w_{\tau,h} = (w_{h_1}, w_{h_2}, \ldots, w_{h_k})$), and thus is nonempty (since $k \geq 1 > 0$). Hence, Lemma 13.192.8 (applied to $a = w_{\tau,h}$) yields $\mathbf{x}_{[w_{\tau,h}]} = \mathbf{x}_{w_{\tau,h}}$. In view of $[w]_z = [w_{\tau,h}]$, this rewrites as $\mathbf{x}_{[w]_z} = \mathbf{x}_{w_{\tau,h}}$. Comparing this with (13.192.34), we obtain $\mathbf{x}_{[w]_z} = \prod_{i \in z} q_i$. This proves Claim 2.]

We know that $\operatorname{GR} w$ is a finite multiset of necklaces. Thus, the definition of the monomial $\mathbf{x}_{\operatorname{GR} w}$ shows that $\mathbf{x}_{\operatorname{GR} w} = \mathbf{x}_{N_1} \mathbf{x}_{N_2} \cdots \mathbf{x}_{N_k}$, where $\operatorname{GR} w$ is written in the form $\operatorname{GR} w = \{N_1, N_2, \ldots, N_k\}_{\text{multiset}}$. In other words, if $N_1, N_2, \ldots, N_k$ are necklaces such that $\operatorname{GR} w = \{N_1, N_2, \ldots, N_k\}_{\text{multiset}}$, then

$$\mathbf{x}_{\operatorname{GR} w} = \mathbf{x}_{N_1} \mathbf{x}_{N_2} \cdots \mathbf{x}_{N_k}. \tag{13.192.35}$$

Recall that $\tau \in \mathfrak{S}_n$. Hence, the cycles of τ are disjoint subsets of $\{1, 2, \ldots, n\}$, and each element of $\{1, 2, \ldots, n\}$ lies in exactly one of these cycles.

Let $z_1, z_2, \ldots, z_k$ be all the cycles of τ (listed without repetitions). The equality (13.192.30) becomes

$$\operatorname{GR} w = \left\{ [w]_z \ \mid \ z \text{ is a cycle of } \tau \right\}_{\text{multiset}} = \left\{ [w]_{z_1}, [w]_{z_2}, \ldots, [w]_{z_k} \right\}_{\text{multiset}}$$

(since $z_1, z_2, \ldots, z_k$ are all the cycles of τ, listed without repetitions).
Hence, (13.192.35) (applied to $N_i = [w]_{z_i}$) yields

$$\begin{aligned}
\mathbf{x}_{\operatorname{GR} w} = \mathbf{x}_{[w]_{z_1}} \mathbf{x}_{[w]_{z_2}} \cdots \mathbf{x}_{[w]_{z_k}} &= \prod_{z \text{ is a cycle of } \tau} \underbrace{\mathbf{x}_{[w]_z}}_{\substack{= \prod_{i \in z} q_i \\ \text{(by Claim 2)}}} \\
&\qquad \left(\begin{array}{c} \text{since } z_1, z_2, \ldots, z_k \text{ are all the cycles of } \tau \\ \text{(listed without repetitions)} \end{array} \right) \\
&= \underbrace{\prod_{z \text{ is a cycle of } \tau} \prod_{i \in z}}_{\substack{= \prod_{i \in \{1,2,\ldots,n\}} \\ \text{(since the cycles of } \tau \text{ are subsets of } \{1,2,\ldots,n\}, \\ \text{and since each element of } \{1,2,\ldots,n\} \text{ lies in} \\ \text{exactly one of these cycles)}}} q_i = \prod_{i \in \{1,2,\ldots,n\}} q_i = \mathbf{x}_w \qquad \text{(by (13.192.29))}.
\end{aligned}$$

This proves Lemma 13.192.10. □

Proof of Proposition 6.6.49. Theorem 6.6.29 says that the maps $\operatorname{GR} : \mathfrak{A}^* \to \mathfrak{MN}^{\mathfrak{a}}$ and $\operatorname{RG} : \mathfrak{MN}^{\mathfrak{a}} \to \mathfrak{A}^*$ are mutually inverse bijections. But Proposition 6.6.48 yields

$$\begin{aligned}
\mathbf{GR}_\lambda = \sum_{\substack{M \in \mathfrak{MN}^{\mathfrak{a}}; \\ \operatorname{type} M = \lambda}} \mathbf{x}_M &= \sum_{\substack{w \in \mathfrak{A}^*; \\ \operatorname{type}(\operatorname{GR} w) = \lambda}} \underbrace{\mathbf{x}_{\operatorname{GR} w}}_{\substack{= \mathbf{x}_w \\ \text{(by Lemma 13.192.10)}}} \\
&\qquad \left(\begin{array}{c} \text{here, we have substituted } \operatorname{GR} w \text{ for } M \text{ in the sum,} \\ \text{since the map } \operatorname{GR} : \mathfrak{A}^* \to \mathfrak{MN}^{\mathfrak{a}} \text{ is a bijection} \end{array} \right) \\
&= \sum_{\substack{w \in \mathfrak{A}^*; \\ \operatorname{type}(\operatorname{GR} w) = \lambda}} \mathbf{x}_w .
\end{aligned}$$

This proves Proposition 6.6.49. □

In order to prove Proposition 6.6.50, we will need the following two facts:

Proposition 13.192.11. *Let $n \in \mathbb{N}$. Let $\tau \in \mathfrak{S}_n$. Then,* $\operatorname{type}\left(\tau^{-1}\right) = \operatorname{type} \tau$.

Proof of Proposition 13.192.11. It is well-known that the permutations τ and τ^{-1} have the same cycle type[1214]. In other words, $\operatorname{type}\left(\tau^{-1}\right) = \operatorname{type} \tau$ (because $\operatorname{type} \sigma$ denotes the cycle type of a permutation σ). This proves Proposition 13.192.11. □

Proposition 13.192.12. *Let $w \in \mathfrak{A}^*$. Then,* $\operatorname{type}(\operatorname{GR} w) = \operatorname{type}(\operatorname{std} w)$.

[1214] In fact, they have the same cycles, if we regard the cycles of a permutation as sets.

Proof of Proposition 13.192.12. Let $n = \ell(w)$. Then, $w \in \mathfrak{A}^n$. Let τ be the permutation $(\operatorname{std} w)^{-1} \in \mathfrak{S}_n$. Then, the definition of the multiset $\operatorname{GR} w \in \mathfrak{MN}^{\mathfrak{a}}$ shows that

$$\operatorname{GR} w = \{[w]_z \mid z \text{ is a cycle of } \tau\}_{\text{multiset}} . \tag{13.192.36}$$

Let $z_1, z_2, \ldots, z_k$ be the cycles of τ, listed in some order (with no repetitions). Thus, (13.192.36) becomes

$$\begin{aligned}\operatorname{GR} w &= \{[w]_z \mid z \text{ is a cycle of } \tau\}_{\text{multiset}} \\ &= \left\{[w]_{z_1}, [w]_{z_2}, \ldots, [w]_{z_k}\right\}_{\text{multiset}} \qquad (13.192.37)\end{aligned}$$

(since $z_1, z_2, \ldots, z_k$ are the cycles of τ, listed with no repetitions).

Hence, the necklaces in $\operatorname{GR} w$ are $[w]_{z_1}, [w]_{z_2}, \ldots, [w]_{z_k}$. Therefore, the sizes of the necklaces in $\operatorname{GR} w$ are the numbers $\left|[w]_{z_1}\right|, \left|[w]_{z_2}\right|, \ldots, \left|[w]_{z_k}\right|$.

Now, it is easy to see that

$$\left|[w]_{z_m}\right| = |z_m| \qquad \text{for each } m \in \{1, 2, \ldots, k\} . \tag{13.192.38}$$

[*Proof of (13.192.38):* Let $m \in \{1, 2, \ldots, k\}$. Then, z_m is a cycle of τ (since $z_1, z_2, \ldots, z_k$ are the cycles of τ). Thus, the definition of $[w]_{z_m}$ yields $[w]_{z_m} = \{w_{\tau,i} \mid i \in z_m\}$. But Proposition 6.6.7(c) (applied to $z = z_m$) shows that $|\{w_{\tau,i} \mid i \in z_m\}| = |z_m|$. Since $[w]_{z_m} = \{w_{\tau,i} \mid i \in z_m\}$, this rewrites as $\left|[w]_{z_m}\right| = |z_m|$. This proves (13.192.38).]

But the definition of $\operatorname{type}(\operatorname{GR} w)$ yields

$$\begin{aligned}&\operatorname{type}(\operatorname{GR} w) \\ &= (\text{the partition obtained by listing the sizes of the necklaces in } \operatorname{GR} w \text{ in decreasing order}) \\ &= \left(\text{the partition obtained by listing the numbers } \left|[w]_{z_1}\right|, \left|[w]_{z_2}\right|, \ldots, \left|[w]_{z_k}\right| \text{ in decreasing order}\right) \\ &\qquad \left(\text{since the sizes of the necklaces in } \operatorname{GR} w \text{ are the numbers } \left|[w]_{z_1}\right|, \left|[w]_{z_2}\right|, \ldots, \left|[w]_{z_k}\right|\right) \\ &= (\text{the partition obtained by listing the numbers } |z_1|, |z_2|, \ldots, |z_k| \text{ in decreasing order}) \\ &\qquad (\text{by } (13.192.38)) .\end{aligned}$$

On the other hand, $\tau = (\operatorname{std} w)^{-1}$, so that $\tau^{-1} = \operatorname{std} w$. But Proposition 13.192.11 yields $\operatorname{type}\left(\tau^{-1}\right) = \operatorname{type} \tau$, so that $\operatorname{type} \tau = \operatorname{type}\left(\tau^{-1}\right) = \operatorname{type}(\operatorname{std} w)$ (since $\tau^{-1} = \operatorname{std} w$).

But $\operatorname{type} \tau$ is the cycle type of τ. In other words, $\operatorname{type} \tau$ is the partition obtained by listing the sizes of the cycles of τ in decreasing order (by the definition of the cycle type of τ). Hence,

$$\begin{aligned}&\operatorname{type} \tau \\ &= (\text{the partition obtained by listing the sizes of the cycles of } \tau \text{ in decreasing order}) \\ &= (\text{the partition obtained by listing the sizes of } z_1, z_2, \ldots, z_k \text{ in decreasing order}) \\ &\qquad (\text{since the cycles of } \tau \text{ are } z_1, z_2, \ldots, z_k \text{ (listed with no repetitions)}) \\ &= (\text{the partition obtained by listing the numbers } |z_1|, |z_2|, \ldots, |z_k| \text{ in decreasing order}) .\end{aligned}$$

Comparing this with

$$\begin{aligned}&\operatorname{type}(\operatorname{GR} w) \\ &= (\text{the partition obtained by listing the numbers } |z_1|, |z_2|, \ldots, |z_k| \text{ in decreasing order}) ,\end{aligned}$$

we obtain $\operatorname{type}(\operatorname{GR} w) = \operatorname{type} \tau = \operatorname{type}(\operatorname{std} w)$. This proves Proposition 13.192.12. □

Proof of Proposition 6.6.50. Proposition 6.6.49 yields

$$\mathbf{GR}_\lambda = \underbrace{\sum_{\substack{w \in \mathfrak{A}^*; \\ \operatorname{type}(\operatorname{GR} w) = \lambda}}}_{\substack{= \sum_{\substack{w \in \mathfrak{A}^*; \\ \operatorname{type}(\operatorname{std} w) = \lambda}} \\ \text{(since Proposition 13.192.12} \\ \text{yields } \operatorname{type}(\operatorname{GR} w) = \operatorname{type}(\operatorname{std} w) \text{ for each } w \in \mathfrak{A}^*)}} \mathbf{x}_w = \sum_{\substack{w \in \mathfrak{A}^*; \\ \operatorname{type}(\operatorname{std} w) = \lambda}} \mathbf{x}_w .$$

This proves Proposition 6.6.50. □

Next, we can easily prove Proposition 6.6.40:

Proof of Proposition 6.6.40. We have the following:

Claim 1: Let $w \in \mathfrak{A}^*$ satisfy $\operatorname{type}(\operatorname{std} w) = \lambda$. Then, $w \in \mathfrak{A}^n$.

[*Proof of Claim 1:* Let $m = \ell(w)$. Thus, $w \in \mathfrak{A}^m$, so that $\operatorname{std} w \in \mathfrak{S}_m$. But every permutation $\tau \in \mathfrak{S}_m$ satisfies $\operatorname{type} \tau \in \operatorname{Par}_m$ (since $\operatorname{type} \tau$ denotes the cycle type of τ, which is always a partition of m). Applying this to $\tau = \operatorname{std} w$, we conclude that $\operatorname{type}(\operatorname{std} w) \in \operatorname{Par}_m$. In view of $\operatorname{type}(\operatorname{std} w) = \lambda$, this rewrites as $\lambda \in \operatorname{Par}_m$. Thus, $|\lambda| = m$, so that $n = |\lambda| = m$. Hence, $m = n$. Now, $w \in \mathfrak{A}^m = \mathfrak{A}^n$ (since $m = n$). This proves Claim 1.]

Claim 2: We have $\{w \in \mathfrak{A}^* \mid \operatorname{type}(\operatorname{std} w) = \lambda\} = \{w \in \mathfrak{A}^n \mid \operatorname{type}(\operatorname{std} w) = \lambda\}$.

[*Proof of Claim 2:* Each $w \in \mathfrak{A}^*$ that satisfies $\operatorname{type}(\operatorname{std} w) = \lambda$ must also satisfy $w \in \mathfrak{A}^n$ (by Claim 1). Hence,

$$\{w \in \mathfrak{A}^* \mid \operatorname{type}(\operatorname{std} w) = \lambda\} \subset \{w \in \mathfrak{A}^n \mid \operatorname{type}(\operatorname{std} w) = \lambda\}.$$

Combining this with

$$\left\{w \in \underbrace{\mathfrak{A}^n}_{\subset \mathfrak{A}^*} \mid \operatorname{type}(\operatorname{std} w) = \lambda\right\} \subset \{w \in \mathfrak{A}^* \mid \operatorname{type}(\operatorname{std} w) = \lambda\},$$

we obtain $\{w \in \mathfrak{A}^* \mid \operatorname{type}(\operatorname{std} w) = \lambda\} = \{w \in \mathfrak{A}^n \mid \operatorname{type}(\operatorname{std} w) = \lambda\}$. This proves Claim 2.]

Claim 2 yields the following equality between summation signs:

$$\sum_{\substack{w \in \mathfrak{A}^*;\\ \operatorname{type}(\operatorname{std} w) = \lambda}} = \sum_{\substack{w \in \mathfrak{A}^n;\\ \operatorname{type}(\operatorname{std} w) = \lambda}}.$$

But Proposition 6.6.50 yields

$$\mathbf{GR}_\lambda = \underbrace{\sum_{\substack{w \in \mathfrak{A}^*;\\ \operatorname{type}(\operatorname{std} w) = \lambda}}}_{= \sum_{\substack{w \in \mathfrak{A}^n;\\ \operatorname{type}(\operatorname{std} w) = \lambda}}} \mathbf{x}_w = \underbrace{\sum_{\substack{w \in \mathfrak{A}^n;\\ \operatorname{type}(\operatorname{std} w) = \lambda}}}_{\substack{= \sum_{\substack{\sigma \in \mathfrak{S}_n;\\ \operatorname{type} \sigma = \lambda}} \sum_{\substack{w \in \mathfrak{A}^n;\\ \operatorname{std} w = \sigma}} \\ \text{(here, we have split the sum} \\ \text{according to the value of } \operatorname{std} w, \\ \text{because } \operatorname{std} w \in \mathfrak{S}_n \text{ for each } w \in \mathfrak{A}^n)}} \mathbf{x}_w$$

$$= \sum_{\substack{\sigma \in \mathfrak{S}_n;\\ \operatorname{type} \sigma = \lambda}} \sum_{\substack{w \in \mathfrak{A}^n;\\ \operatorname{std} w = \sigma}} \mathbf{x}_w = \underbrace{\sum_{\substack{\sigma \in \mathfrak{S}_n;\\ \operatorname{type}(\sigma^{-1}) = \lambda}}}_{\substack{= \sum_{\substack{\sigma \in \mathfrak{S}_n;\\ \operatorname{type} \sigma = \lambda}} \\ \text{(since each } \sigma \in \mathfrak{S}_n \text{ satisfies } \operatorname{type}(\sigma^{-1}) = \operatorname{type} \sigma \\ \text{(by Proposition 13.192.11, applied to } \tau = \sigma))}} \sum_{\substack{w \in \mathfrak{A}^n;\\ \operatorname{std} w = \sigma^{-1}}} \mathbf{x}_w$$

$$\left(\begin{array}{c}\text{here, we have substituted } \sigma^{-1} \text{ for } \sigma \text{ in the outer sum,} \\ \text{since the map } \mathfrak{S}_n \to \mathfrak{S}_n,\ \sigma \mapsto \sigma^{-1} \text{ is a bijection}\end{array}\right)$$

$$= \sum_{\substack{\sigma \in \mathfrak{S}_n;\\ \operatorname{type} \sigma = \lambda}} \sum_{\substack{w \in \mathfrak{A}^n;\\ \operatorname{std} w = \sigma^{-1}}} \mathbf{x}_w.$$

Comparing this with

$$\underbrace{\sum_{\substack{\sigma \in \mathfrak{S}_n;\\ \sigma \text{ has cycle type } \lambda}}}_{\substack{= \sum_{\substack{\sigma \in \mathfrak{S}_n;\\ \operatorname{type} \sigma = \lambda}} \\ \text{(since } \operatorname{type} \sigma \text{ means} \\ \text{the cycle type of } \sigma)}} \underbrace{L_{\gamma(\sigma)}}_{\substack{= \sum_{\substack{w \in \mathfrak{A}^n;\\ \operatorname{std} w = \sigma^{-1}}} \mathbf{x}_w \\ \text{(by Lemma 5.3.6)}}} = \sum_{\substack{\sigma \in \mathfrak{S}_n;\\ \operatorname{type} \sigma = \lambda}} \sum_{\substack{w \in \mathfrak{A}^n;\\ \operatorname{std} w = \sigma^{-1}}} \mathbf{x}_w,$$

we obtain

$$\mathbf{GR}_\lambda = \sum_{\substack{\sigma \in \mathfrak{S}_n; \\ \sigma \text{ has cycle type } \lambda}} L_{\gamma(\sigma)}.$$

This proves Proposition 6.6.40. □

Next, we can prove Proposition 6.6.42:

Proof of Proposition 6.6.42. Let $n \in \mathbb{N}$. Then, the cycle type of any permutation $\sigma \in \mathfrak{S}_n$ is a partition of n. Hence, we can split up the sum

$$\sum_{\sigma \in \mathfrak{S}_n} L_{\gamma(\sigma)}(\mathbf{x})\, p_{\operatorname{type}\sigma}(\mathbf{y})$$

according to the cycle type of σ. We thus obtain

$$\sum_{\sigma \in \mathfrak{S}_n} L_{\gamma(\sigma)}(\mathbf{x})\, p_{\operatorname{type}\sigma}(\mathbf{y}) = \sum_{\lambda \text{ is a partition of } n} \sum_{\substack{\sigma \in \mathfrak{S}_n; \\ \sigma \text{ has cycle type } \lambda}} L_{\gamma(\sigma)}(\mathbf{x})\, p_{\operatorname{type}\sigma}(\mathbf{y}). \tag{13.192.39}$$

But if λ is a partition satisfying $|\lambda| = n$, then

$$\mathbf{GR}_\lambda(\mathbf{x}) = \mathbf{GR}_\lambda = \sum_{\substack{\sigma \in \mathfrak{S}_n; \\ \sigma \text{ has cycle type } \lambda}} \underbrace{L_{\gamma(\sigma)}}_{= L_{\gamma(\sigma)}(\mathbf{x})} \qquad \text{(by Proposition 6.6.40)}$$

$$= \sum_{\substack{\sigma \in \mathfrak{S}_n; \\ \sigma \text{ has cycle type } \lambda}} L_{\gamma(\sigma)}(\mathbf{x}). \tag{13.192.40}$$

Hence, (13.192.39) becomes

$$\sum_{\sigma \in \mathfrak{S}_n} L_{\gamma(\sigma)}(\mathbf{x})\, p_{\operatorname{type}\sigma}(\mathbf{y})$$

$$= \sum_{\lambda \text{ is a partition of } n} \sum_{\substack{\sigma \in \mathfrak{S}_n; \\ \sigma \text{ has cycle type } \lambda}} L_{\gamma(\sigma)}(\mathbf{x}) \underbrace{p_{\operatorname{type}\sigma}(\mathbf{y})}_{\substack{= p_\lambda(\mathbf{y}) \\ \text{(since } \operatorname{type}\sigma = \lambda \\ \text{(since } \sigma \text{ has cycle type } \lambda\text{))}}}$$

$$= \sum_{\lambda \text{ is a partition of } n} \underbrace{\sum_{\substack{\sigma \in \mathfrak{S}_n; \\ \sigma \text{ has cycle type } \lambda}} L_{\gamma(\sigma)}(\mathbf{x})}_{\substack{= \mathbf{GR}_\lambda(\mathbf{x}) \\ \text{(by (13.192.40))}}} p_\lambda(\mathbf{y})$$

$$= \sum_{\lambda \text{ is a partition of } n} \mathbf{GR}_\lambda(\mathbf{x})\, p_\lambda(\mathbf{y}). \tag{13.192.41}$$

Now, forget that we fixed n. We thus have proved the equality (13.192.41) for each $n \in \mathbb{N}$. Now,

$$\underbrace{\sum_{\lambda \in \operatorname{Par}}}_{= \sum_{n \in \mathbb{N}} \sum_{\lambda \text{ is a partition of } n}} \mathbf{GR}_\lambda(\mathbf{x})\, p_\lambda(\mathbf{y}) = \sum_{n \in \mathbb{N}} \underbrace{\sum_{\lambda \text{ is a partition of } n} \mathbf{GR}_\lambda(\mathbf{x})\, p_\lambda(\mathbf{y})}_{\substack{= \sum_{\sigma \in \mathfrak{S}_n} L_{\gamma(\sigma)}(\mathbf{x}) p_{\operatorname{type}\sigma}(\mathbf{y}) \\ \text{(by (13.192.41))}}}$$

$$= \underbrace{\sum_{n \in \mathbb{N}} \sum_{\sigma \in \mathfrak{S}_n}}_{\substack{= \sum_{\sigma \in \bigsqcup_{n \in \mathbb{N}} \mathfrak{S}_n} = \sum_{\sigma \in \mathfrak{S}} \\ \text{(since } \bigsqcup_{n \in \mathbb{N}} \mathfrak{S}_n = \mathfrak{S}\text{)}}} L_{\gamma(\sigma)}(\mathbf{x})\, p_{\operatorname{type}\sigma}(\mathbf{y}) = \sum_{\sigma \in \mathfrak{S}} L_{\gamma(\sigma)}(\mathbf{x})\, p_{\operatorname{type}\sigma}(\mathbf{y}).$$

Combining this with the result of Proposition 6.6.38(a), we obtain

$$\sum_{\lambda\in\operatorname{Par}} \mathbf{GR}_\lambda\left(\mathbf{x}\right) p_\lambda\left(\mathbf{y}\right) = \sum_{\lambda\in\operatorname{Par}} p_\lambda\left(\mathbf{x}\right) \mathbf{GR}_\lambda\left(\mathbf{y}\right) = \sum_{\sigma\in\mathfrak{S}} L_{\gamma(\sigma)}\left(\mathbf{x}\right) p_{\operatorname{type}\sigma}\left(\mathbf{y}\right).$$

This proves Proposition 6.6.42. □

We shall prove Proposition 6.6.37 in two different ways. Both of these proofs will rely on the following simple lemma:

Lemma 13.192.13. *Let λ be a partition. Then, the power series $\mathbf{GR}_\lambda$ is homogeneous of degree $|\lambda|$.*

Proof of Lemma 13.192.13. The definition of $\mathbf{GR}_\lambda$ yields

$$\mathbf{GR}_\lambda = \sum_{\substack{w\in\mathfrak{A}^*;\\ \operatorname{CFLtype} w=\lambda}} \mathbf{x}_w. \qquad (13.192.42)$$

Set $n = |\lambda|$.

Let $w \in \mathfrak{A}^*$ be such that $\operatorname{CFLtype} w = \lambda$. Then, Lemma 13.192.9(a) yields $\ell\left(w\right) = |\lambda| = n$, so that $w \in \mathfrak{A}^n$ and thus $w = \left(w_1, w_2, \ldots, w_n\right)$. Hence, the definition of $\mathbf{x}_w$ yields $\mathbf{x}_w = x_{w_1}x_{w_2}\cdots x_{w_n}$. This shows that $\mathbf{x}_w$ is a monomial of degree n.

Forget that we fixed w. We thus have showed that $\mathbf{x}_w$ is a monomial of degree n whenever $w \in \mathfrak{A}^*$ satisfies $\operatorname{CFLtype} w = \lambda$. Hence, $\sum\limits_{\substack{w\in\mathfrak{A}^*;\\ \operatorname{CFLtype} w=\lambda}} \mathbf{x}_w$ is a sum of monomials of degree n. In other words, $\mathbf{GR}_\lambda$ is a sum of monomials of degree n (because of (13.192.42)). Thus, $\mathbf{GR}_\lambda$ is a homogeneous formal power series of degree n. In other words, $\mathbf{GR}_\lambda$ is a homogeneous formal power series of degree $|\lambda|$ (since $n = |\lambda|$). This proves Lemma 13.192.13. □

We can now step to the first proof of Proposition 6.6.37:

First proof of Proposition 6.6.37 (sketched). Lemma 13.192.13 shows that the power series $\mathbf{GR}_\lambda$ is homogeneous of degree $|\lambda|$. Hence, this power series $\mathbf{GR}_\lambda$ is of bounded degree (since any homogeneous power series is of bounded degree). In other words, $\mathbf{GR}_\lambda \in R\left(\mathbf{x}\right)$ (since $R\left(\mathbf{x}\right)$ is the set of all formal power series of bounded degree).

Recall the finitary symmetric group $\mathfrak{S}_{(\infty)}$ defined in Section 2.1; it acts on the ring $R\left(\mathbf{x}\right)$. The ring Λ is the invariant ring $\left\{f \in R\left(\mathbf{x}\right) : \sigma\left(f\right) = f \text{ for all } \sigma \in \mathfrak{S}_{(\infty)}\right\}$ of this action.

We shall now prove that $\sigma\left(f\right) = f$ for each $\sigma \in \mathfrak{S}_{(\infty)}$.

Indeed, let $\sigma \in \mathfrak{S}_{(\infty)}$. Thus, σ is a permutation of the set $\{1, 2, 3, \ldots\}$. In other words, σ is a permutation of the set $\mathfrak{A}$ (since $\mathfrak{A} = \{1, 2, 3, \ldots\}$). In other words, σ is a bijection $\mathfrak{A} \to \mathfrak{A}$.

For any word $w \in \mathfrak{A}^*$, we define a new word $\sigma_{\text{word}}\left(w\right)$ to be the result of applying σ to each letter of w. That is, if $w = \left(w_1, w_2, \ldots, w_n\right)$, then $\sigma_{\text{word}}\left(w\right) = \left(\sigma\left(w_1\right), \sigma\left(w_2\right), \ldots, \sigma\left(w_n\right)\right)$. This defines a map $\mathfrak{A}^* \to \mathfrak{A}^*,\ w \mapsto \sigma_{\text{word}}\left(w\right)$. This map is a bijection (since σ is a bijection). We shall denote this bijection by σ_{word}.

For any necklace N, we define a new necklace $\sigma_{\text{neck}}\left(N\right)$ to be the result of applying this bijection σ_{word} to every word in N. That is, $\sigma_{\text{neck}}\left(N\right) = \left\{\sigma_{\text{word}}\left(w\right) \mid w \in N\right\}$. It is straightforward to see that this set $\sigma_{\text{neck}}\left(N\right)$ is indeed a necklace[1215], and furthermore is aperiodic if and only if N is aperiodic. Thus, we obtain a map $\mathfrak{N}^{\mathfrak{a}} \to \mathfrak{N}^{\mathfrak{a}},\ N \mapsto \sigma_{\text{neck}}\left(N\right)$ (since $\mathfrak{N}^{\mathfrak{a}}$ denotes the set of all aperiodic necklaces). This map is a bijection (since σ_{word} is a bijection). We shall denote this bijection by σ_{neck}.

Finally, for any finite multiset M of aperiodic necklaces, we define a new finite multiset $\sigma_{\text{mul}}\left(M\right)$ of aperiodic necklaces to be the result of applying this bijection σ_{neck} to each necklace in M. That is, $\sigma_{\text{mul}}\left(M\right) = \left(\sigma_{\text{neck}}\right)_* M$, using the notation of Definition 13.191.16. This defines a map $\mathfrak{MN}^{\mathfrak{a}} \to \mathfrak{MN}^{\mathfrak{a}},\ M \mapsto \sigma_{\text{mul}}\left(M\right)$ (since $\mathfrak{MN}^{\mathfrak{a}}$ denotes the set of all finite multisets of aperiodic necklaces). Again, this map is a bijection (since σ_{neck} is a bijection). We shall denote this bijection by σ_{mul}.

It is easy to describe directly what this bijection σ_{mul} does to any given multiset: If $M \in \mathfrak{MN}^{\mathfrak{a}}$, then $\sigma_{\text{mul}}\left(M\right)$ is obtained from M by applying σ to each letter of each word in each necklace in M. Hence, it is

[1215] Indeed, the bijection σ_{word} commutes with the actions of C on $\mathfrak{A}^1, \mathfrak{A}^2, \mathfrak{A}^3, \ldots$.

straightforward to see that each $M \in \mathfrak{MN}^{\mathfrak{a}}$ satisfies

$$\mathbf{x}_{\sigma_{\mathrm{mul}}(M)} = \sigma\left(\mathbf{x}_M\right) \tag{13.192.43}$$

and

$$\operatorname{type}\left(\sigma_{\mathrm{mul}}\left(M\right)\right) = \operatorname{type} M. \tag{13.192.44}$$

But Proposition 6.6.48 yields

$$\begin{aligned}
\mathbf{GR}_\lambda &= \sum_{\substack{M\in\mathfrak{MN}^{\mathfrak{a}};\\ \operatorname{type} M=\lambda}} \mathbf{x}_M = \underbrace{\sum_{\substack{M\in\mathfrak{MN}^{\mathfrak{a}};\\ \operatorname{type}(\sigma_{\mathrm{mul}}(M))=\lambda}}}_{\substack{=\sum_{\substack{M\in\mathfrak{MN}^{\mathfrak{a}};\\ \operatorname{type} M=\lambda}}\\ \text{(since each } M\in\mathfrak{MN}^{\mathfrak{a}} \text{ satisfies (13.192.44))}}} \underbrace{\mathbf{x}_{\sigma_{\mathrm{mul}}(M)}}_{\substack{=\sigma(\mathbf{x}_M)\\ \text{(by (13.192.43))}}} \\
&\qquad \left(\begin{array}{c}\text{here, we have substituted } \sigma_{\mathrm{mul}}\left(M\right) \text{ for } M \text{ in the sum,}\\ \text{since the map } \sigma_{\mathrm{mul}} : \mathfrak{MN}^{\mathfrak{a}} \to \mathfrak{MN}^{\mathfrak{a}} \text{ is a bijection}\end{array}\right) \\
&= \sum_{\substack{M\in\mathfrak{MN}^{\mathfrak{a}};\\ \operatorname{type} M=\lambda}} \sigma\left(\mathbf{x}_M\right) = \sigma\left(\underbrace{\sum_{\substack{M\in\mathfrak{MN}^{\mathfrak{a}};\\ \operatorname{type} M=\lambda}} \mathbf{x}_M}_{\substack{=\mathbf{GR}_\lambda\\ \text{(by Proposition 6.6.48)}}}\right) = \sigma\left(\mathbf{GR}_\lambda\right).
\end{aligned}$$

In other words, $\sigma\left(\mathbf{GR}_\lambda\right) = \mathbf{GR}_\lambda$.

Now, forget that we fixed σ. We thus have showed that $\sigma\left(\mathbf{GR}_\lambda\right) = \mathbf{GR}_\lambda$ for all $\sigma \in \mathfrak{S}_{(\infty)}$. Hence, $\mathbf{GR}_\lambda$ is an $f \in R\left(\mathbf{x}\right)$ that satisfies $\sigma\left(f\right) = f$ for all $\sigma \in \mathfrak{S}_{(\infty)}$ (since we already know that $\mathbf{GR}_\lambda \in R\left(\mathbf{x}\right)$). In other words, $\mathbf{GR}_\lambda \in \left\{f \in R\left(\mathbf{x}\right) : \sigma\left(f\right) = f \text{ for all } \sigma \in \mathfrak{S}_{(\infty)}\right\}$. In other words, $\mathbf{GR}_\lambda \in \Lambda$ (since $\Lambda = \left\{f \in R\left(\mathbf{x}\right) : \sigma\left(f\right) = f \text{ for all } \sigma \in \mathfrak{S}_{(\infty)}\right\}$). This proves Proposition 6.6.37. □

Our next proof of Proposition 6.6.37 will rely on two lemmas:

Lemma 13.192.14. *Let λ be a partition. Then, the power series p_λ is homogeneous of degree $\left|\lambda\right|$.*

Proof of Lemma 13.192.14. Let $\ell = \ell\left(\lambda\right)$; thus, $\lambda = \left(\lambda_1, \lambda_2, \ldots, \lambda_\ell\right)$ and $p_\lambda = p_{\lambda_1} p_{\lambda_2} \cdots p_{\lambda_\ell}$ (by the definition of p_λ). From $\lambda = \left(\lambda_1, \lambda_2, \ldots, \lambda_\ell\right)$, we obtain $\left|\lambda\right| = \lambda_1 + \lambda_2 + \cdots + \lambda_\ell$.

But the power-sum symmetric functions $p_{\lambda_1}, p_{\lambda_2}, \ldots, p_{\lambda_\ell}$ are homogeneous of degrees $\lambda_1, \lambda_2, \ldots, \lambda_\ell$, respectively (since each power-sum symmetric function p_n is homogeneous of degree n). Hence, their product $p_{\lambda_1} p_{\lambda_2} \cdots p_{\lambda_\ell}$ is homogeneous of degree $\lambda_1 + \lambda_2 + \cdots + \lambda_\ell$ (since Λ is a graded $\mathbf{k}$-algebra). In view of $p_\lambda = p_{\lambda_1} p_{\lambda_2} \cdots p_{\lambda_\ell}$ and $\left|\lambda\right| = \lambda_1 + \lambda_2 + \cdots + \lambda_\ell$, this rewrites as follows:

$$p_\lambda \text{ is homogeneous of degree } \left|\lambda\right|.$$

This proves Lemma 13.192.14. □

Lemma 13.192.15. *Let A be a commutative $\mathbf{k}$-algebra. Let $\left(a_\lambda\right)_{\lambda\in\operatorname{Par}} \in \left(\mathbf{k}\left[\left[\mathbf{x}\right]\right]\right)^{\operatorname{Par}}$ and $\left(b_\lambda\right)_{\lambda\in\operatorname{Par}} \in \left(\mathbf{k}\left[\left[\mathbf{x}\right]\right]\right)^{\operatorname{Par}}$ be two families of power series in $\mathbf{k}\left[\left[\mathbf{x}\right]\right]$, and let $\left(u_\lambda\right)_{\lambda\in\operatorname{Par}} \in A^{\operatorname{Par}}$ and $\left(v_\lambda\right)_{\lambda\in\operatorname{Par}} \in A^{\operatorname{Par}}$ be two families of elements of A. Assume that the following four conditions are satisfied:*

Assumption 1: If $\lambda \in \operatorname{Par}$, then both power series a_λ and b_λ are homogeneous of degree $\left|\lambda\right|$.

Assumption 2: The family $\left(u_\lambda\right)_{\lambda\in\operatorname{Par}}$ is $\mathbf{k}$-linearly independent.

Assumption 3: We have[1216]

$$\sum_{\lambda\in\operatorname{Par}} u_\lambda a_\lambda = \sum_{\lambda\in\operatorname{Par}} v_\lambda b_\lambda \tag{13.192.45}$$

[1216] The products $u_\lambda a_\lambda$ and $v_\lambda b_\lambda$ in the following equation are taken in the power series ring $A\left[\left[\mathbf{x}\right]\right] = A\left[\left[x_1, x_2, x_3, \ldots\right]\right]$. (Indeed, u_λ and v_λ belong to A and thus to $A\left[\left[\mathbf{x}\right]\right]$ as well, whereas a_λ and b_λ are elements of $\mathbf{k}\left[\left[\mathbf{x}\right]\right]$. Hence, the products $u_\lambda a_\lambda$ and $v_\lambda b_\lambda$ make sense because $A\left[\left[\mathbf{x}\right]\right]$ is canonically a $\mathbf{k}\left[\left[\mathbf{x}\right]\right]$-module.)

[1217] *in the power series ring* $A[[\mathbf{x}]] = A[[x_1, x_2, x_3, \ldots]]$.

Assumption 4: We have $b_\lambda \in \Lambda$ *for each* $\lambda \in \operatorname{Par}$.

Then, $a_\lambda \in \Lambda$ *for each* $\lambda \in \operatorname{Par}$.

Proof of Lemma 13.192.15. In this proof, the word "monomial" always means a monomial in the indeterminates $x_1, x_2, x_3, \ldots$. Any formal power series in $\mathbf{k}[[\mathbf{x}]]$ is an infinite $\mathbf{k}$-linear combination of monomials, whereas any formal power series in $A[[\mathbf{x}]]$ is an infinite A-linear combination of monomials.

Each monomial $\mathfrak{m} = x_1^{r_1} x_2^{r_2} x_3^{r_3} \cdots$ has a well-defined degree $\deg \mathfrak{m}$, namely $\deg \mathfrak{m} = r_1 + r_2 + r_3 + \cdots$. Recall that a formal power series $f \in A[[\mathbf{x}]]$ is said to be *homogeneous of degree* n (for some $n \in \mathbb{N}$) if it is an infinite A-linear combination of monomials that have degree n. Thus, in particular, an element of A (when regarded as a formal power series in $A[[\mathbf{x}]]$) is always homogeneous of degree 0.

Consider the (unique) $\mathbf{k}$-algebra homomorphism $\iota : \mathbf{k} \to A$ (which comes from the fact that A is a $\mathbf{k}$-algebra). This homomorphism $\iota : \mathbf{k} \to A$ is injective[1218]. Hence, the canonical $\mathbf{k}[[\mathbf{x}]]$-algebra homomorphism $\iota[[\mathbf{x}]] : \mathbf{k}[[\mathbf{x}]] \to A[[\mathbf{x}]]$ induced by it (which simply applies ι to each coefficient of a power series) must also be injective. We shall thus identify $\mathbf{k}[[\mathbf{x}]]$ with a subring of $A[[\mathbf{x}]]$ (via the latter $\mathbf{k}[[\mathbf{x}]]$-algebra homomorphism $\iota[[\mathbf{x}]]$).

We shall now prove a few auxiliary claims:

Claim 1: Let $n \in \mathbb{N}$. Then,

$$\sum_{\lambda \in \operatorname{Par}_n} u_\lambda a_\lambda = \sum_{\lambda \in \operatorname{Par}_n} v_\lambda b_\lambda.$$

[*Proof of Claim 1:* Let π_n denote the map $A[[\mathbf{x}]] \to A[[\mathbf{x}]]$ that sends each formal power series $f \in A[[\mathbf{x}]]$ to its n-th homogeneous component. Explicitly, this map π_n is given by

$$\pi_n \left(\sum_{\mathfrak{m} \text{ is a monomial}} \alpha_{\mathfrak{m}} \mathfrak{m} \right) = \sum_{\substack{\mathfrak{m} \text{ is a monomial;} \\ \deg \mathfrak{m} = n}} \alpha_{\mathfrak{m}} \mathfrak{m} \qquad \text{for all } \sum_{\mathfrak{m} \text{ is a monomial}} \alpha_{\mathfrak{m}} \mathfrak{m} \in A[[\mathbf{x}]] \text{ (with } \alpha_m \in A).$$

This map π_n is A-linear and continuous (with respect to the topology on $A[[\mathbf{x}]]$); thus, it respects infinite sums. Moreover, it sends each a_λ (with $\lambda \in \operatorname{Par}$) to $\begin{cases} a_\lambda, & \text{if } |\lambda| = n; \\ 0, & \text{if } |\lambda| \neq n \end{cases}$ (since Assumption 1 shows that a_λ is

[1217] Both sums $\sum_{\lambda \in \operatorname{Par}} u_\lambda a_\lambda$ and $\sum_{\lambda \in \operatorname{Par}} v_\lambda b_\lambda$ converge (with respect to the standard topology on $A[[\mathbf{x}]]$). Here is why:

Fix $n \in \mathbb{N}$. For each $\lambda \in \operatorname{Par}$, the power series $a_\lambda \in \mathbf{k}[[\mathbf{x}]]$ is homogeneous of degree $|\lambda|$ (by Assumption 1), and thus the power series $u_\lambda a_\lambda \in A[[\mathbf{x}]]$ is also homogeneous of degree $|\lambda|$ (since the factor u_λ belongs to A and therefore does not affect the degree). Hence, for each $\lambda \in \operatorname{Par}$, the power series $u_\lambda a_\lambda$ contains no degree-n monomials unless $|\lambda| = n$. Thus, there are only finitely many $\lambda \in \operatorname{Par}$ such that the power series $u_\lambda a_\lambda$ contains degree-n monomials (because there are only finitely many $\lambda \in \operatorname{Par}$ such that $|\lambda| = n$).

Forget that we fixed n. We thus have shown that, for each $n \in \mathbb{N}$, there are only finitely many $\lambda \in \operatorname{Par}$ such that the power series $u_\lambda a_\lambda$ contains degree-n monomials. In other words, for each $n \in \mathbb{N}$, there are only finitely many addends in the sum $\sum_{\lambda \in \operatorname{Par}} u_\lambda a_\lambda$ that contain degree-n monomials. Therefore, this sum $\sum_{\lambda \in \operatorname{Par}} u_\lambda a_\lambda$ converges. Similarly, the sum $\sum_{\lambda \in \operatorname{Par}} v_\lambda b_\lambda$ converges. Qed.

[1218] *Proof.* Let $c \in \operatorname{Ker} \iota$. Thus, $c \in \mathbf{k}$ and $\iota(c) = 0$. The definition of ι yields $\iota(c) = c \cdot 1_A$. Hence, $c \cdot 1_A = \iota(c) = 0$.

Consider the empty partition $\varnothing \in \operatorname{Par}$. We have $u_\varnothing \in A$ and $c \underbrace{u_\varnothing}_{= 1_A \cdot u_\varnothing} = \underbrace{c \cdot 1_A}_{= 0} \cdot u_\varnothing = 0$.

The empty partition $\varnothing$ satisfies $\{\varnothing\} \subset \operatorname{Par}$. Hence, the family $(u_\lambda)_{\lambda \in \{\varnothing\}}$ (which consists of the single element $u_\varnothing$) is a subfamily of the family $(u_\lambda)_{\lambda \in \operatorname{Par}}$. Thus, the former family is $\mathbf{k}$-linearly independent (since Assumption 2 says that the latter family is $\mathbf{k}$-linearly independent). In other words, if $(j_\lambda)_{\lambda \in \{\varnothing\}} \in \mathbf{k}^{\{\varnothing\}}$ is a family of elements of $\mathbf{k}$ such that $\sum_{\lambda \in \{\varnothing\}} j_\lambda u_\lambda = 0$, then

$$(j_\lambda = 0 \text{ for each } \lambda \in \{\varnothing\}).$$

We can apply this to $(j_\lambda)_{\lambda \in \{\varnothing\}} = (c)_{\lambda \in \{\varnothing\}}$ (since $\sum_{\lambda \in \{\varnothing\}} c u_\lambda = c u_\varnothing = 0$), and thus conclude that

$$(c = 0 \text{ for each } \lambda \in \{\varnothing\}).$$

Applying this to $\lambda = \varnothing$, we obtain $c = 0$ (since $\varnothing \in \{\varnothing\}$).

Now, forget that we fixed c. We thus have shown that $c = 0$ for each $c \in \operatorname{Ker} \iota$. In other words, $\operatorname{Ker} \iota = 0$. Thus, ι is injective (since ι is a ring homomorphism). Qed.

homogeneous of degree $|\lambda|$), and sends each b_λ to $\begin{cases} b_\lambda, & \text{if } |\lambda| = n; \\ 0, & \text{if } |\lambda| \neq n \end{cases}$ (for similar reasons). Thus, applying π_n to both sides of (13.192.45), we obtain

$$\sum_{\lambda \in \operatorname{Par}_n} u_\lambda a_\lambda = \sum_{\lambda \in \operatorname{Par}_n} v_\lambda b_\lambda.$$

This proves Claim 1.]

Claim 2: Let $n \in \mathbb{N}$. Let $(c_\lambda)_{\lambda \in \operatorname{Par}_n} \in (\mathbf{k}[[\mathbf{x}]])^{\operatorname{Par}_n}$ be a family of elements of $\mathbf{k}[[\mathbf{x}]]$ such that

$$\sum_{\lambda \in \operatorname{Par}_n} u_\lambda c_\lambda = 0. \tag{13.192.46}$$

Then, $c_\lambda = 0$ for each $\lambda \in \operatorname{Par}_n$.

[*Proof of Claim 2:* For each $\lambda \in \operatorname{Par}_n$, let us write the formal power series $c_\lambda \in \mathbf{k}[[\mathbf{x}]]$ in the form

$$c_\lambda = \sum_{\mathfrak{m} \text{ is a monomial}} c_{\lambda,\mathfrak{m}} \mathfrak{m} \qquad \text{for some } c_{\lambda,\mathfrak{m}} \in \mathbf{k}. \tag{13.192.47}$$

Now, fix any monomial $\mathfrak{n}$. Then, (13.192.46) yields

$$0 = \sum_{\lambda \in \operatorname{Par}_n} u_\lambda \underbrace{c_\lambda}_{\substack{= \sum_{\mathfrak{m} \text{ is a monomial}} c_{\lambda,\mathfrak{m}} \mathfrak{m} \\ \text{(by (13.192.47))}}} = \sum_{\lambda \in \operatorname{Par}_n} u_\lambda \sum_{\mathfrak{m} \text{ is a monomial}} c_{\lambda,\mathfrak{m}} \mathfrak{m} = \sum_{\mathfrak{m} \text{ is a monomial}} \sum_{\lambda \in \operatorname{Par}_n} c_{\lambda,\mathfrak{m}} u_\lambda \mathfrak{m}.$$

Comparing coefficients of $\mathfrak{n}$ on both sides of this equality, we obtain $0 = \sum_{\lambda \in \operatorname{Par}_n} c_{\lambda,\mathfrak{n}} u_\lambda$. In other words,

$$\sum_{\lambda \in \operatorname{Par}_n} c_{\lambda,\mathfrak{n}} u_\lambda = 0. \tag{13.192.48}$$

But the family $(u_\lambda)_{\lambda \in \operatorname{Par}}$ is $\mathbf{k}$-linearly independent (by Assumption 2). Hence, its subfamily $(u_\lambda)_{\lambda \in \operatorname{Par}_n}$ is $\mathbf{k}$-linearly independent as well. Thus, from (13.192.48), we conclude that

$$c_{\lambda,\mathfrak{n}} = 0 \text{ for each } \lambda \in \operatorname{Par}_n \tag{13.192.49}$$

(since $c_{\lambda,\mathfrak{n}} \in \mathbf{k}$ for each $\lambda \in \operatorname{Par}_n$).

Forget that we fixed $\mathfrak{n}$. We thus have proved (13.192.49) for each monomial $\mathfrak{n}$. Now, fix $\lambda \in \operatorname{Par}_n$. Then, (13.192.47) yields

$$c_\lambda = \sum_{\mathfrak{m} \text{ is a monomial}} \underbrace{c_{\lambda,\mathfrak{m}}}_{\substack{=0 \\ \text{(by (13.192.49), applied to } \mathfrak{n}=\mathfrak{m})}} \mathfrak{m} = 0.$$

This proves Claim 2.]

Recall the finitary symmetric group $\mathfrak{S}_{(\infty)}$ defined in Section 2.1. It acts on the rings $R(\mathbf{x})$ and $\mathbf{k}[[\mathbf{x}]]$ and $A[[\mathbf{x}]]$ in the same way (viz., by permuting the variables $x_1, x_2, x_3, \ldots$). The ring Λ is the invariant ring $\left\{ f \in R(\mathbf{x}) : \sigma(f) = f \text{ for all } \sigma \in \mathfrak{S}_{(\infty)} \right\}$ of its action on $R(\mathbf{x})$. Of course, $R(\mathbf{x})$ is an $\mathfrak{S}_{(\infty)}$-subset of $\mathbf{k}[[\mathbf{x}]]$. Moreover, the canonical $\mathbf{k}[[\mathbf{x}]]$-algebra homomorphism $\iota[[\mathbf{x}]] : \mathbf{k}[[\mathbf{x}]] \to A[[\mathbf{x}]]$ (which we are using to identify $\mathbf{k}[[\mathbf{x}]]$ with a subring of $A[[\mathbf{x}]]$) is $\mathfrak{S}_{(\infty)}$-equivariant. This ensures that expressions like $\sigma(a_\lambda)$ (for $\sigma \in \mathfrak{S}_{(\infty)}$ and $\lambda \in \operatorname{Par}$) are well-defined (i.e., they don't depend on whether we regard a_λ as an element of $\mathbf{k}[[\mathbf{x}]]$ or as an element of $A[[\mathbf{x}]]$).

We now claim:

Claim 3: Let $n \in \mathbb{N}$. Let $\lambda \in \operatorname{Par}_n$. Then, $\sigma(b_\lambda) = b_\lambda$ for all $\sigma \in \mathfrak{S}_{(\infty)}$.

[*Proof of Claim 3:* Assumption 4 yields $b_\lambda \in \Lambda = \left\{ f \in R(\mathbf{x}) : \sigma(f) = f \text{ for all } \sigma \in \mathfrak{S}_{(\infty)} \right\}$. Hence, $\sigma(b_\lambda) = b_\lambda$ for all $\sigma \in \mathfrak{S}_{(\infty)}$. This proves Claim 3.]

Claim 4: Let $\sigma \in \mathfrak{S}_{(\infty)}$. Then, $\sigma(a_\mu) = a_\mu$ for each $\mu \in \operatorname{Par}$.

[*Proof of Claim 4:* Let $\mu \in \operatorname{Par}$. Set $n = |\mu|$. Then, $\mu \in \operatorname{Par}_n$ (since $\mu \in \operatorname{Par}$ and $|\mu| = n$).

Recall that $(u_\lambda)_{\lambda \in \operatorname{Par}} \in A^{\operatorname{Par}}$. Hence, $u_\lambda \in A$ for each $\lambda \in \operatorname{Par}_n$. Likewise, $v_\lambda \in A$ for each $\lambda \in \operatorname{Par}_n$. Also, recall that $(a_\lambda)_{\lambda \in \operatorname{Par}} \in (\mathbf{k}[[\mathbf{x}]])^{\operatorname{Par}}$. Hence, each $\lambda \in \operatorname{Par}_n$ satisfies $a_\lambda \in \mathbf{k}[[\mathbf{x}]]$ and thus $\sigma(a_\lambda) - a_\lambda \in \mathbf{k}[[\mathbf{x}]]$. In other words, $(\sigma(a_\lambda) - a_\lambda)_{\lambda \in \operatorname{Par}_n} \in (\mathbf{k}[[\mathbf{x}]])^{\operatorname{Par}_n}$.

Claim 1 yields

$$\sum_{\lambda\in\operatorname{Par}_n} u_\lambda a_\lambda = \sum_{\lambda\in\operatorname{Par}_n} v_\lambda b_\lambda . \tag{13.192.50}$$

Note that we can regard the (finite) sum $\sum_{\lambda\in\operatorname{Par}_n} u_\lambda a_\lambda$ as an A-linear combination of the elements $a_\lambda \in A[[\mathbf{x}]]$ [1219] with coefficients $u_\lambda \in A$. Likewise, we can regard the (finite) sum $\sum_{\lambda\in\operatorname{Par}_n} v_\lambda b_\lambda$ as an A-linear combination of the elements $b_\lambda \in A[[\mathbf{x}]]$ with coefficients $v_\lambda \in A$.

But the group $\mathfrak{S}_{(\infty)}$ acts on $A[[\mathbf{x}]]$ by A-linear maps. Thus, the map $A[[\mathbf{x}]] \to A[[\mathbf{x}]]$, $f \mapsto \sigma(f)$ is A-linear. Hence, this map respects A-linear combinations. Consequently,

$$\sigma\left(\sum_{\lambda\in\operatorname{Par}_n} u_\lambda a_\lambda\right) = \sum_{\lambda\in\operatorname{Par}_n} u_\lambda \sigma(a_\lambda) \qquad \text{(since } u_\lambda \in A \text{ for each } \lambda \in \operatorname{Par}_n\text{)}$$

and

$$\begin{aligned}\sigma\left(\sum_{\lambda\in\operatorname{Par}_n} v_\lambda b_\lambda\right) &= \sum_{\lambda\in\operatorname{Par}_n} v_\lambda \underbrace{\sigma(b_\lambda)}_{\substack{=b_\lambda\\ \text{(by Claim 3)}}} \qquad \text{(since } v_\lambda \in A \text{ for each } \lambda \in \operatorname{Par}_n\text{)}\\ &= \sum_{\lambda\in\operatorname{Par}_n} v_\lambda b_\lambda = \sum_{\lambda\in\operatorname{Par}_n} u_\lambda a_\lambda \qquad \text{(by (13.192.50))}.\end{aligned}$$

Subtracting these two equalities, we find

$$\sigma\left(\sum_{\lambda\in\operatorname{Par}_n} u_\lambda a_\lambda\right) - \sigma\left(\sum_{\lambda\in\operatorname{Par}_n} v_\lambda b_\lambda\right) = \sum_{\lambda\in\operatorname{Par}_n} u_\lambda \sigma(a_\lambda) - \sum_{\lambda\in\operatorname{Par}_n} u_\lambda a_\lambda = \sum_{\lambda\in\operatorname{Par}_n} u_\lambda (\sigma(a_\lambda) - a_\lambda).$$

Hence,

$$\begin{aligned}\sum_{\lambda\in\operatorname{Par}_n} u_\lambda (\sigma(a_\lambda) - a_\lambda) &= \sigma\left(\underbrace{\sum_{\lambda\in\operatorname{Par}_n} u_\lambda a_\lambda}_{\substack{=\sum_{\lambda\in\operatorname{Par}_n} v_\lambda b_\lambda\\ \text{(by Claim 1)}}}\right) - \sigma\left(\sum_{\lambda\in\operatorname{Par}_n} v_\lambda b_\lambda\right)\\ &= \sigma\left(\sum_{\lambda\in\operatorname{Par}_n} v_\lambda b_\lambda\right) - \sigma\left(\sum_{\lambda\in\operatorname{Par}_n} v_\lambda b_\lambda\right) = 0.\end{aligned}$$

Hence, Claim 2 (applied to $c_\lambda = \sigma(a_\lambda) - a_\lambda$) yields that $\sigma(a_\lambda) - a_\lambda = 0$ for each $\lambda \in \operatorname{Par}_n$ (since $(\sigma(a_\lambda) - a_\lambda)_{\lambda\in\operatorname{Par}_n} \in (\mathbf{k}[[\mathbf{x}]])^{\operatorname{Par}_n}$). Applying this to $\lambda = \mu$, we obtain $\sigma(a_\mu) - a_\mu = 0$ (since $\mu \in \operatorname{Par}_n$). In other words, $\sigma(a_\mu) = a_\mu$. This proves Claim 4.]

Claim 5: We have $a_\mu \in \Lambda$ for each $\mu \in \operatorname{Par}$.

[*Proof of Claim 5:* Let $\mu \in \operatorname{Par}$. Thus, $a_\mu \in \mathbf{k}[[\mathbf{x}]]$ (since $(a_\lambda)_{\lambda\in\operatorname{Par}} \in (\mathbf{k}[[\mathbf{x}]])^{\operatorname{Par}}$). Also, Assumption 1 (applied to $\lambda = \mu$) shows that the power series a_μ is homogeneous of degree $|\mu|$. Hence, this power series a_μ is of bounded degree (since any homogeneous power series is of bounded degree). In other words, $a_\mu \in R(\mathbf{x})$. Claim 4 yields that $\sigma(a_\mu) = a_\mu$ for all $\sigma \in \mathfrak{S}_{(\infty)}$.

Thus, a_μ is an $f \in R(\mathbf{x})$ satisfying $\sigma(f) = f$ for all $\sigma \in \mathfrak{S}_{(\infty)}$. In other words,

$$a_\mu \in \left\{f \in R(\mathbf{x}) : \sigma(f) = f \text{ for all } \sigma \in \mathfrak{S}_{(\infty)}\right\}.$$

In view of $\Lambda = \left\{f \in R(\mathbf{x}) : \sigma(f) = f \text{ for all } \sigma \in \mathfrak{S}_{(\infty)}\right\}$, this rewrites as $a_\mu \in \Lambda$. This proves Claim 5.]

We have $a_\mu \in \Lambda$ for each $\mu \in \operatorname{Par}$ (by Claim 5). Renaming the index μ as λ in this statement, we can rewrite this as follows: We have $a_\lambda \in \Lambda$ for each $\lambda \in \operatorname{Par}$. This proves Lemma 13.192.15. □

[1219] Here, we are using the fact that the a_λ (for $\lambda \in \operatorname{Par}$) are elements of $A[[\mathbf{x}]]$. (This is because they are elements of $\mathbf{k}[[\mathbf{x}]]$, but we are identifying $\mathbf{k}[[\mathbf{x}]]$ with a subring of $A[[\mathbf{x}]]$.)

Second proof of Proposition 6.6.37. We begin with a trick. Recall that there is a canonical ring homomorphism $\varphi : \mathbb{Z} \to \mathbf{k}$. This homomorphism gives rise to a ring homomorphism $\varphi[[\mathbf{x}]] : \mathbb{Z}[[\mathbf{x}]] \to \mathbf{k}[[\mathbf{x}]]$, and this latter homomorphism $\varphi[[\mathbf{x}]]$ sends $\Lambda_{\mathbb{Z}}$ to $\Lambda_{\mathbf{k}}$; that is, we have $(\varphi[[\mathbf{x}]])(\Lambda_{\mathbb{Z}}) \subset \Lambda_{\mathbf{k}}$. Moreover, it is clear that the ring homomorphism $\varphi[[\mathbf{x}]]$ sends the element $\mathbf{GR}_\lambda$ of $\mathbb{Z}[[\mathbf{x}]]$ to the element $\mathbf{GR}_\lambda$ of $\mathbf{k}[[\mathbf{x}]]$ (because the definition of $\mathbf{GR}_\lambda$ is functorial in the base ring $\mathbf{k}$). Therefore, if we can prove that the element $\mathbf{GR}_\lambda$ of $\mathbb{Z}[[\mathbf{x}]]$ belongs to $\Lambda_{\mathbb{Z}}$, then it will automatically follow that the element $\mathbf{GR}_\lambda$ of $\mathbf{k}[[\mathbf{x}]]$ belongs to $(\varphi[[\mathbf{x}]])(\Lambda_{\mathbb{Z}}) \subset \Lambda_{\mathbf{k}}$; this will complete the proof of Proposition 6.6.37. Hence, in order to prove Proposition 6.6.37, it only remains to prove that the element $\mathbf{GR}_\lambda$ of $\mathbb{Z}[[\mathbf{x}]]$ belongs to $\Lambda_{\mathbb{Z}}$. In other words, it only remains to prove Proposition 6.6.37 in the case of $\mathbf{k} = \mathbb{Z}$. Hence, in proving Proposition 6.6.37, we can WLOG assume that $\mathbf{k} = \mathbb{Z}$. Assume this.

Forget that we fixed λ. Consider the countable set of indeterminates $\mathbf{y} = (y_1, y_2, y_3, \ldots)$.

It is easy to see that the family $(p_\lambda)_{\lambda\in\mathrm{Par}} \in (\mathbf{k}[[\mathbf{x}]])^{\mathrm{Par}}$ is $\mathbf{k}$-linearly independent[1220]. Hence, the family $(p_\lambda(\mathbf{y}))_{\lambda\in\mathrm{Par}} \in (\mathbf{k}[[\mathbf{y}]])^{\mathrm{Par}}$ is $\mathbf{k}$-linearly independent[1221]. If $\lambda \in \mathrm{Par}$, then both power series $\mathbf{GR}_\lambda$ and p_λ are homogeneous of degree $|\lambda|$ (by Lemma 13.192.13 and Lemma 13.192.14).

We identify the power series ring $\mathbf{k}[[\mathbf{x},\mathbf{y}]] = \mathbf{k}[[x_1, x_2, x_3, \ldots, y_1, y_2, y_3, \ldots]]$ with the power series ring $(\mathbf{k}[[\mathbf{y}]])[[\mathbf{x}]] = (\mathbf{k}[[y_1, y_2, y_3, \ldots]])[[x_1, x_2, x_3, \ldots]]$. In this power series ring, we have

$$\begin{aligned}\sum_{\lambda\in\mathrm{Par}} p_\lambda(\mathbf{y}) \underbrace{\mathbf{GR}_\lambda}_{=\mathbf{GR}_\lambda(\mathbf{x})} &= \sum_{\lambda\in\mathrm{Par}} p_\lambda(\mathbf{y})\,\mathbf{GR}_\lambda(\mathbf{x}) = \sum_{\lambda\in\mathrm{Par}} \mathbf{GR}_\lambda(\mathbf{x})\, p_\lambda(\mathbf{y}) \\ &= \sum_{\lambda\in\mathrm{Par}} p_\lambda(\mathbf{x})\,\mathbf{GR}_\lambda(\mathbf{y}) \qquad \text{(by Proposition 6.6.38(a))} \\ &= \sum_{\lambda\in\mathrm{Par}} \mathbf{GR}_\lambda(\mathbf{y}) \underbrace{p_\lambda(\mathbf{x})}_{=p_\lambda} = \sum_{\lambda\in\mathrm{Par}} \mathbf{GR}_\lambda(\mathbf{y})\, p_\lambda. \qquad (13.192.51)\end{aligned}$$

Hence, we can apply Lemma 13.192.15 to

$$A = \mathbf{k}[[\mathbf{y}]], \quad a_\lambda = \mathbf{GR}_\lambda, \quad b_\lambda = p_\lambda, \quad u_\lambda = p_\lambda(\mathbf{y}), \quad \text{and} \quad v_\lambda = \mathbf{GR}_\lambda(\mathbf{y}).$$

[1222] Thus, we conclude that $\mathbf{GR}_\lambda \in \Lambda$ for each $\lambda \in \mathrm{Par}$. In other words, the power series $\mathbf{GR}_\lambda$ belongs to Λ for each partition λ. This proves Proposition 6.6.37. □

Finally, let us prove Proposition 6.6.36:

Proof of Proposition 6.6.36. (a) We proceed by showing some auxiliary claims:

> *Claim 1:* Let $w \in \mathfrak{A}^*$ satisfy $\operatorname{CFLtype} w = (n)$. Then, the word w is Lyndon and satisfies $w \in \mathfrak{A}^n$.

[*Proof of Claim 1:* Lemma 13.192.9(a) (applied to $\lambda = (n)$) yields $\ell(w) = |(n)| = n$. Hence, $w \in \mathfrak{A}^n$.

Let $(a_1, a_2, \ldots, a_k)$ be the CFL factorization of w. Thus, $(a_1, a_2, \ldots, a_k)$ is a tuple of Lyndon words satisfying $w = a_1 a_2 \cdots a_k$ and $a_1 \geq a_2 \geq \cdots \geq a_k$ (by the definition of "CFL factorization"). But Lemma 13.192.9(b) (applied to $\lambda = (n)$) yields $k = \ell((n)) = 1$ (since n is a positive integer). Hence, $a_1 a_2 \cdots a_k = a_1$. Thus, $w = a_1 a_2 \cdots a_k = a_1$. But a_1 is a Lyndon word (since $(a_1, a_2, \ldots, a_k)$ is a tuple of Lyndon words). In other words, w is a Lyndon word (since $w = a_1$). Thus, Claim 1 is proven.]

> *Claim 2:* Let $w \in \mathfrak{A}^n$ be a Lyndon word. Then, $w \in \mathfrak{A}^*$ and $\operatorname{CFLtype} w = (n)$.

[1220] *Proof.* We have $\Lambda = \Lambda_{\mathbf{k}} = \Lambda_{\mathbb{Z}}$ (since $\mathbf{k} = \mathbb{Z}$). But $\Lambda_{\mathbb{Z}}$ is clearly a subring of $\Lambda_{\mathbb{Q}}$ (since the ring $\mathbb{Z}[[\mathbf{x}]]$ is a subring of the ring $\mathbb{Q}[[\mathbf{x}]]$, and the finitary symmetric group $\mathfrak{S}_{(\infty)}$ acts in the same way on both of these rings). Furthermore, the symmetric functions e_λ, s_λ and p_λ are defined in the same way over the ring $\mathbb{Z}$ as they are defined over the ring $\mathbb{Q}$.

Now, Proposition 2.2.10 (applied to $\mathbb{Q}$ instead of $\mathbf{k}$) shows that the families $(e_\lambda)_{\lambda\in\mathrm{Par}}$, $(s_\lambda)_{\lambda\in\mathrm{Par}}$ and $(p_\lambda)_{\lambda\in\mathrm{Par}}$ are bases of the $\mathbb{Q}$-module $\Lambda_{\mathbb{Q}}$. Hence, in particular, the family $(p_\lambda)_{\lambda\in\mathrm{Par}}$ is a basis of the $\mathbb{Q}$-module $\Lambda_{\mathbb{Q}}$. Thus, this family is $\mathbb{Q}$-linearly independent, and therefore $\mathbb{Z}$-linearly independent as well (since $\mathbb{Z}$ is a subring of $\mathbb{Q}$). In other words, it is $\mathbf{k}$-linearly independent (since $\mathbf{k} = \mathbb{Z}$). Qed.

[1221] Indeed, the family $(p_\lambda(\mathbf{y}))_{\lambda\in\mathrm{Par}}$ is obtained from the family $(p_\lambda)_{\lambda\in\mathrm{Par}}$ by renaming the indeterminates $x_1, x_2, x_3, \ldots$ as $y_1, y_2, y_3, \ldots$. Thus, the $\mathbf{k}$-linear independence of the latter family implies the $\mathbf{k}$-linear independence of the former.

[1222] Indeed, Assumption 1 of Lemma 13.192.15 is satisfied (because if $\lambda \in \mathrm{Par}$, then both power series $\mathbf{GR}_\lambda$ and p_λ are homogeneous of degree $|\lambda|$); Assumption 2 is satisfied as well (since the family $(p_\lambda(\mathbf{y}))_{\lambda\in\mathrm{Par}} \in (\mathbf{k}[[\mathbf{y}]])^{\mathrm{Par}}$ is $\mathbf{k}$-linearly independent); Assumption 3 is also satisfied (due to (13.192.51)); finally, Assumption 4 is satisfied (since we have $p_\lambda \in \Lambda$ for each $\lambda \in \mathrm{Par}$).

[*Proof of Claim 2:* We have $w \in \mathfrak{A}^n \subset \mathfrak{A}^*$. It remains to prove that $\operatorname{CFLtype} w = (n)$.

The word w is Lyndon. Hence, the definition of a "CFL factorization" shows that the 1-tuple (w) is a CFL factorization of w. We can replace "a CFL factorization" by "the CFL factorization" in this sentence (since Theorem 6.1.27 shows that the CFL factorization of w is unique). Thus, we conclude that the 1-tuple (w) is the CFL factorization of w. Hence, the definition of $\operatorname{CFLtype} w$ shows that

$$\operatorname{CFLtype} w = (\ell(w)) = (n) \qquad \left(\text{since } \ell(w) = n \text{ (because } w \in \mathfrak{A}^n)\right).$$

This concludes the proof of Claim 2.]

Claim 3: We have $\{w \in \mathfrak{A}^* \mid \operatorname{CFLtype} w = (n)\} = \{w \in \mathfrak{A}^n \mid w \text{ is Lyndon}\}$.

[*Proof of Claim 3:* Claim 1 shows that $\{w \in \mathfrak{A}^* \mid \operatorname{CFLtype} w = (n)\} \subset \{w \in \mathfrak{A}^n \mid w \text{ is Lyndon}\}$. Claim 2 shows that $\{w \in \mathfrak{A}^n \mid w \text{ is Lyndon}\} \subset \{w \in \mathfrak{A}^* \mid \operatorname{CFLtype} w = (n)\}$. Combining these two inclusions, we obtain precisely the equality claimed in Claim 3.]

The definition of $\mathbf{GR}_{(n)}$ yields

$$\mathbf{GR}_{(n)} = \underbrace{\sum_{\substack{w \in \mathfrak{A}^*; \\ \operatorname{CFLtype} w = (n)}}}_{\substack{= \sum_{\substack{w \in \mathfrak{A}^n; \\ w \text{ is Lyndon}}} \\ \text{(by Claim 3)}}} \mathbf{x}_w = \sum_{\substack{w \in \mathfrak{A}^n; \\ w \text{ is Lyndon}}} \mathbf{x}_w.$$

This proves Proposition 6.6.36(a).

(b) Forget that we fixed n. We shall first prove several auxiliary claims:

Claim 4: Let d be a positive integer. Then,

$$\{w \in \mathfrak{L} \mid \ell(w) = d\} = \left\{w \in \mathfrak{A}^d \mid w \text{ is Lyndon}\right\}.$$

[*Proof of Claim 4:* Since $\mathfrak{L}$ is the set of all Lyndon words in $\mathfrak{A}^*$, we have

$$\begin{aligned}\{w \in \mathfrak{L} \mid \ell(w) = d\} &= \{w \text{ is a Lyndon word in } \mathfrak{A}^* \mid \ell(w) = d\} \\ &= \{w \in \mathfrak{A}^* \mid w \text{ is Lyndon, and } \ell(w) = d\}.\end{aligned}$$

But since $\mathfrak{A}^d$ is the set of words $w \in \mathfrak{A}^*$ satisfying $\ell(w) = d$, we have

$$\begin{aligned}\left\{w \in \mathfrak{A}^d \mid w \text{ is Lyndon}\right\} &= \{w \in \mathfrak{A}^* \text{ satisfying } \ell(w) = d \mid w \text{ is Lyndon}\} \\ &= \{w \in \mathfrak{A}^* \mid w \text{ is Lyndon, and } \ell(w) = d\}.\end{aligned}$$

Comparing these two equalities, we obtain $\{w \in \mathfrak{L} \mid \ell(w) = d\} = \left\{w \in \mathfrak{A}^d \mid w \text{ is Lyndon}\right\}$. This proves Claim 4.]

Claim 5: Let $w \in \mathfrak{L}$. Then, $\ell(w) \in \{1, 2, 3, \ldots\}$.

[*Proof of Claim 5:* From $w \in \mathfrak{L}$, we conclude that w is a Lyndon word in $\mathfrak{A}^*$ (since $\mathfrak{L}$ is the set of Lyndon words in $\mathfrak{A}^*$). Hence, the word w is Lyndon, and thus nonempty. Therefore, $\ell(w) \in \{1, 2, 3, \ldots\}$. This proves Claim 5.]

The next two claims concern the results of substituting $x_1^k, x_2^k, x_3^k, \ldots$ for $x_1, x_2, x_3, \ldots$ in some power series $f \in \mathbf{k}[[\mathbf{x}]]$ (where k is a given positive integer). Recall that the result of substituting $x_1^k, x_2^k, x_3^k, \ldots$ for $x_1, x_2, x_3, \ldots$ in a power series $f \in \mathbf{k}[[\mathbf{x}]]$ is denoted by $f\left(x_1^k, x_2^k, x_3^k, \ldots\right)$.

Claim 6: Let k be a positive integer. Let $w \in \mathfrak{A}^*$. Then,

$$\mathbf{x}_w\left(x_1^k, x_2^k, x_3^k, \ldots\right) = \mathbf{x}_w^k$$

(where, of course, $\mathbf{x}_w\left(x_1^k, x_2^k, x_3^k, \ldots\right)$ denotes the result of substituting $x_1^k, x_2^k, x_3^k, \ldots$ for $x_1, x_2, x_3, \ldots$ in the polynomial $\mathbf{x}_w$).

[*Proof of Claim 6:* Write the word w in the form $w = (w_1, w_2, \ldots, w_n)$ (for some $n \in \mathbb{N}$). Then, $\mathbf{x}_w = x_{w_1} x_{w_2} \cdots x_{w_n}$ (by the definition of $\mathbf{x}_w$). Substituting $x_1^k, x_2^k, x_3^k, \ldots$ for $x_1, x_2, x_3, \ldots$ on both sides of this equality, we obtain

$$\mathbf{x}_w\left(x_1^k, x_2^k, x_3^k, \ldots\right) = x_{w_1}^k x_{w_2}^k \cdots x_{w_n}^k = \left(\underbrace{x_{w_1} x_{w_2} \cdots x_{w_n}}_{=\mathbf{x}_w}\right)^k = \mathbf{x}_w^k.$$

This proves Claim 6.]

Claim 7: Let k and m be positive integers. Then,

$$p_m\left(x_1^k, x_2^k, x_3^k, \ldots\right) = p_{km}$$

(where, of course, $p_m\left(x_1^k, x_2^k, x_3^k, \ldots\right)$ denotes the result of substituting $x_1^k, x_2^k, x_3^k, \ldots$ for $x_1, x_2, x_3, \ldots$ in the power series p_m).

[*Proof of Claim 7:* The definition of p_{km} yields $p_{km} = x_1^{km} + x_2^{km} + x_3^{km} + \cdots$.

On the other hand, the definition of p_m yields $p_m = x_1^m + x_2^m + x_3^m + \cdots = \sum_{i\geq 1} x_i^m$. Substituting $x_1^k, x_2^k, x_3^k, \ldots$ for $x_1, x_2, x_3, \ldots$ on both sides of this equality, we obtain

$$p_m\left(x_1^k, x_2^k, x_3^k, \ldots\right) = \sum_{i\geq 1} \underbrace{\left(x_i^k\right)^m}_{=x_i^{km}} = \sum_{i\geq 1} x_i^{km} = x_1^{km} + x_2^{km} + x_3^{km} + \cdots = p_{km}$$

(since $p_{km} = x_1^{km} + x_2^{km} + x_3^{km} + \cdots$). This proves Claim 7.]

Claim 8: Let k and d be positive integers. Then,

$$\mathbf{GR}_{(d)}\left(x_1^k, x_2^k, x_3^k, \ldots\right) = \sum_{\substack{w\in\mathfrak{L};\\ \ell(w)=d}} \mathbf{x}_w^k. \tag{13.192.52}$$

[*Proof of Claim 8:* Because of Claim 4, we have the following equality of summation signs:

$$\sum_{\substack{w\in\mathfrak{L};\\ \ell(w)=d}} = \sum_{\substack{w\in\mathfrak{A}^d;\\ w \text{ is Lyndon}}} . \tag{13.192.53}$$

But Proposition 6.6.36(a) (applied to $n = d$) yields

$$\mathbf{GR}_{(d)} = \underbrace{\sum_{\substack{w\in\mathfrak{A}^d;\\ w \text{ is Lyndon}}}}_{\substack{= \sum_{\substack{w\in\mathfrak{L};\\ \ell(w)=d}} \\ (\text{by } (13.192.53))}} \mathbf{x}_w = \sum_{\substack{w\in\mathfrak{L};\\ \ell(w)=d}} \mathbf{x}_w.$$

Substituting $x_1^k, x_2^k, x_3^k, \ldots$ for $x_1, x_2, x_3, \ldots$ on both sides of this equality, we obtain

$$\mathbf{GR}_{(d)}\left(x_1^k, x_2^k, x_3^k, \ldots\right) = \sum_{\substack{w\in\mathfrak{L};\\ \ell(w)=d}} \underbrace{\mathbf{x}_w\left(x_1^k, x_2^k, x_3^k, \ldots\right)}_{\substack{=\mathbf{x}_w^k \\ (\text{by Claim 6})}} = \sum_{\substack{w\in\mathfrak{L};\\ \ell(w)=d}} \mathbf{x}_w^k.$$

This proves Claim 8.]

For each positive integer n, we define a symmetric function $\widetilde{\mathbf{GR}}_n \in \Lambda$ by

$$\widetilde{\mathbf{GR}}_n = \frac{1}{n}\sum_{d\mid n} \mu(d)\, p_d^{n/d}.$$

Our goal will be to prove that $\mathbf{GR}_{(n)} = \widetilde{\mathbf{GR}}_n$ for each positive integer n.

The following two claims are key to our proof:

Claim 9: Every positive integer n satisfies

$$p_1^n = \sum_{d\mid n} d \cdot \mathbf{GR}_{(d)}\left(x_1^{n/d}, x_2^{n/d}, x_3^{n/d}, \ldots\right).$$

[*Proof of Claim 9:* It is well-known that

$$-\log\left(1-t\right)=\sum_{k\geq1}\frac{1}{k}t^{k} \tag{13.192.54}$$

in the ring $\mathbf{k}\left[\left[t\right]\right]$. (Indeed, this is the well-known Mercator series for the logarithm.)

Proposition 6.6.39 yields the equality

$$\frac{1}{1-p_1 t}=\prod_{w\in\mathfrak{L}}\frac{1}{1-\mathbf{x}_w t^{\ell(w)}}$$

in the power series ring $\left(\mathbf{k}\left[\left[\mathbf{x}\right]\right]\right)\left[\left[t\right]\right]$. Taking the logarithm of both sides of this identity, we obtain

$$\begin{aligned}
\log\frac{1}{1-p_1 t} &= \log\left(\prod_{w\in\mathfrak{L}}\frac{1}{1-\mathbf{x}_w t^{\ell(w)}}\right) = \underbrace{\sum_{w\in\mathfrak{L}}}_{\substack{=\sum_{d\geq1}\sum_{w\in\mathfrak{L};\ \ell(w)=d} \\ \text{(since each } w\in\mathfrak{L}\text{ satisfies } \ell(w)\in\{1,2,3,\ldots\} \\ \text{(by Claim 5))}}} \log\left(\frac{1}{1-\mathbf{x}_w t^{\ell(w)}}\right) \\
&= \sum_{d\geq1}\sum_{\substack{w\in\mathfrak{L};\\ \ell(w)=d}} \underbrace{\log\left(\frac{1}{1-\mathbf{x}_w t^{\ell(w)}}\right)}_{\substack{=\log\left(\dfrac{1}{1-\mathbf{x}_w t^{d}}\right) \\ \text{(since } \ell(w)=d\text{)}}} = \sum_{d\geq1}\sum_{\substack{w\in\mathfrak{L};\\ \ell(w)=d}} \underbrace{\log\left(\frac{1}{1-\mathbf{x}_w t^{d}}\right)}_{\substack{=-\log\left(1-\mathbf{x}_w t^d\right) \\ =\sum_{k\geq1}\dfrac{1}{k}\left(\mathbf{x}_w t^d\right)^k \\ \text{(by substituting } \mathbf{x}_w t^d \text{ for } t \\ \text{in (13.192.54))}}} \\
&= \sum_{d\geq1}\underbrace{\sum_{\substack{w\in\mathfrak{L};\\ \ell(w)=d}}\sum_{k\geq1}}_{=\sum_{k\geq1}\sum_{w\in\mathfrak{L};\ \ell(w)=d}} \frac{1}{k}\underbrace{\left(\mathbf{x}_w t^d\right)^k}_{=\mathbf{x}_w^k t^{kd}} = \sum_{d\geq1}\sum_{k\geq1}\sum_{\substack{w\in\mathfrak{L};\\ \ell(w)=d}}\frac{1}{k}\mathbf{x}_w^k t^{kd} = \sum_{d\geq1}\sum_{k\geq1}\frac{1}{k}\underbrace{\left(\sum_{\substack{w\in\mathfrak{L};\\ \ell(w)=d}}\mathbf{x}_w^k\right)}_{\substack{=\mathbf{GR}_{(d)}\left(x_1^k,x_2^k,x_3^k,\ldots\right) \\ \text{(by (13.192.52))}}} t^{kd} \\
&= \sum_{d\geq1}\underbrace{\sum_{k\geq1}\frac{1}{k}\mathbf{GR}_{(d)}\left(x_1^k,x_2^k,x_3^k,\ldots\right)t^{kd}}_{\substack{=\sum_{n\geq1;\ d\mid n}\dfrac{1}{n/d}\mathbf{GR}_{(d)}\left(x_1^{n/d},x_2^{n/d},x_3^{n/d},\ldots\right)t^{(n/d)d} \\ \text{(here, we have substituted } n/d \text{ for } k \text{ in the sum)}}} \\
&= \underbrace{\sum_{d\geq1}\sum_{\substack{n\geq1;\\ d\mid n}}}_{\substack{=\sum_{n\geq1}\sum_{d\mid n} \\ \text{(because the summation sign ``}\sum_{d\mid n}\text{''} \\ \text{ranges over all } \textbf{positive} \text{ divisors } d \text{ of } n\text{)}}} \frac{1}{n/d}\mathbf{GR}_{(d)}\left(x_1^{n/d},x_2^{n/d},x_3^{n/d},\ldots\right)\underbrace{t^{(n/d)d}}_{=t^n} \\
&= \sum_{n\geq1}\sum_{d\mid n}\frac{1}{n/d}\mathbf{GR}_{(d)}\left(x_1^{n/d},x_2^{n/d},x_3^{n/d},\ldots\right)t^n.
\end{aligned}$$

Comparing this with

$$\log \frac{1}{1-p_1 t} = -\log\left(1-p_1 t\right) = \sum_{k\geq 1} \frac{1}{k} \underbrace{\left(p_1 t\right)^k}_{=p_1^k t^k}$$

(this follows by substituting $p_1 t$ for t in (13.192.54))

$$= \sum_{k\geq 1} \frac{1}{k} p_1^k t^k = \sum_{n\geq 1} \frac{1}{n} p_1^n t^n,$$

we obtain

$$\sum_{n\geq 1} \frac{1}{n} p_1^n t^n = \sum_{n\geq 1} \sum_{d\mid n} \frac{1}{n/d} \mathbf{GR}_{(d)} \left(x_1^{n/d}, x_2^{n/d}, x_3^{n/d}, \ldots\right) t^n.$$

This is an equality between two formal power series in t. If we compare coefficients on both sides of this equality, then we obtain

$$\frac{1}{n} p_1^n = \sum_{d\mid n} \frac{1}{n/d} \mathbf{GR}_{(d)} \left(x_1^{n/d}, x_2^{n/d}, x_3^{n/d}, \ldots\right) \tag{13.192.55}$$

for each $n \in \{1,2,3,\ldots\}$.

Now, let n be a positive integer. Thus, $n \in \{1,2,3,\ldots\}$. Hence, the equality (13.192.55) holds. Multiplying both sides of this equality by n, we find

$$p_1^n = \sum_{d\mid n} \underbrace{n \cdot \frac{1}{n/d}}_{=d} \mathbf{GR}_{(d)} \left(x_1^{n/d}, x_2^{n/d}, x_3^{n/d}, \ldots\right) = \sum_{d\mid n} d \cdot \mathbf{GR}_{(d)} \left(x_1^{n/d}, x_2^{n/d}, x_3^{n/d}, \ldots\right).$$

This proves Claim 9.]

Claim 10: Every positive integer n satisfies

$$p_1^n = \sum_{d\mid n} d \cdot \widetilde{\mathbf{GR}}_d \left(x_1^{n/d}, x_2^{n/d}, x_3^{n/d}, \ldots\right).$$

[*Proof of Claim 10:* Let n be a positive integer.

Let f be a positive divisor of n. Thus, n/f is a positive integer. The definition of $\widetilde{\mathbf{GR}}_f$ yields

$$\widetilde{\mathbf{GR}}_f = \frac{1}{f} \sum_{d\mid f} \mu\left(d\right) p_d^{f/d}.$$

Substituting $x_1^{n/f}, x_2^{n/f}, x_3^{n/f}, \ldots$ for $x_1, x_2, x_3, \ldots$ on both sides of this equality, we obtain

$$\widetilde{\mathbf{GR}}_f \left(x_1^{n/f}, x_2^{n/f}, x_3^{n/f}, \ldots\right) = \frac{1}{f} \sum_{d\mid f} \mu\left(d\right) \left(\underbrace{p_d\left(x_1^{n/f}, x_2^{n/f}, x_3^{n/f}, \ldots\right)}_{\substack{=p_{(n/f)d} \\ \text{(by Claim 7, applied to } k=n/f \text{ and } m=d)}} \right)^{f/d}$$

$$= \frac{1}{f} \sum_{d\mid f} \mu\left(d\right) p_{(n/f)d}^{f/d}.$$

Multiplying both sides of this equality by f, we obtain

$$f \cdot \widetilde{\mathbf{GR}}_f \left(x_1^{n/f}, x_2^{n/f}, x_3^{n/f}, \ldots\right) = \sum_{d\mid f} \mu\left(d\right) p_{(n/f)d}^{f/d}. \tag{13.192.56}$$

Forget that we fixed f. We thus have proved the equality (13.192.56) for each positive divisor f of n.

Now,

$$\begin{aligned}
&\sum_{d\mid n} d\cdot\widetilde{\mathbf{GR}}_d\left(x_1^{n/d},x_2^{n/d},x_3^{n/d},\ldots\right)\\
&=\sum_{f\mid n}\underbrace{f\cdot\widetilde{\mathbf{GR}}_f\left(x_1^{n/f},x_2^{n/f},x_3^{n/f},\ldots\right)}_{\substack{=\sum_{d\mid f}\mu(d)p_{(n/f)d}^{f/d}\\ \text{(by (13.192.56))}}}\\
&\qquad\text{(here, we have renamed the summation index } d \text{ as } f\text{)}\\
&=\underbrace{\sum_{f\mid n}\sum_{d\mid f}}_{=\sum_{d\mid n}\sum_{\substack{f\mid n;\\ d\mid f}}}\mu\left(d\right)p_{(n/f)d}^{f/d}=\sum_{d\mid n}\sum_{\substack{f\mid n;\\ d\mid f}}\mu\left(d\right)p_{(n/f)d}^{f/d}. \qquad (13.192.57)
\end{aligned}$$

Now, fix a positive divisor d of n. Then, n/d is a positive integer. Hence, the map

$$\begin{aligned}
\{\text{positive divisors } g \text{ of } n/d\}&\to\{\text{positive divisors } f \text{ of } n \text{ satisfying } d\mid f\},\\
g&\mapsto dg
\end{aligned}$$

is a bijection[1223]. Thus, we can substitute dg for f in the sum $\sum_{\substack{f\mid n;\\ d\mid f}}\mu\left(d\right)p_{(n/f)d}^{f/d}$. We thus obtain

$$\sum_{\substack{f\mid n;\\ d\mid f}}\mu\left(d\right)p_{(n/f)d}^{f/d}=\sum_{g\mid n/d}\mu\left(d\right)\underbrace{p_{(n/(dg))d}^{dg/d}}_{=p_{n/g}^{g}}=\sum_{g\mid n/d}\mu\left(d\right)p_{n/g}^{g}. \qquad (13.192.58)$$

Forget that we fixed d. We thus have proved the equality (13.192.58) for each positive divisor d of n. Now, (13.192.57) becomes

$$\begin{aligned}
\sum_{d\mid n} d\cdot\widetilde{\mathbf{GR}}_d\left(x_1^{n/d},x_2^{n/d},x_3^{n/d},\ldots\right)&=\sum_{d\mid n}\underbrace{\sum_{\substack{f\mid n;\\ d\mid f}}\mu\left(d\right)p_{(n/f)d}^{f/d}}_{\substack{=\sum_{g\mid n/d}\mu(d)p_{n/g}^{g}\\ \text{(by (13.192.58))}}}\\
&=\sum_{d\mid n}\sum_{g\mid n/d}\mu\left(d\right)p_{n/g}^{g}. \qquad (13.192.59)
\end{aligned}$$

But if d and g are two positive integers, then the statement "$d\mid n$ and $g\mid n/d$" is equivalent to the statement "$g\mid n$ and $d\mid n/g$" [1224]. Hence, we have the following equality of summation signs:

$$\sum_{d\mid n}\sum_{g\mid n/d}=\sum_{g\mid n}\sum_{d\mid n/g}. \qquad (13.192.60)$$

[1223] Its inverse sends each e to e/d.

[1224] Indeed, it is easy to see that both of these statements are equivalent to "$dg\mid n$".

Thus, (13.192.59) becomes

$$\begin{aligned}
\sum_{d\mid n} d\cdot \widetilde{\mathbf{GR}}_d\left(x_1^{n/d},x_2^{n/d},x_3^{n/d},\ldots\right) &= \underbrace{\sum_{d\mid n}\sum_{g\mid n/d}}_{\substack{=\sum\limits_{g\mid n}\sum\limits_{d\mid n/g} \\ \text{(by (13.192.60))}}} \mu\left(d\right)p_{n/g}^{g} \\
&= \sum_{g\mid n} \underbrace{\sum_{d\mid n/g}\mu\left(d\right)}_{\substack{=\delta_{n/g,1} \\ \text{(by (13.84.3), applied} \\ \text{to } n/g \text{ instead of } n)}} p_{n/g}^{g} = \sum_{g\mid n}\delta_{n/g,1}p_{n/g}^{g} \\
&= \underbrace{\delta_{n/n,1}}_{\substack{=1 \\ \text{(since } n/n=1)}} \underbrace{p_{n/n}^{n}}_{=p_1^n} + \sum_{\substack{g\mid n;\\ g\neq n}} \underbrace{\delta_{n/g,1}}_{\substack{=0 \\ \text{(since } n/g\neq 1 \\ \text{(because } g\neq n))}} p_{n/g}^{g} \\
&\qquad \text{(here, we have split off the addend for } g=n \text{ from the sum)} \\
&= p_1^n + \underbrace{\sum_{\substack{g\mid n;\\ g\neq n}} 0p_{n/g}^{g}}_{=0} = p_1^n .
\end{aligned}$$

This proves Claim 10.]

Claim 11: We have $\mathbf{GR}_{(n)} = \widetilde{\mathbf{GR}}_n$ for each positive integer n.

[*Proof of Claim 11:* We shall prove Claim 11 by strong induction on n:

Induction step: Fix a positive integer m. Assume (as the induction hypothesis) that Claim 11 holds for all $n < m$. We must then show that Claim 11 holds for $n = m$.

As a consequence of our induction hypothesis, we can easily see that

$$\mathbf{GR}_{(d)} = \widetilde{\mathbf{GR}}_d \tag{13.192.61}$$

whenever d is a positive divisor of m satisfying $d \neq m$. [1225]

Now, Claim 9 (applied to $n = m$) yields

$$\begin{aligned}
p_1^m &= \sum_{d\mid m} d\cdot \mathbf{GR}_{(d)}\left(x_1^{m/d},x_2^{m/d},x_3^{m/d},\ldots\right) \\
&= m\cdot \underbrace{\mathbf{GR}_{(m)}\left(x_1^{m/m},x_2^{m/m},x_3^{m/m},\ldots\right)}_{\substack{=\mathbf{GR}_{(m)}(x_1,x_2,x_3,\ldots) \\ \text{(since } \left(x_1^{m/m},x_2^{m/m},x_3^{m/m},\ldots\right)=(x_1,x_2,x_3,\ldots) \\ \text{(because } x_i^{m/m}=x_i^1=x_i \text{ for each } i\in\{1,2,3,\ldots\}))}} + \sum_{\substack{d\mid m;\\ d\neq m}} d\cdot \underbrace{\mathbf{GR}_{(d)}}_{\substack{=\widetilde{\mathbf{GR}}_d \\ \text{(by (13.192.61))}}} \left(x_1^{m/d},x_2^{m/d},x_3^{m/d},\ldots\right) \\
&\qquad \left(\begin{array}{c}\text{here, we have split off the addend for } d=m \text{ from the sum} \\ \text{(since } m \text{ is a positive divisor of } m)\end{array}\right) \\
&= m\cdot \underbrace{\mathbf{GR}_{(m)}\left(x_1,x_2,x_3,\ldots\right)}_{\substack{=\mathbf{GR}_{(m)} \\ \text{(since } f(x_1,x_2,x_3,\ldots)=f \\ \text{for each } f\in\mathbf{k}[[\mathbf{x}]])}} + \sum_{\substack{d\mid m;\\ d\neq m}} d\cdot \widetilde{\mathbf{GR}}_d\left(x_1^{m/d},x_2^{m/d},x_3^{m/d},\ldots\right) \\
&= m\cdot \mathbf{GR}_{(m)} + \sum_{\substack{d\mid m;\\ d\neq m}} d\cdot \widetilde{\mathbf{GR}}_d\left(x_1^{m/d},x_2^{m/d},x_3^{m/d},\ldots\right).
\end{aligned}$$

[1225] *Proof of (13.192.61):* Let d be a positive divisor of m satisfying $d \neq m$. Then, $d \leq m$ (since d is a positive divisor of the positive integer m). Combining this with $d \neq m$, we obtain $d < m$.

But we have assumed (as the induction hypothesis) that Claim 11 holds for all $n < m$. Hence, Claim 11 holds for $n = d$ (since d is a positive integer satisfying $d < m$). In other words, we have $\mathbf{GR}_{(d)} = \widetilde{\mathbf{GR}}_d$. This proves (13.192.61).

Meanwhile, Claim 10 (applied to $n = m$) yields

$$\begin{aligned}
p_1^m &= \sum_{d \mid m} d \cdot \widetilde{\mathbf{GR}}_d \left(x_1^{m/d}, x_2^{m/d}, x_3^{m/d}, \ldots \right) \\
&= m \cdot \underbrace{\widetilde{\mathbf{GR}}_m \left(x_1^{m/m}, x_2^{m/m}, x_3^{m/m}, \ldots \right)}_{\substack{= \widetilde{\mathbf{GR}}_m (x_1, x_2, x_3, \ldots) \\ \text{(since } \left(x_1^{m/m}, x_2^{m/m}, x_3^{m/m}, \ldots \right) = (x_1, x_2, x_3, \ldots) \\ \text{(because } x_i^{m/m} = x_i^1 = x_i \text{ for each } i \in \{1,2,3,\ldots\}\text{))}}} + \sum_{\substack{d \mid m; \\ d \neq m}} d \cdot \widetilde{\mathbf{GR}}_d \left(x_1^{m/d}, x_2^{m/d}, x_3^{m/d}, \ldots \right) \\
&\qquad \left(\begin{array}{c} \text{here, we have split off the addend for } d = m \text{ from the sum} \\ \text{(since } m \text{ is a positive divisor of } m\text{)} \end{array} \right) \\
&= m \cdot \underbrace{\widetilde{\mathbf{GR}}_m (x_1, x_2, x_3, \ldots)}_{\substack{= \widetilde{\mathbf{GR}}_m \\ \text{(since } f(x_1, x_2, x_3, \ldots) = f \\ \text{for each } f \in \mathbf{k}[[\mathbf{x}]]\text{)}}} + \sum_{\substack{d \mid m; \\ d \neq m}} d \cdot \widetilde{\mathbf{GR}}_d \left(x_1^{m/d}, x_2^{m/d}, x_3^{m/d}, \ldots \right) \\
&= m \cdot \widetilde{\mathbf{GR}}_m + \sum_{\substack{d \mid m; \\ d \neq m}} d \cdot \widetilde{\mathbf{GR}}_d \left(x_1^{m/d}, x_2^{m/d}, x_3^{m/d}, \ldots \right).
\end{aligned}$$

Comparing these two equalities, we obtain

$$\begin{aligned}
& m \cdot \mathbf{GR}_{(m)} + \sum_{\substack{d \mid m; \\ d \neq m}} d \cdot \widetilde{\mathbf{GR}}_d \left(x_1^{m/d}, x_2^{m/d}, x_3^{m/d}, \ldots \right) \\
&= m \cdot \widetilde{\mathbf{GR}}_m + \sum_{\substack{d \mid m; \\ d \neq m}} d \cdot \widetilde{\mathbf{GR}}_d \left(x_1^{m/d}, x_2^{m/d}, x_3^{m/d}, \ldots \right).
\end{aligned}$$

Subtracting $\sum_{\substack{d \mid m; \\ d \neq m}} d \cdot \widetilde{\mathbf{GR}}_d \left(x_1^{m/d}, x_2^{m/d}, x_3^{m/d}, \ldots \right)$ from both sides of this equality, we find $m \cdot \mathbf{GR}_{(m)} = m \cdot \widetilde{\mathbf{GR}}_m$.

But m is a positive integer, and thus is invertible in $\mathbb{Q}$. Hence, m is invertible in $\mathbf{k}$ as well (since $\mathbf{k}$ is a $\mathbb{Q}$-algebra). Thus, we can divide both sides of the equality $m \cdot \mathbf{GR}_{(m)} = m \cdot \widetilde{\mathbf{GR}}_m$ by m. We thus obtain $\mathbf{GR}_{(m)} = \widetilde{\mathbf{GR}}_m$. In other words, Claim 11 holds for $n = m$. This completes the induction step. Hence, Claim 11 is proved by strong induction.]

Now, fix a positive integer n. Then, Claim 11 yields

$$\mathbf{GR}_{(n)} = \widetilde{\mathbf{GR}}_n = \frac{1}{n} \sum_{d \mid n} \mu(d) \, p_d^{n/d} \qquad \left(\text{by the definition of } \widetilde{\mathbf{GR}}_n \right).$$

This proves Proposition 6.6.36(b). □

We have now proved Proposition 6.6.39, Proposition 6.6.38, Proposition 6.6.43, Proposition 6.6.48, Proposition 6.6.49, Proposition 6.6.50, Proposition 6.6.40, Proposition 6.6.42, Proposition 6.6.37 and Proposition 6.6.36. In other words, we have proved all statements made in Subsection 6.6.2. This solves Exercise 6.6.51.

13.193. **Solution to Exercise 6.6.53.** *Solution to Exercise 6.6.53.* Let us first forget about Remark 6.6.52(b), and prove some basic lemmas. Our first lemma will be about roots of unity:

Lemma 13.193.1. *Let n be a positive integer. Let ω be a primitive n-th root of unity in $\mathbb{C}$ (for instance, $\exp(2\pi i/n)$). Then:*

(a) *If d is a positive divisor of n, then*

$$\sum_{\substack{i\in\{1,2,\ldots,n\};\\ d\mid i}} \omega^i = \delta_{n/d,1}.$$

(b) *If d is a positive divisor of n, then*

$$\sum_{\substack{i\in\{1,2,\ldots,n\};\\ \gcd(n,i)=d}} \omega^i = \mu\left(n/d\right).$$

Here, μ denotes the number-theoretical Möbius function (defined as in Exercise 2.9.6).

Proof of Lemma 13.193.1. We have required ω to be a primitive n-th root of unity in $\mathbb{C}$. Thus, $\omega^n = 1$, but if d is a positive integer satisfying $d < n$, then

$$\omega^d \neq 1. \tag{13.193.1}$$

(a) Let d be a positive divisor of n. Then, the elements $i \in \{1, 2, \ldots, n\}$ satisfying $d \mid i$ are precisely the n/d distinct elements $1d, 2d, \ldots, (n/d)\, d$. Hence,

$$\sum_{\substack{i\in\{1,2,\ldots,n\};\\ d\mid i}} \omega^i = \omega^{1d} + \omega^{2d} + \cdots + \omega^{(n/d)d} = \sum_{j=1}^{n/d} \underbrace{\omega^{jd}}_{=(\omega^d)^j} = \sum_{j=1}^{n/d} \left(\omega^d\right)^j. \tag{13.193.2}$$

Now, we are in one of the following two cases:

Case 1: We have $d = n$.

Case 2: We have $d \neq n$.

Let us first consider Case 1. In this case, we have $d = n$. Hence, $\omega^d = \omega^n = 1$ and $n/d = n/n = 1$. Thus, (13.193.2) becomes

$$\sum_{\substack{i\in\{1,2,\ldots,n\};\\ d\mid i}} \omega^i = \sum_{j=1}^{n/d} \left(\underbrace{\omega^d}_{=1}\right)^j = \sum_{j=1}^{n/d} \underbrace{1^j}_{=1} = \sum_{j=1}^{n/d} 1 = n/d = 1 = \delta_{n/d,1}.$$

(since $n/d = 1$ leads to $\delta_{n/d,1} = 1$). Hence, Lemma 13.193.1(a) is proved in Case 1.

Let us next consider Case 2. In this case, we have $d \neq n$. But d is a positive divisor of the positive integer n; hence, $d \leq n$. Combining this with $d \neq n$, we obtain $d < n$. Hence, (13.193.1) yields $\omega^d \neq 1$. Thus, $1 - \omega^d \neq 0$. Also, from $d \neq n$, we obtain $n/d \neq 1$.

But n/d is a positive integer (since d is a positive divisor of the positive integer n). Now,

$$\begin{aligned}
\sum_{\substack{i\in\{1,2,\ldots,n\};\\ d\mid i}} \omega^i &= \omega^{1d} + \omega^{2d} + \cdots + \omega^{(n/d)d} \\
&= \left(\omega^{1d} + \omega^{2d} + \cdots + \omega^{(n/d-1)d}\right) + \underbrace{\omega^{(n/d)d}}_{\substack{=\omega^n=1=\omega^{0d} \\ (\text{since } \omega^{0d}=\omega^0=1)}} \qquad (\text{since } n/d \text{ is a positive integer}) \\
&= \left(\omega^{1d} + \omega^{2d} + \cdots + \omega^{(n/d-1)d}\right) + \omega^{0d} \\
&= \omega^{0d} + \left(\omega^{1d} + \omega^{2d} + \cdots + \omega^{(n/d-1)d}\right) \\
&= \omega^{0d} + \omega^{1d} + \cdots + \omega^{(n/d-1)d} = \sum_{j=0}^{n/d-1} \underbrace{\omega^{jd}}_{=(\omega^d)^j} = \sum_{j=0}^{n/d-1} \left(\omega^d\right)^j.
\end{aligned}$$

Hence,

$$\sum_{j=0}^{n/d-1}\left(\omega^d\right)^j = \sum_{\substack{i\in\{1,2,\ldots,n\};\\ d\mid i}} \omega^i = \sum_{j=1}^{n/d} \underbrace{\left(\omega^d\right)^j}_{=\omega^d\left(\omega^d\right)^{j-1}} \qquad (\text{by } (13.193.2)) \tag{13.193.3}$$

$$= \omega^d \sum_{j=1}^{n/d}\left(\omega^d\right)^{j-1} = \omega^d \sum_{j=0}^{n/d-1}\left(\omega^d\right)^j \tag{13.193.4}$$

$$(\text{here, we have substituted } j \text{ for } j-1 \text{ in the sum}).$$

Hence,

$$\left(1-\omega^d\right)\sum_{j=0}^{n/d-1}\left(\omega^d\right)^j = \underbrace{\sum_{j=0}^{n/d-1}\left(\omega^d\right)^j}_{\substack{=\omega^d\sum_{j=0}^{n/d-1}\left(\omega^d\right)^j\\ (\text{by } (13.193.4))}} - \omega^d\sum_{j=0}^{n/d-1}\left(\omega^d\right)^j = \omega^d\sum_{j=0}^{n/d-1}\left(\omega^d\right)^j - \omega^d\sum_{j=0}^{n/d-1}\left(\omega^d\right)^j = 0.$$

We can divide both sides of this equality by $1-\omega^d$ (since $1-\omega^d \neq 0$), and thus obtain $\sum_{j=0}^{n/d-1}\left(\omega^d\right)^j = 0$. Comparing this with (13.193.3), we obtain $\sum_{j=1}^{n/d}\left(\omega^d\right)^j = 0$. Thus, (13.193.2) becomes

$$\sum_{\substack{i\in\{1,2,\ldots,n\};\\ d\mid i}} \omega^i = \sum_{j=1}^{n/d}\left(\omega^d\right)^j = 0 = \delta_{n/d,1} \qquad \left(\text{since } n/d \neq 1 \text{ leads to } \delta_{n/d,1} = 0\right).$$

Hence, Lemma 13.193.1(a) is proved in Case 2.

We have now proved Lemma 13.193.1(a) in both Cases 1 and 2. Thus, Lemma 13.193.1(a) always holds.

(b) For each positive integer m, we have[1226]

$$\sum_{d\mid m}\mu(d) = \delta_{m,1} \qquad (\text{by } (13.84.3), \text{ applied to } m \text{ instead of } n)$$

and thus

$$\delta_{m,1} = \sum_{d\mid m}\mu(d) = \sum_{f\mid m}\mu(f) \tag{13.193.5}$$

(here, we have renamed the summation index d as f).

Set

$$x_d = \sum_{\substack{i\in\{1,2,\ldots,n\};\\ \gcd(n,i)=d}} \omega^i \qquad \text{for each } d\in\mathbb{Z}. \tag{13.193.6}$$

We now claim that

$$x_d = \mu(n/d) \qquad \text{for each positive divisor } d \text{ of } n. \tag{13.193.7}$$

[*Proof of* (13.193.7)*:* If d is a positive divisor of n, then n/d is a positive integer (since n is a positive integer). Thus, we can prove (13.193.7) by strong induction on n/d. Let us do this:

Induction step: Fix a positive integer m. Assume (as the induction hypothesis) that (13.193.7) holds whenever $n/d < m$. We must prove that (13.193.7) holds whenever $n/d = m$.

If d is a positive divisor of n that satisfies $n/d < m$, then

$$x_d = \mu(n/e). \tag{13.193.8}$$

(Indeed, this is just a restatement of our induction hypothesis.)

Now, fix a positive divisor d of n that satisfies $n/d = m$. We shall prove that $x_d = \mu(n/d)$.

[1226] Here and in the following, the summation sign "$\sum_{d\mid m}$" will always be understood to range over all **positive** divisors d of m.

As a consequence of the induction hypothesis, we can easily see the following: If e is a positive divisor of n satisfying $d \mid e$ and $e \neq d$, then

$$x_e = \mu(n/e). \tag{13.193.9}$$

[*Proof of* (13.193.9)*:* Let e be a positive divisor of n satisfying $d \mid e$ and $e \neq d$. From $d \mid e$, we obtain $d \leq e$ (since d and e are positive integers). Combining this with $d \neq e$ (which follows from $e \neq d$), we obtain $d < e$. Since n is positive, this entails $n/e < n/d = m$. Hence, (13.193.8) (applied to e instead of d) yields $x_e = \mu(n/e)$. This proves (13.193.9).]

Recall that n is a positive integer, and d is a positive divisor of n. Hence, n/d is a positive integer, and we have $d \mid n$.

For any $i \in \{1, 2, \ldots, n\}$, we have the following chain of logical equivalences:

$$\begin{aligned}
&((\gcd(n,i) \text{ is a positive divisor of } n) \wedge (d \mid \gcd(n,i))) \\
\iff\ & (d \mid \gcd(n,i)) \qquad (\text{since ``}\gcd(n,i) \text{ is a positive divisor of } n\text{'' is always true}) \\
\iff\ & ((d \mid n) \wedge (d \mid i)) \\
& \left(\begin{array}{c}\text{because the logical equivalence } (x \mid \gcd(y,z)) \iff ((x \mid y) \wedge (x \mid z)) \\ \text{holds for any three integers } x,\ y \text{ and } z\end{array}\right) \\
\iff\ & (d \mid i) \qquad (\text{since ``}d \mid n\text{'' is always true}).
\end{aligned}$$

Hence, we have the following equality of summation signs:

$$\sum_{\substack{i\in\{1,2,\ldots,n\};\\ \gcd(n,i) \text{ is a positive divisor of } n;\\ d|\gcd(n,i)}} = \sum_{\substack{i\in\{1,2,\ldots,n\};\\ d|i}}. \tag{13.193.10}$$

We have[1227]

$$\begin{aligned}
\underbrace{\sum_{\substack{e|n;\\ d|e}}}_{=\sum_{\substack{e \text{ is a positive divisor of } n;\\ d|e}}} \underbrace{x_e}_{\substack{=\sum_{\substack{i\in\{1,2,\ldots,n\};\\ \gcd(n,i)=e}} \omega^i \\ (\text{by the definition of } x_e)}}
&= \underbrace{\sum_{\substack{e \text{ is a positive divisor of } n;\\ d|e}} \sum_{\substack{i\in\{1,2,\ldots,n\};\\ \gcd(n,i)=e}}}_{\substack{=\sum_{\substack{i\in\{1,2,\ldots,n\};\\ \gcd(n,i) \text{ is a positive divisor of } n;\\ d|\gcd(n,i)}} \\ =\sum_{\substack{i\in\{1,2,\ldots,n\};\\ d|i}} \\ (\text{by (13.193.10)})}} \omega^i \\
&= \sum_{\substack{i\in\{1,2,\ldots,n\};\\ d|i}} \omega^i = \delta_{n/d,1}
\end{aligned}$$

(by Lemma 13.193.1(a)). Hence,

$$\begin{aligned}
\delta_{n/d,1} &= \sum_{\substack{e|n;\\ d|e}} x_e = x_d + \sum_{\substack{e|n;\\ d|e;\\ e\neq d}} \underbrace{x_e}_{\substack{=\mu(n/e)\\ (\text{by (13.193.9)})}} \\
&\qquad (\text{here, we have split off the addend for } e = d \text{ from the sum}) \\
&= x_d + \sum_{\substack{e|n;\\ d|e;\\ e\neq d}} \mu(n/e). \qquad (13.193.11)
\end{aligned}$$

On the other hand, recall that n/d is a positive integer. Hence, (13.193.5) (applied to $m = n/d$) yields

$$\delta_{n/d,1} = \sum_{f|n/d} \mu(f). \tag{13.193.12}$$

[1227] Recall that the summation sign "$\sum_{\substack{e|n;\\ d|e}}$" stands for a sum over all **positive** divisors e of n satisfying $d \mid e$.

But it is straightforward to see that the map

$$\{\text{positive divisors } e \text{ of } n \text{ satisfying } d \mid e\} \to \{\text{positive divisors of } n/d\}, \qquad e \mapsto n/e$$

is well-defined and is a bijection[1228]. Thus, we can substitute n/e for f in the sum $\sum\limits_{f\mid n/d} \mu(f)$. We therefore obtain

$$\sum_{f\mid n/d} \mu(f) = \sum_{\substack{e\mid n;\\ d\mid e}} \mu(n/e).$$

Thus, (13.193.12) becomes

$$\delta_{n/d,1} = \sum_{f\mid n/d} \mu(f) = \sum_{\substack{e\mid n;\\ d\mid e}} \mu(n/e) = \mu(n/d) + \sum_{\substack{e\mid n;\\ d\mid e;\\ e\neq d}} \mu(n/e)$$

(here, we have split off the addend for $e = d$ from the sum). Comparing this with (13.193.11), we obtain

$$x_d + \sum_{\substack{e\mid n;\\ d\mid e;\\ e\neq d}} \mu(n/e) = \mu(n/d) + \sum_{\substack{e\mid n;\\ d\mid e;\\ e\neq d}} \mu(n/e).$$

Subtracting $\sum\limits_{\substack{e\mid n;\\ d\mid e;\\ e\neq d}} \mu(n/e)$ from both sides of this equality, we obtain $x_d = \mu(n/d)$. In other words, (13.193.7) holds.

Forget that we fixed d. We thus have proved that (13.193.7) holds whenever $n/d = m$. This completes the induction step. Thus, the induction proof of (13.193.7) is complete.]

Now, let d be a positive divisor of n. Then, the definition of x_d yields $x_d = \sum\limits_{\substack{i\in\{1,2,\ldots,n\};\\ \gcd(n,i)=d}} \omega^i$. Hence,

$$\sum_{\substack{i\in\{1,2,\ldots,n\};\\ \gcd(n,i)=d}} \omega^i = x_d = \mu(n/d) \qquad (\text{by } (13.193.7)).$$

This proves Lemma 13.193.1(b). □

Remark 13.193.2. Let n be a positive integer. If d is a positive divisor of n, then the complex numbers ω^i for all $i \in \{1, 2, \ldots, n\}$ satisfying $\gcd(n, i) = d$ are precisely the primitive (n/d)-th roots of unity in $\mathbb{C}$ (this is not hard to check). Thus, Lemma 13.193.1(b) states that the sum of all primitive (n/d)-th roots of unity in $\mathbb{C}$ is $\mu(n/d)$. Hence, Lemma 13.193.1(b) is an equivalent restatement of the following fact: For any positive integer m, the sum of all primitive m-th roots of unity in $\mathbb{C}$ is $\mu(m)$.

The next lemma we will need is an elementary fact from the theory of numbers, whose easy proof (e.g., using the Bezout theorem or the basic properties of greatest common divisors) we omit:

Lemma 13.193.3. *Let x, y and z be three integers such that $x \neq 0$. Let $d = \gcd(x, y)$. Then, we have the logical equivalence $(x \mid yz) \iff (x/d \mid z)$.*

The next lemma we will need is a mostly trivial property of permutations:

Lemma 13.193.4. *Let n be a positive integer. For every permutation $\sigma \in \mathfrak{S}_n$, we let $\operatorname{type}\sigma$ denote the cycle type of σ.*

Let $q \in \mathbb{Q}$ and $\sigma \in \mathfrak{S}_n$. Assume that every cycle of σ has size q. Then, q is a positive divisor of n, and we have $\operatorname{type}\sigma = \left(\underbrace{q, q, \ldots, q}_{n/q \text{ times}}\right)$.

[1228] Its inverse sends each $f \in \{\text{positive divisors of } n/d\}$ to n/f.

Proof of Lemma 13.193.4. Let k be the number of cycles of σ. Thus, σ has exactly k cycles, and each of these k cycles has size q (because we assumed that every cycle of σ has size q). But the cycles of σ are disjoint, and their union is the n-element set $\{1, 2, \ldots, n\}$. Hence, the sum of the sizes of all cycles of σ is n. Thus,

$$\begin{aligned} n &= (\text{the sum of the sizes of all cycles of } \sigma) = \underbrace{q + q + \cdots + q}_{k \text{ times}} \\ &\qquad (\text{since } \sigma \text{ has exactly } k \text{ cycles, and each of these } k \text{ cycles has size } q) \\ &= kq. \end{aligned}$$

Thus, $kq = n \neq 0$, so that $k \neq 0$ and $q \neq 0$. From $k \neq 0$, we conclude that σ has at least one cycle. The size of this cycle is q (since we assumed that every cycle of σ has size q); thus, q is the size of a cycle of σ, and therefore is a nonnegative integer. Combining this with $q \neq 0$, we conclude that q is a positive integer. Since $n = kq$, we conclude that $q \mid n$ (because $k \in \mathbb{N}$), so that q is a positive divisor of n. Furthermore, the definition of $\operatorname{type} \sigma$ shows that

$$\begin{aligned} \operatorname{type} \sigma &= (\text{the cycle type of } \sigma) = \Bigg(\underbrace{q, q, \ldots, q}_{k \text{ times}}\Bigg) \\ &\qquad (\text{since } \sigma \text{ has exactly } k \text{ cycles, and each of these } k \text{ cycles has size } q) \\ &= \Bigg(\underbrace{q, q, \ldots, q}_{n/q \text{ times}}\Bigg) \qquad (\text{since } k = n/q \text{ (because } n = kq)). \end{aligned}$$

This proves Lemma 13.193.4. □

Let us now step to the analysis of n-cycles in $\mathfrak{S}_n$:

Lemma 13.193.5. *Let n be a positive integer. For every permutation $\sigma \in \mathfrak{S}_n$, we let $\operatorname{type} \sigma$ denote the cycle type of σ.*

Let $z \in \mathfrak{S}_n$ be an n-cycle. Let $m \in \mathbb{Z}$. Let $d = \gcd(m, n)$. Then, $\operatorname{type}(z^m) = \Bigg(\underbrace{n/d, n/d, \ldots, n/d}_{d \text{ times}}\Bigg)$.

Proof of Lemma 13.193.5. Let us consider the cycles of the permutation $z^m \in \mathfrak{S}_n$. We shall show that every cycle of z^m has size n/d.

Indeed, let Z be a cycle of z^m (considered as a subset of $\{1, 2, \ldots, n\}$). Then, Z is a nonempty set; in other words, there exists some $x \in Z$. Consider this x.

Let $g = |Z|$. Then, g is a positive integer (since Z is nonempty), and the cycle Z has length g (since $g = |Z|$).

Now, Z is the cycle of z^m containing x (since Z is a cycle of z^m and since $x \in Z$). Thus, the cycle of z^m containing x has length g (since we know that the cycle Z has length g). Hence, the sequence $x, z^m(x), (z^m)^2(x), (z^m)^3(x), \ldots$ (obtained from x by applying z^m again and again) repeats every g elements, but not more frequently. Thus, for any $N \in \mathbb{N}$, we have the following equivalence of statements:

$$\left((z^m)^N(x) = x\right) \iff (g \mid N). \tag{13.193.13}$$

On the other hand, the permutation z is an n-cycle on an n-element set (namely, on $\{1, 2, \ldots, n\}$); thus, it has exactly one cycle, which has length n. The cycle of z which contains x must therefore be this unique cycle, and thus has length n. Hence, the sequence $x, z(x), z^2(x), z^3(x), \ldots$ (obtained from x by applying z again and again) repeats every n elements, but not more frequently. Thus, for any $N \in \mathbb{N}$, we have the following equivalence of statements:

$$\left(z^N(x) = x\right) \iff (n \mid N). \tag{13.193.14}$$

Note that $n \neq 0$. Hence, d is a positive integer (since $d = \gcd(m, n)$) and satisfies $d = \gcd(m, n) = \gcd(n, m) \mid n$. Hence, d is a positive divisor of n. Therefore, n/d is a positive integer (since n is also a positive integer), so that $n/d \in \mathbb{N}$.

Now, for any $N \in \mathbb{N}$, we have the following chain of logical equivalences:

$$\begin{aligned}(g \mid N) &\iff \left(\underbrace{(z^m)^N}_{=z^{mN}}(x) = x\right) && \text{(by (13.193.13))}\\ &\iff \left(z^{mN}(x) = x\right) \iff (n \mid mN) && \text{(by (13.193.14), applied to } mN \text{ instead of } N\text{)}\\ &\iff (n/d \mid N) \qquad (13.193.15)\end{aligned}$$

(by Lemma 13.193.3, applied to n, m and N instead of x, y and z).

Applying (13.193.15) to $N = n/d$, we obtain the equivalence $(g \mid n/d) \iff (n/d \mid n/d)$ (since $n/d \in \mathbb{N}$). Thus, we have $g \mid n/d$ (since we clearly have $n/d \mid n/d$). Hence, $g \leq n/d$ (since g and n/d are positive integers).

Applying (13.193.15) to $N = g$, we obtain the equivalence $(g \mid g) \iff (n/d \mid g)$ (since $g \in \mathbb{N}$). Thus, we have $n/d \mid g$ (since we clearly have $g \mid g$). Hence, $n/d \leq g$ (since n/d and g are positive integers).

Combining $g \leq n/d$ with $n/d \leq g$, we obtain $g = n/d$. Hence, $|Z| = g = n/d$. In other words, the set Z has size n/d.

Now, forget that we fixed Z. We thus have shown that if Z is a cycle of z^m (considered as a subset of $\{1, 2, \ldots, n\}$), then Z has size n/d. In other words, every cycle of z^m has size n/d.

Hence, Lemma 13.193.4 (applied to $q = n/d$ and $\sigma = z^m$) yields that n/d is a positive divisor of n, and that $\operatorname{type}(z^m) = \left(\underbrace{n/d, n/d, \ldots, n/d}_{n/(n/d) \text{ times}}\right)$. Hence,

$$\operatorname{type}(z^m) = \left(\underbrace{n/d, n/d, \ldots, n/d}_{n/(n/d) \text{ times}}\right) = \left(\underbrace{n/d, n/d, \ldots, n/d}_{d \text{ times}}\right) \qquad (\text{since } n/(n/d) = d).$$

This proves Lemma 13.193.5. □

At last, we can now solve Exercise 6.6.53 itself:

Let us use the notations from Remark 6.6.52(b). In particular, let n be a positive integer. We fix some n-cycle z in $\mathfrak{S}_n$, and we fix some generator g of the cyclic group C_n. We embed the cyclic group $C_n = \mathbb{Z}/n\mathbb{Z}$ as a subgroup in the symmetric group $\mathfrak{S}_n$ by identifying $g \in C_n$ with $z \in \mathfrak{S}_n$. (This is legitimate, since the n-cycle $z \in \mathfrak{S}_n$ is an element of order n.) Let ω be a primitive n-th root of unity in $\mathbb{C}$ (for instance, $\exp(2\pi i/n)$). Let $\gamma : C_n \to \mathbb{C}$ be the character of C_n that sends each $g^i \in C_n$ to ω^i.

We must prove the claim of Remark 6.6.52(b). In other words, we must prove that $\mathbf{GR}_{(n)} = \operatorname{ch}\left(\operatorname{Ind}_{C_n}^{\mathfrak{S}_n} \gamma\right)$.

In the following, μ denotes the number-theoretical Möbius function (defined as in Exercise 2.9.6), and the summation sign "$\sum_{d|n}$" will always be understood to range over all **positive** divisors d of n.

Extend the map $\operatorname{ch} : A = A(\mathfrak{S}) \to \Lambda$ to a $\mathbb{C}$-linear map $A_{\mathbb{C}} \to \Lambda_{\mathbb{C}}$. We shall call the latter map ch, too.

The cyclic group C_n is abelian; thus, every function from C_n to $\mathbb{C}$ is a class function of C_n (because any function from an abelian group to $\mathbb{C}$ is a class function). Hence, γ is a class function of C_n (since γ is a function from C_n to $\mathbb{C}$). In other words, $\gamma \in R_{\mathbb{C}}(C_n)$.

For every permutation $\sigma \in \mathfrak{S}_n$, we let $\operatorname{type}\sigma$ denote the cycle type of σ. Exercise 4.4.5(b) (applied to $H = C_n$ and $f = \gamma$) yields

$$\operatorname{ch}\left(\operatorname{Ind}_{C_n}^{\mathfrak{S}_n} \gamma\right) = \frac{1}{|C_n|} \sum_{h \in C_n} \gamma(h)\, p_{\operatorname{type} h} = \frac{1}{n} \sum_{h \in C_n} \gamma(h)\, p_{\operatorname{type} h} \qquad (13.193.16)$$

(since $|C_n| = n$).

If m and d are integers such that $\gcd(n,m) = d$, then

$$\begin{aligned}\operatorname{type}(g^m) &= \operatorname{type}(z^m) \qquad \text{(since } g = z \text{ (because we are identifying } g \text{ with } z\text{))} \\ &= \Bigg(\underbrace{n/d, n/d, \ldots, n/d}_{d \text{ times}}\Bigg) \\ &\qquad \text{(by Lemma 13.193.5 (since } d = \gcd(n,m) = \gcd(m,n)\text{))}\end{aligned}$$

and thus

$$\begin{aligned}p_{\operatorname{type}(g^m)} &= p_{\left(\underbrace{n/d, n/d, \ldots, n/d}_{d \text{ times}}\right)} = \underbrace{p_{n/d} p_{n/d} \cdots p_{n/d}}_{d \text{ times}} \\ &\qquad \left(\begin{array}{c}\text{by the definition of } p_\lambda \text{ for a partition } \lambda \\ \text{(since } \ell\left(\left(\underbrace{n/d, n/d, \ldots, n/d}_{d \text{ times}}\right)\right) = d\text{)}\end{array}\right) \\ &= p_{n/d}^d. \end{aligned} \tag{13.193.17}$$

But C_n is the cyclic group of size n, and g is a generator of C_n. Hence, the n elements of C_n are $g^1, g^2, \ldots, g^n$ (listed here without repetition). Hence,

$$\begin{aligned}\sum_{h \in C_n} \gamma(h) p_{\operatorname{type} h} &= \gamma(g^1) p_{\operatorname{type}(g^1)} + \gamma(g^2) p_{\operatorname{type}(g^2)} + \cdots + \gamma(g^n) p_{\operatorname{type}(g^n)} \\ &= \underbrace{\sum_{m \in \{1,2,\ldots,n\}}}_{\substack{= \sum_{d \mid n} \sum_{\substack{m \in \{1,2,\ldots,n\}; \\ \gcd(n,m) = d}} \\ \text{(here, we have split up the sum} \\ \text{according to the value of } \gcd(n,m)\text{,} \\ \text{because } \gcd(n,m) \text{ is a positive divisor of } n \\ \text{for each } m \in \{1,2,\ldots,n\}\text{)}}} \gamma(g^m) p_{\operatorname{type}(g^m)} \\ &= \sum_{d \mid n} \sum_{\substack{m \in \{1,2,\ldots,n\}; \\ \gcd(n,m) = d}} \underbrace{\gamma(g^m)}_{\substack{= \omega^m \\ \text{(by the definition of } \gamma\text{)}}} \underbrace{p_{\operatorname{type}(g^m)}}_{\substack{= p_{n/d}^d \\ \text{(by (13.193.17))}}} \\ &= \sum_{d \mid n} \underbrace{\sum_{\substack{m \in \{1,2,\ldots,n\}; \\ \gcd(n,m) = d}} \omega^m}_{\substack{= \sum_{\substack{i \in \{1,2,\ldots,n\}; \\ \gcd(n,i) = d}} \omega^i \\ \text{(here, we have renamed} \\ \text{the summation index } m \text{ as } i\text{)}}} p_{n/d}^d = \sum_{d \mid n} \underbrace{\sum_{\substack{i \in \{1,2,\ldots,n\}; \\ \gcd(n,i) = d}} \omega^i}_{\substack{= \mu(n/d) \\ \text{(by Lemma 13.193.1(b))}}} p_{n/d}^d \\ &= \sum_{d \mid n} \mu(n/d) p_{n/d}^d = \sum_{d \mid n} \mu\Bigg(\underbrace{n/(n/d)}_{= d}\Bigg) \underbrace{p_{n/(n/d)}^{n/d}}_{\substack{= p_d^{n/d} \\ \text{(since } n/(n/d) = d\text{)}}} \\ &\qquad \left(\begin{array}{c}\text{here, we have substituted } n/d \text{ for } d \text{ in the sum, since} \\ \text{the map } \{\text{positive divisors of } n\} \to \{\text{positive divisors of } n\}, \ d \mapsto n/d \\ \text{is a bijection}\end{array}\right) \\ &= \sum_{d \mid n} \mu(d) p_d^{n/d}.\end{aligned}$$

Hence, (13.193.16) becomes

$$\operatorname{ch}\left(\operatorname{Ind}_{C_n}^{\mathfrak{S}_n}\gamma\right)=\frac{1}{n}\underbrace{\sum_{h\in C_n}\gamma\left(h\right)p_{\operatorname{type}h}}_{=\sum_{d\mid n}\mu(d)p_d^{n/d}}=\frac{1}{n}\sum_{d\mid n}\mu\left(d\right)p_d^{n/d}.$$

But Proposition 6.6.36(b) yields

$$\mathbf{GR}_{(n)}=\frac{1}{n}\sum_{d\mid n}\mu\left(d\right)p_d^{n/d}.$$

Comparing these two equalities, we obtain $\mathbf{GR}_{(n)}=\operatorname{ch}\left(\operatorname{Ind}_{C_n}^{\mathfrak{S}_n}\gamma\right)$. This proves the claim of Remark 6.6.52(b). Thus, Exercise 6.6.53 is solved.

13.194. **Solution to Exercise 6.6.55.** *Solution to Exercise 6.6.55.* Before we prove Proposition 6.6.54, let us prove two simple lemmas:

Lemma 13.194.1. *Let $n\in\mathbb{N}$. Then:*

(a) *For any two compositions $\alpha,\beta\in\operatorname{Comp}_n$, we have the logical equivalence*

$$\left(\alpha=\beta\right)\iff\left(D\left(\alpha\right)=D\left(\beta\right)\right).$$

(b) *For any permutation $\sigma\in\mathfrak{S}_n$ and any composition $\beta\in\operatorname{Comp}_n$, we have the logical equivalence*

$$\left(\beta=\gamma\left(\sigma\right)\right)\iff\left(\operatorname{Des}\sigma=D\left(\beta\right)\right).$$

(c) *For any permutation $\sigma\in\mathfrak{S}_n$ and any composition $\beta\in\operatorname{Comp}_n$, we have the logical equivalence*

$$\left(\beta\text{ refines }\gamma\left(\sigma\right)\right)\iff\left(\operatorname{Des}\sigma\subset D\left(\beta\right)\right).$$

Proof of Lemma 13.194.1. If $\sigma\in\mathfrak{S}_n$ is any permutation, then $\gamma\left(\sigma\right)$ is a composition of n and satisfies

$$D\left(\gamma\left(\sigma\right)\right)=\operatorname{Des}\sigma \tag{13.194.1}$$

(since $\gamma\left(\sigma\right)$ was defined to be the unique composition α of n satisfying $D\left(\alpha\right)=\operatorname{Des}\sigma$).

(a) Set $[n-1]:=\{1,2,\ldots,n-1\}$. The map $\operatorname{Comp}_n\to 2^{[n-1]}$, $\alpha\mapsto D\left(\alpha\right)$ is a bijection. Thus, in particular, this map is injective. Hence, for any two compositions $\alpha,\beta\in\operatorname{Comp}_n$, we have the logical equivalence $\left(\alpha=\beta\right)\iff\left(D\left(\alpha\right)=D\left(\beta\right)\right)$. This proves Lemma 13.194.1(a).

(b) Let $\sigma\in\mathfrak{S}_n$ be a permutation. Let $\beta\in\operatorname{Comp}_n$ be a composition. Note that $\gamma\left(\sigma\right)\in\operatorname{Comp}_n$ (since $\sigma\in\mathfrak{S}_n$). Now, we have the following chain of logical equivalences:

$$\begin{aligned}\left(\beta=\gamma\left(\sigma\right)\right)\iff\left(\gamma\left(\sigma\right)=\beta\right)&\iff\left(D\left(\gamma\left(\sigma\right)\right)=D\left(\beta\right)\right)\\&\qquad\left(\text{by Lemma 13.194.1(a) (applied to }\alpha=\gamma\left(\sigma\right)\text{)}\right)\\&\iff\left(\operatorname{Des}\sigma=D\left(\beta\right)\right)\qquad\left(\text{by (13.194.1)}\right).\end{aligned}$$

This proves Lemma 13.194.1(b).

(c) For any two compositions $\alpha,\beta\in\operatorname{Comp}_n$, we have the logical equivalence

$$\left(\alpha\text{ refines }\beta\right)\iff\left(D\left(\alpha\right)\supset D\left(\beta\right)\right) \tag{13.194.2}$$

(by the definition of the relation "refines" in Definition 5.1.10).

Let $\sigma\in\mathfrak{S}_n$ be any permutation. Let $\beta\in\operatorname{Comp}_n$ be a composition. Note that $\gamma\left(\sigma\right)\in\operatorname{Comp}_n$ (since $\sigma\in\mathfrak{S}_n$). Now, we have the following chain of logical equivalences:

$$\begin{aligned}\left(\beta\text{ refines }\gamma\left(\sigma\right)\right)&\iff\left(D\left(\beta\right)\supset D\left(\gamma\left(\sigma\right)\right)\right)\\&\qquad\left(\begin{array}{c}\text{by (13.194.2) (applied to }\beta\text{ and }\gamma\left(\sigma\right)\text{ instead of }\alpha\text{ and }\beta\text{),}\\\text{since }\beta\in\operatorname{Comp}_n\text{ and }\gamma\left(\sigma\right)\in\operatorname{Comp}_n\end{array}\right)\\&\iff\left(D\left(\gamma\left(\sigma\right)\right)\subset D\left(\beta\right)\right)\iff\left(\operatorname{Des}\sigma\subset D\left(\beta\right)\right)\qquad\left(\text{by (13.194.1)}\right).\end{aligned}$$

This proves Lemma 13.194.1(c). □

Lemma 13.194.2. *Let $n \in \mathbb{N}$. Let $\beta = (\beta_1, \beta_2, \ldots, \beta_k) \in \operatorname{Comp}_n$. Let μ be the partition obtained by sorting the entries of β into decreasing order. Then,*

$$h_\mu = \sum_{\substack{\alpha \in \operatorname{Comp}_n; \\ \beta \text{ refines } \alpha}} s_{\operatorname{Rib}(\alpha)}.$$

Proof of Lemma 13.194.2. Consider the algebra homomorphism $\operatorname{NSym} \xrightarrow{\pi} \Lambda$ defined in Corollary 5.4.3.

It is easy to see that

$$\pi(H_\beta) = h_\mu. \tag{13.194.3}$$

[*Proof of (13.194.3):* The definition of μ shows that the nonzero entries of μ are precisely the entries of β (up to order). Since $\beta = (\beta_1, \beta_2, \ldots, \beta_k)$, we can restate this as follows: The nonzero entries of μ are precisely $\beta_1, \beta_2, \ldots, \beta_k$ (up to order). Hence, the definition of h_μ yields

$$h_\mu = h_{\beta_1} h_{\beta_2} \cdots h_{\beta_k}. \tag{13.194.4}$$

But $\beta_1, \beta_2, \ldots, \beta_k$ are positive integers (since $(\beta_1, \beta_2, \ldots, \beta_k) \in \operatorname{Comp}_n \subset \operatorname{Comp}$). Hence, the definition of π yields $\pi(H_{\beta_i}) = h_{\beta_i}$ for all $i \in \{1, 2, \ldots, k\}$. Multiplying these k equalities, we obtain $\pi(H_{\beta_1}) \pi(H_{\beta_2}) \cdots \pi(H_{\beta_k}) = h_{\beta_1} h_{\beta_2} \cdots h_{\beta_k}$.

Recall again that $\beta = (\beta_1, \beta_2, \ldots, \beta_k)$. Hence, (5.4.3) (applied to β and k instead of α and ℓ) yields $H_\beta = H_{\beta_1} H_{\beta_2} \cdots H_{\beta_k}$. Applying the map π to both sides of this equality, we find

$$\begin{aligned}\pi(H_\beta) &= \pi(H_{\beta_1} H_{\beta_2} \cdots H_{\beta_k}) = \pi(H_{\beta_1}) \pi(H_{\beta_2}) \cdots \pi(H_{\beta_k}) \qquad (\text{since } \pi \text{ is a } \mathbf{k}\text{-algebra homomorphism}) \\ &= h_{\beta_1} h_{\beta_2} \cdots h_{\beta_k}.\end{aligned}$$

Comparing this with (13.194.4), we find $\pi(H_\beta) = h_\mu$. Thus, (13.194.3) is proved.]

Theorem 5.4.10(b) shows that

$$\pi(R_\alpha) = s_{\operatorname{Rib}(\alpha)} \tag{13.194.5}$$

for each composition α.

The equality (5.4.9) (with the variables α and β renamed as β and α) says that

$$H_\beta = \underbrace{\sum_{\alpha \text{ coarsens } \beta}}_{\substack{= \sum_{\substack{\alpha \in \operatorname{Comp}_n; \\ \alpha \text{ coarsens } \beta}} = \sum_{\substack{\alpha \in \operatorname{Comp}_n; \\ \beta \text{ refines } \alpha}} \\ (\text{since the condition ``}\alpha \text{ coarsens } \beta\text{''} \\ \text{is equivalent to ``}\beta \text{ refines } \alpha\text{''})}} R_\alpha = \sum_{\substack{\alpha \in \operatorname{Comp}_n; \\ \beta \text{ refines } \alpha}} R_\alpha.$$

Applying the map π to both sides of this equality, we obtain

$$\begin{aligned}\pi(H_\beta) &= \pi\left(\sum_{\substack{\alpha \in \operatorname{Comp}_n; \\ \beta \text{ refines } \alpha}} R_\alpha\right) = \sum_{\substack{\alpha \in \operatorname{Comp}_n; \\ \beta \text{ refines } \alpha}} \underbrace{\pi(R_\alpha)}_{\substack{= s_{\operatorname{Rib}(\alpha)} \\ (\text{by } (13.194.5))}} \qquad (\text{since the map } \pi \text{ is } \mathbf{k}\text{-linear}) \\ &= \sum_{\substack{\alpha \in \operatorname{Comp}_n; \\ \beta \text{ refines } \alpha}} s_{\operatorname{Rib}(\alpha)}.\end{aligned}$$

Comparing this with (13.194.3), we obtain

$$h_\mu = \sum_{\substack{\alpha \in \operatorname{Comp}_n; \\ \beta \text{ refines } \alpha}} s_{\operatorname{Rib}(\alpha)}.$$

This proves Lemma 13.194.2. □

Proof of Proposition 6.6.54. Proposition 6.6.37 shows that the power series $\mathbf{GR}_\lambda$ belongs to Λ. In other words, $\mathbf{GR}_\lambda \in \Lambda$.

(b) For each permutation $\sigma \in \mathfrak{S}_n$, we have the logical equivalence

$$(\beta = \gamma(\sigma)) \iff (\operatorname{Des} \sigma = D(\beta))$$

(by Lemma 13.194.1(b)). Hence,

$$\begin{aligned}&\left(\text{the number of permutations } \sigma\in\mathfrak{S}_n \text{ satisfying } \operatorname{type}\sigma=\lambda \text{ and } \beta=\gamma\left(\sigma\right)\right)\\ &=\left(\text{the number of permutations } \sigma\in\mathfrak{S}_n \text{ satisfying } \operatorname{type}\sigma=\lambda \text{ and } \operatorname{Des}\sigma=D\left(\beta\right)\right).\end{aligned} \tag{13.194.6}$$

The definition of the noncommutative ribbon functions shows that the basis $\left(R_\alpha\right)_{\alpha\in\operatorname{Comp}}$ of NSym is dual to the basis $\left(L_\alpha\right)_{\alpha\in\operatorname{Comp}}$ of QSym (with respect to the dual pairing $\operatorname{NSym}\otimes\operatorname{QSym}\xrightarrow{(\cdot,\cdot)}\mathbf{k}$). In other words,

$$\left(R_\alpha,L_\zeta\right)=\delta_{\alpha,\zeta} \qquad \text{for all } \alpha,\zeta\in\operatorname{Comp}. \tag{13.194.7}$$

Now, consider the inclusion $\Lambda\overset{i}{\hookrightarrow}\operatorname{QSym}$ and the algebra homomorphism $\operatorname{NSym}\xrightarrow{\pi}\Lambda$ defined in Corollary 5.4.3. We have seen in Corollary 5.4.3 that these two maps i and π are adjoint (with respect to the dual pairing $\operatorname{NSym}\otimes\operatorname{QSym}\xrightarrow{(\cdot,\cdot)}\mathbf{k}$). In other words,

$$\left(f,i\left(g\right)\right)=\left(\pi\left(f\right),g\right) \qquad \text{for any } f\in\operatorname{NSym} \text{ and } g\in\Lambda. \tag{13.194.8}$$

Theorem 5.4.10(b) shows that $\pi\left(R_\alpha\right)=s_{\operatorname{Rib}(\alpha)}$ for every composition α. Applying this to $\alpha=\beta$, we find $\pi\left(R_\beta\right)=s_{\operatorname{Rib}(\beta)}$.

Recall that $\mathbf{GR}_\lambda\in\Lambda$. Thus, (13.194.8) (applied to $f=R_\beta$ and $g=\mathbf{GR}_\lambda$) yields

$$\left(R_\beta,i\left(\mathbf{GR}_\lambda\right)\right)=\left(\underbrace{\pi\left(R_\beta\right)}_{=s_{\operatorname{Rib}(\beta)}},\mathbf{GR}_\lambda\right)=\left(s_{\operatorname{Rib}(\beta)},\mathbf{GR}_\lambda\right)=\left(\mathbf{GR}_\lambda,s_{\operatorname{Rib}(\beta)}\right) \tag{13.194.9}$$

(since the Hall inner product is symmetric).

But i is just an inclusion map. Hence,

$$i\left(\mathbf{GR}_\lambda\right)=\mathbf{GR}_\lambda=\sum_{\substack{\sigma\in\mathfrak{S}_n;\\ \sigma \text{ has cycle type } \lambda}} L_{\gamma(\sigma)} \qquad \text{(by Proposition 6.6.40)}.$$

Now, (13.194.9) shows that

$$\left(\mathbf{GR}_\lambda, s_{\mathrm{Rib}(\beta)}\right) = \left(R_\beta, \underbrace{i\left(\mathbf{GR}_\lambda\right)}_{=\sum\limits_{\substack{\sigma\in\mathfrak{S}_n;\\ \sigma \text{ has cycle type } \lambda}} L_{\gamma(\sigma)}}\right) = \left(R_\beta, \sum_{\substack{\sigma\in\mathfrak{S}_n;\\ \sigma \text{ has cycle type } \lambda}} L_{\gamma(\sigma)}\right)$$

$$= \underbrace{\sum_{\substack{\sigma\in\mathfrak{S}_n;\\ \sigma \text{ has cycle type } \lambda}}}_{\substack{=\sum\limits_{\substack{\sigma\in\mathfrak{S}_n;\\ \operatorname{type}\sigma=\lambda}}\\ \text{(since } \operatorname{type}\sigma \text{ denotes the cycle type of } \sigma)}} \underbrace{\left(R_\beta, L_{\gamma(\sigma)}\right)}_{\substack{=\delta_{\beta,\gamma(\sigma)}\\ \text{(by (13.194.7),}\\ \text{applied to } \alpha=\beta\\ \text{and } \zeta=\gamma(\sigma))}}$$

$$\left(\text{since the dual pairing } \mathrm{NSym}\otimes\mathrm{QSym} \xrightarrow{(\cdot,\cdot)} \mathbf{k} \text{ is } \mathbf{k}\text{-bilinear}\right)$$

$$= \sum_{\substack{\sigma\in\mathfrak{S}_n;\\ \operatorname{type}\sigma=\lambda}} \delta_{\beta,\gamma(\sigma)} = \sum_{\substack{\sigma\in\mathfrak{S}_n;\\ \operatorname{type}\sigma=\lambda;\\ \beta=\gamma(\sigma)}} \underbrace{\delta_{\beta,\gamma(\sigma)}}_{\substack{=1\\ \text{(since } \beta=\gamma(\sigma))}} + \sum_{\substack{\sigma\in\mathfrak{S}_n;\\ \operatorname{type}\sigma=\lambda;\\ \beta\neq\gamma(\sigma)}} \underbrace{\delta_{\beta,\gamma(\sigma)}}_{\substack{=0\\ \text{(since } \beta\neq\gamma(\sigma))}}$$

$$\left(\begin{array}{c}\text{since every } \sigma\in\mathfrak{S}_n \text{ satisfies either } \beta=\gamma(\sigma) \text{ or } \beta\neq\gamma(\sigma)\\ \text{(but not both at the same time)}\end{array}\right)$$

$$= \sum_{\substack{\sigma\in\mathfrak{S}_n;\\ \operatorname{type}\sigma=\lambda;\\ \beta=\gamma(\sigma)}} 1 + \underbrace{\sum_{\substack{\sigma\in\mathfrak{S}_n;\\ \operatorname{type}\sigma=\lambda;\\ \beta\neq\gamma(\sigma)}} 0}_{=0} = \sum_{\substack{\sigma\in\mathfrak{S}_n;\\ \operatorname{type}\sigma=\lambda;\\ \beta=\gamma(\sigma)}} 1$$

$$= \left(\text{the number of permutations } \sigma\in\mathfrak{S}_n \text{ satisfying } \operatorname{type}\sigma=\lambda \text{ and } \beta=\gamma(\sigma)\right)\cdot 1$$

$$= \left(\text{the number of permutations } \sigma\in\mathfrak{S}_n \text{ satisfying } \operatorname{type}\sigma=\lambda \text{ and } \beta=\gamma(\sigma)\right).$$

Combining this with (13.194.6), we obtain

$$\begin{aligned}&\left(\text{the number of permutations } \sigma\in\mathfrak{S}_n \text{ satisfying } \operatorname{type}\sigma=\lambda \text{ and } \beta=\gamma(\sigma)\right)\\ &= \left(\text{the number of permutations } \sigma\in\mathfrak{S}_n \text{ satisfying } \operatorname{type}\sigma=\lambda \text{ and } \operatorname{Des}\sigma=D(\beta)\right)\\ &= \left(\mathbf{GR}_\lambda, s_{\mathrm{Rib}(\beta)}\right).\end{aligned}$$

This proves Proposition 6.6.54(b).

(a) For each permutation $\sigma\in\mathfrak{S}_n$, we have the logical equivalence

$$\left(\beta \text{ refines } \gamma(\sigma)\right) \iff \left(\operatorname{Des}\sigma\subset D(\beta)\right)$$

(by Lemma 13.194.1(c)). Hence,

$$\begin{aligned}&\left(\text{the number of permutations } \sigma\in\mathfrak{S}_n \text{ satisfying } \operatorname{type}\sigma=\lambda \text{ such that } \beta \text{ refines } \gamma(\sigma)\right)\\ &= \left(\text{the number of permutations } \sigma\in\mathfrak{S}_n \text{ satisfying } \operatorname{type}\sigma=\lambda \text{ and } \operatorname{Des}\sigma\subset D(\beta)\right).\end{aligned}\tag{13.194.10}$$

On the other hand, if $\alpha\in\mathrm{Comp}_n$ is a composition, then

$$\begin{aligned}&\left(\text{the number of permutations } \sigma\in\mathfrak{S}_n \text{ satisfying } \operatorname{type}\sigma=\lambda \text{ and } \gamma(\sigma)=\alpha\right)\\ &= \left(\mathbf{GR}_\lambda, s_{\mathrm{Rib}(\alpha)}\right).\end{aligned}\tag{13.194.11}$$

[*Proof of (13.194.11):* Let $\alpha\in\mathrm{Comp}_n$ be a composition. Write α in the form $\alpha=(\alpha_1,\alpha_2,\ldots,\alpha_\ell)$. Thus, $\alpha=(\alpha_1,\alpha_2,\ldots,\alpha_\ell)\in\mathrm{Comp}_n$. Hence, Proposition 6.6.54(b) (applied to α and ℓ instead of β and k) yields

$$\begin{aligned}&\left(\text{the number of permutations } \sigma\in\mathfrak{S}_n \text{ satisfying } \operatorname{type}\sigma=\lambda \text{ and } \alpha=\gamma(\sigma)\right)\\ &= \left(\text{the number of permutations } \sigma\in\mathfrak{S}_n \text{ satisfying } \operatorname{type}\sigma=\lambda \text{ and } \operatorname{Des}\sigma=D(\alpha)\right)\\ &= \left(\mathbf{GR}_\lambda, s_{\mathrm{Rib}(\alpha)}\right) \qquad \left(\text{this is the Hall inner product of } \mathbf{GR}_\lambda\in\Lambda \text{ and } s_{\mathrm{Rib}(\alpha)}\in\Lambda\right).\end{aligned}$$

But this immediately yields (13.194.11) (since the condition "$\gamma(\sigma) = \alpha$" is equivalent to "$\alpha = \gamma(\sigma)$").]

If $\sigma \in \mathfrak{S}_n$ is any permutation, then $\gamma(\sigma) \in \operatorname{Comp}_n$ (by the definition of $\gamma(\sigma)$). Hence,

$$\begin{aligned} &(\text{the number of permutations } \sigma \in \mathfrak{S}_n \text{ satisfying } \operatorname{type}\sigma = \lambda \text{ such that } \beta \text{ refines } \gamma(\sigma)) \\ &= \sum_{\substack{\alpha \in \operatorname{Comp}_n; \\ \beta \text{ refines } \alpha}} \underbrace{(\text{the number of permutations } \sigma \in \mathfrak{S}_n \text{ satisfying } \operatorname{type}\sigma = \lambda \text{ such that } \gamma(\sigma) = \alpha)}_{\substack{= \left(\mathbf{GR}_\lambda, s_{\operatorname{Rib}(\alpha)}\right) \\ (\text{by (13.194.11)})}} \\ &= \sum_{\substack{\alpha \in \operatorname{Comp}_n; \\ \beta \text{ refines } \alpha}} \left(\mathbf{GR}_\lambda, s_{\operatorname{Rib}(\alpha)}\right). \end{aligned}$$

Comparing this with

$$\left(\mathbf{GR}_\lambda, \underbrace{h_\mu}_{\substack{= \sum_{\substack{\alpha \in \operatorname{Comp}_n; \\ \beta \text{ refines } \alpha}} s_{\operatorname{Rib}(\alpha)} \\ (\text{by Lemma 13.194.2})}}\right) = \left(\mathbf{GR}_\lambda, \sum_{\substack{\alpha \in \operatorname{Comp}_n; \\ \beta \text{ refines } \alpha}} s_{\operatorname{Rib}(\alpha)}\right) = \sum_{\substack{\alpha \in \operatorname{Comp}_n; \\ \beta \text{ refines } \alpha}} \left(\mathbf{GR}_\lambda, s_{\operatorname{Rib}(\alpha)}\right)$$
$$(\text{since the Hall inner product is } \mathbf{k}\text{-bilinear}),$$

we obtain

$$\begin{aligned} &(\text{the number of permutations } \sigma \in \mathfrak{S}_n \text{ satisfying } \operatorname{type}\sigma = \lambda \text{ such that } \beta \text{ refines } \gamma(\sigma)) \\ &= (\mathbf{GR}_\lambda, h_\mu). \end{aligned} \tag{13.194.12}$$

Recall that $\mathbf{GR}_\lambda \in \Lambda$; also, μ is a weak composition (since μ is a partition). Furthermore, μ is a partition; thus, all the nonzero entries of μ are concentrated at the beginning of μ, and followed by an infinite string of zeroes. Hence, μ is the partition consisting of the nonzero entries of μ (sorted in decreasing order)[1229]. Therefore, Exercise 2.5.25 (applied to $\mathbf{GR}_\lambda$ and μ instead of f and β) yields

$$(\mathbf{GR}_\lambda, h_\mu) = (h_\mu, \mathbf{GR}_\lambda) = (\text{the coefficient of } \mathbf{x}^\mu \text{ in } \mathbf{GR}_\lambda). \tag{13.194.13}$$

Finally, let δ be the weak composition $(\beta_1, \beta_2, \ldots, \beta_k, 0, 0, 0, \ldots)$. Then, $\mathbf{x}^\delta = x_1^{\beta_1} x_2^{\beta_2} \cdots x_k^{\beta_k}$. Furthermore, the nonzero entries of δ are precisely the numbers $\beta_1, \beta_2, \ldots, \beta_k$ (since $(\beta_1, \beta_2, \ldots, \beta_k) \in \operatorname{Comp}$ shows that $\beta_1, \beta_2, \ldots, \beta_k$ are positive integers and thus nonzero). In other words, the nonzero entries of δ are precisely the entries of β (since $\beta = (\beta_1, \beta_2, \ldots, \beta_k)$). Hence, μ is the partition consisting of the nonzero entries of δ (sorted in decreasing order)[1230]. Therefore, Exercise 2.5.25 (applied to $\mathbf{GR}_\lambda$ and δ instead of f and δ) yields

$$(\mathbf{GR}_\lambda, h_\mu) = (h_\mu, \mathbf{GR}_\lambda) = \left(\text{the coefficient of } \mathbf{x}^\delta \text{ in } \mathbf{GR}_\lambda\right).$$

In view of $\mathbf{x}^\delta = x_1^{\beta_1} x_2^{\beta_2} \cdots x_k^{\beta_k}$, this rewrites as

$$(\mathbf{GR}_\lambda, h_\mu) = (h_\mu, \mathbf{GR}_\lambda) = \left(\text{the coefficient of } x_1^{\beta_1} x_2^{\beta_2} \cdots x_k^{\beta_k} \text{ in } \mathbf{GR}_\lambda\right).$$

Combining this equality with the equalities (13.194.10), (13.194.12) and (13.194.13), we obtain

$$\begin{aligned} &(\text{the number of permutations } \sigma \in \mathfrak{S}_n \text{ satisfying } \operatorname{type}\sigma = \lambda \text{ such that } \beta \text{ refines } \gamma(\sigma)) \\ &= (\text{the number of permutations } \sigma \in \mathfrak{S}_n \text{ satisfying } \operatorname{type}\sigma = \lambda \text{ and } \operatorname{Des}\sigma \subset D(\beta)) \\ &= \left(\text{the coefficient of } x_1^{\beta_1} x_2^{\beta_2} \cdots x_k^{\beta_k} \text{ in } \mathbf{GR}_\lambda\right) = (\text{the coefficient of } \mathbf{x}^\mu \text{ in } \mathbf{GR}_\lambda) \\ &= (\mathbf{GR}_\lambda, h_\mu) \qquad (\text{this is the Hall inner product of } \mathbf{GR}_\lambda \in \Lambda \text{ and } h_\mu \in \Lambda). \end{aligned}$$

This proves Proposition 6.6.54(a). □

[1229] Indeed, no sorting is required: The partition μ simply consists of the nonzero entries of μ.

[1230] Indeed, the definition of μ shows that μ is the partition consisting of the entries of β (sorted in decreasing order). But since the nonzero entries of δ are precisely the entries of β, we can rewrite this as follows: μ is the partition consisting of the nonzero entries of δ (sorted in decreasing order).

Thus, Proposition 6.6.54(a) is proved, so that Exercise 6.6.55 is solved.

13.195. **Solution to Exercise 7.1.9.** *Solution to Exercise 7.1.9.* Fix $m \in \{0, 1, 2, \ldots\}$. In order to check that $\zeta_Q^{\star m}(f) = \operatorname{ps}^1(f)(m)$, it is clearly enough to show that $\zeta_Q^{\star m}(M_\alpha) = \operatorname{ps}^1(M_\alpha)(m)$ for all compositions α. So let α be a composition. Iterated application of Proposition 5.1.7 yields

$$\Delta^{(m-1)} M_\alpha = \sum_{\substack{(\beta_1,\beta_2,\ldots,\beta_m):\\ \beta_1\beta_2\cdots\beta_m=\alpha}} M_{\beta_1} \otimes M_{\beta_2} \otimes \cdots \otimes M_{\beta_m}.$$

An addend on the right hand side of this equality is annihilated by the map $\zeta_Q^{\otimes m} : \operatorname{QSym}^{\otimes m} \to \mathbf{k}^{\otimes m} \cong \mathbf{k}$ unless each of the compositions $\beta_1, \beta_2, \ldots, \beta_m$ has length ≤ 1; all remaining terms are mapped to $1 \cdot 1 \cdots 1 = 1$. Hence,

$$\zeta_Q^{\otimes m}\left(\Delta^{(m-1)} M_\alpha\right) = \sum_{\substack{(\beta_1,\beta_2,\ldots,\beta_m):\\ \beta_1\beta_2\cdots\beta_m=\alpha;\\ \text{each of the compositions } \beta_1,\beta_2,\ldots,\beta_m \text{ has length } \leq 1}} 1 = \binom{m}{\ell},$$

where ℓ is the length of α. Hence,

$$\zeta_Q^{\star m}(M_\alpha) = \zeta_Q^{\otimes m}\left(\Delta^{(m-1)} M_\alpha\right) = \binom{m}{\ell} = \operatorname{ps}^1(M_\alpha)(m)$$

(by Proposition 7.1.7(i)). This completes the proof.

13.196. **Solution to Exercise 7.3.14.** *Solution to Exercise 7.3.14.*

Proof of Proposition 7.3.9. We recall the following fundamental fact (a version of inclusion-exclusion or a very simple special case of Möbius inversion): If R is a finite set, then

$$\sum_{T \subset R} (-1)^{|T|} = \delta_{R,\varnothing}. \tag{13.196.1}$$

[1231] We can use this to show a slightly more complicated fact: If P and R are two finite sets, then

$$\sum_{\substack{F \subset R;\\ F \supset P}} (-1)^{|F \setminus P|} = \delta_{P,R}. \tag{13.196.2}$$

[1231] For the sake of completeness, here is a short *proof of (13.196.1):* Let R be a finite set. We have

$$\sum_{T\subset R}(-1)^{|T|} = \sum_{k\in\mathbb{N}}\sum_{\substack{T\subset R;\\ |T|=k}} \underbrace{(-1)^{|T|}}_{\substack{=(-1)^k\\ (\text{since } |T|=k)}} = \sum_{k\in\mathbb{N}} \underbrace{\sum_{\substack{T\subset R;\\ |T|=k}}(-1)^k}_{=|\{T\subset R \ \mid\ |T|=k\}|(-1)^k} = \sum_{k\in\mathbb{N}} \underbrace{|\{T\subset R \ \mid\ |T|=k\}|}_{\substack{=(\text{the number of all } k\text{-element subsets of } R)\\ =\binom{|R|}{k}\\ (\text{by the combinatorial interpretation of}\\ \text{binomial coefficients})}} (-1)^k$$

$$= \sum_{k\in\mathbb{N}} \binom{|R|}{k} (-1)^k = \Big(\underbrace{1+(-1)}_{=0}\Big)^{|R|}$$

$$\left(\text{since } (1+(-1))^{|R|} = \sum_{k\in\mathbb{N}} \binom{|R|}{k} (-1)^k \text{ (by the binomial formula)}\right)$$

$$= 0^{|R|} = \delta_{|R|,0} = \delta_{R,\varnothing} \qquad (\text{since } |R| = 0 \text{ holds if and only if } R = \varnothing).$$

This proves (13.196.1).

[1232]

(a) Let $G=(V,E)$ be a finite graph. We have

$$\sum_{\substack{H=(V,E');\\ E'\cap E=\varnothing}} [H]^\sharp = \underbrace{\sum_{\substack{K=(V,F);\\ F\cap E=\varnothing}}}_{\substack{=\sum_{\substack{K=(V,F);\\ F\subset E^c}} \\ \text{(since } F\cap E=\varnothing \text{ is} \\ \text{equivalent to } F\subset E^c\text{)}}} \underbrace{[K]^\sharp}_{\substack{=\sum_{\substack{H=(V,E');\\ E'\supset F^c}} (-1)^{\left|E'\setminus F^c\right|}[H] \\ \text{(by the definition of } [K]^\sharp\text{)}}}$$

(here, we renamed H and E' as K and F in the sum)

$$= \underbrace{\sum_{\substack{K=(V,F);\\ F\subset E^c}} \sum_{\substack{H=(V,E');\\ E'\supset F^c}}}_{=\sum_{H=(V,E')} \sum_{\substack{K=(V,F);\\ F\subset E^c;\\ E'\supset F^c}}} \underbrace{(-1)^{\left|E'\setminus F^c\right|}}_{\substack{=(-1)^{\left|F\setminus (E')^c\right|} \\ \text{(since } E'\setminus F^c=E'\cup F=F\setminus \left(E'\right)^c\text{)}}} [H]$$

$$= \sum_{H=(V,E')} \underbrace{\sum_{\substack{K=(V,F);\\ F\subset E^c;\\ E'\supset F^c}}}_{\substack{=\sum_{\substack{F\subset E^c;\\ E'\supset F^c}} = \sum_{\substack{F\subset E^c;\\ F\supset \left(E'\right)^c}} \\ \text{(since } E'\supset F^c \text{ is equivalent to } F\supset \left(E'\right)^c\text{)}}} (-1)^{\left|F\setminus \left(E'\right)^c\right|} [H]$$

$$= \sum_{H=(V,E')} \underbrace{\sum_{\substack{F\subset E^c;\\ F\supset \left(E'\right)^c}} (-1)^{\left|F\setminus \left(E'\right)^c\right|}}_{\substack{=\delta_{(E')^c,E^c} \\ \text{(by (13.196.2), applied to} \\ R=E^c \text{ and } P=\left(E'\right)^c\text{)}}} [H]$$

$$= \sum_{H=(V,E')} \underbrace{\delta_{(E')^c,E^c}}_{\substack{=\delta_{E',E} \\ \text{(since } \left(E'\right)^c=E^c \text{ holds if} \\ \text{and only if } E'=E\text{)}}} [H] = \sum_{H=(V,E')} \delta_{E',E}\,[H] = [(V,E)] = [G]\,.$$

[1232] *Proof of (13.196.2):* Let P and R be two finite sets.

Let us first assume that $P\not\subset R$. Then, there exists no $F\subset R$ such that $F\supset P$ (because if such a F would exist, then we would have $P\subset F\subset R$, which would contradict $P\not\subset R$). Hence, the sum $\sum_{\substack{F\subset R;\\ F\supset P}} (-1)^{|F\setminus P|}$ is empty, and thus it simplifies to $\sum_{\substack{F\subset R;\\ F\supset P}} (-1)^{|F\setminus P|}=0$. On the other hand, $P\not\subset R$, so that $P\neq R$ and thus $\delta_{P,R}=0$. Hence, $\sum_{\substack{F\subset R;\\ F\supset P}} (-1)^{|F\setminus P|}=0=\delta_{P,R}$. Thus, (13.196.2) is proven under the assumption that $P\not\subset R$.

Now, let us forget that we have assumed $P\not\subset R$. We thus have shown that (13.196.2) holds if $P\not\subset R$. Hence, for the rest of this proof, we can WLOG assume that we don't have $P\not\subset R$. Assume this.

We have $P\subset R$ (since we don't have $P\not\subset R$). Hence, there exists a bijection from the set of all $F\subset R$ satisfying $F\supset P$ to the set of all $T\subset R\setminus P$; this bijection sends every F to $F\setminus P$. Hence, we can substitute T for $F\setminus P$ in the sum $\sum_{\substack{F\subset R;\\ F\supset P}} (-1)^{|F\setminus P|}$. We thus obtain

$$\sum_{\substack{F\subset R;\\ F\supset P}} (-1)^{|F\setminus P|} = \sum_{T\subset R\setminus P} (-1)^{|T|} = \delta_{R\setminus P,\varnothing} \qquad \text{(by (13.196.1), applied to } R\setminus P \text{ instead of } R\text{)}$$
$$= \delta_{P,R} \qquad \text{(since } R\setminus P=\varnothing \text{ if and only if } P=R \text{ (because } P\subset R\text{))}\,.$$

This proves (13.196.2).

This proves Proposition 7.3.9(a).

(b) For every finite graph $G = (V, E)$, we define the **complement** of this graph G to be the graph (V, E^c) (where E^c is defined as in Definition 7.3.8). We shall denote this complement by $\mathbf{c}(G)$.

The complement of the complement of a graph G is G again. In other words,

$$\mathbf{c}(\mathbf{c}(G)) = G \qquad \text{for every finite graph } G. \tag{13.196.3}$$

Recall that if G is a finite graph, then we denote the isomorphism class of this graph G by $[G]$. Let GrIs be the set of all isomorphism classes of finite graphs. For every $n \in \mathbb{N}$, let GrIs_n be the set of all isomorphism classes of finite graphs with n vertices. Thus, $\operatorname{GrIs} = \bigsqcup_{n\in\mathbb{N}} \operatorname{GrIs}_n$.

Fix $n \in \mathbb{N}$. The family $([G])_{[G]\in\operatorname{GrIs}_n}$ is a basis of the $\mathbf{k}$-module $\mathcal{G}_n$ (by the definition of the grading on $\mathcal{G}$). We are going to prove that the family $\left([G]^\sharp\right)_{[G]\in\operatorname{GrIs}_n}$ is a basis of the $\mathbf{k}$-module $\mathcal{G}_n$ as well.

We define a map $\mathbf{c}_n : \operatorname{GrIs}_n \to \operatorname{GrIs}_n$ by setting

$$\left(\mathbf{c}_n [G] = [\mathbf{c}(G)] \qquad \text{for every } [G] \in \operatorname{GrIs}_n\right).$$

[1233]

We have $\mathbf{c}_n \circ \mathbf{c}_n = \mathrm{id}$ [1234]. Hence, the maps $\mathbf{c}_n$ and $\mathbf{c}_n$ are mutually inverse. Thus, the map $\mathbf{c}_n$ is invertible, i.e., a bijection. Therefore, the family $\left([G]^\sharp\right)_{[G]\in\operatorname{GrIs}_n}$ is a reindexing of the family $\left((\mathbf{c}_n [G])^\sharp\right)_{[G]\in\operatorname{GrIs}_n}$.

If $G = (V, E)$ is a finite graph with n vertices, then

$$(\mathbf{c}_n [G])^\sharp = \sum_{\substack{H=(V,E');\\ E'\supset E}} (-1)^{\left|E'\setminus E\right|} [H] \tag{13.196.4}$$

[1235].

We define a map $e : \operatorname{GrIs}_n \to \mathbb{N}$ by setting

$$e[(V, E)] = |E| \qquad \text{for every } [(V, E)] \in \operatorname{GrIs}_n .$$

[1236] Thus, the map e sends the isomorphism class of a graph to the number of edges of this graph.

[1233] This map $\mathbf{c}_n$ is well-defined because of the following two simple observations:

- For each $[G] \in \operatorname{GrIs}_n$, we have $[\mathbf{c}(G)] \in \operatorname{GrIs}_n$ (because if the graph G has n vertices, then so does the graph $\mathbf{c}(G)$).
- For each graph G with n vertices, the isomorphism class $[\mathbf{c}(G)]$ depends only on the isomorphism class $[G]$, not on the graph G itself (i.e., if G_1 and G_2 are two isomorphic graphs with n vertices, then the graphs $\mathbf{c}(G_1)$ and $\mathbf{c}(G_2)$ are also isomorphic).

[1234] *Proof.* Let $U \in \operatorname{GrIs}_n$. Thus, U is an isomorphism class of a finite graph with n vertices (since GrIs_n is the set of all isomorphism classes of finite graphs with n vertices). In other words, there exists a graph G with n vertices such that $U = [G]$. Consider this G. Now, $\mathbf{c}_n \underbrace{U}_{=[G]} = \mathbf{c}_n [G] = [\mathbf{c}(G)]$ (by the definition of $\mathbf{c}_n$). Now,

$$\begin{aligned}(\mathbf{c}_n \circ \mathbf{c}_n) U &= \mathbf{c}_n \left(\underbrace{\mathbf{c}_n U}_{=[\mathbf{c}(G)]}\right) = \mathbf{c}_n [\mathbf{c}(G)] = \left[\underbrace{\mathbf{c}(\mathbf{c}(G))}_{\substack{=G\\ (\text{by } (13.196.3))}}\right] \qquad (\text{by the definition of } \mathbf{c}_n)\\ &= [G] = U = \mathrm{id}\, U.\end{aligned}$$

Now, forget that we fixed U. We thus have proven that $(\mathbf{c}_n \circ \mathbf{c}_n) U = \mathrm{id}\, U$ for every $U \in \operatorname{GrIs}_n$. In other words, $\mathbf{c}_n \circ \mathbf{c}_n = \mathrm{id}$. Qed.

[1235] *Proof of (13.196.4):* Let $G = (V, E)$ be a finite graph with n vertices. Then, $\mathbf{c}(G) = (V, E^c)$ (by the definition of $\mathbf{c}(G)$). Hence, the definition of $[\mathbf{c}(G)]^\sharp$ yields

$$[\mathbf{c}(G)]^\sharp = \sum_{\substack{H=(V,E');\\ E'\supset(E^c)^c}} (-1)^{\left|E'\setminus(E^c)^c\right|} [H] = \sum_{\substack{H=(V,E');\\ E'\supset E}} (-1)^{\left|E'\setminus E\right|} [H]$$

(since $(E^c)^c = E$). Now, the definition of $\mathbf{c}_n$ yields $\mathbf{c}_n [G] = [\mathbf{c}(G)]$, and therefore $(\mathbf{c}_n [G])^\sharp = [\mathbf{c}(G)]^\sharp = \sum_{\substack{H=(V,E');\\ E'\supset E}} (-1)^{\left|E'\setminus E\right|} [H]$. This proves (13.196.4).

[1236] This map is well-defined, because for any finite graph (V, E), the number $|E|$ depends only on the isomorphism class $[(V, E)]$ of (V, E) (and not on (V, E) itself).

We define a binary relation $\prec$ on the set GrIs_n as follows: For two elements $[H]$ and $[G]$ of GrIs_n, we set $[H] \prec [G]$ if and only if $e[H] > e[G]$. It is clear that this binary relation $\prec$ is transitive, asymmetric and irreflexive. Thus, there is a partial order on the set GrIs_n whose smaller relation is $\prec$. Consider GrIs_n as a poset, equipped with this partial order.

Now, every finite graph G with n vertices satisfies

$$(\mathbf{c}_n [G])^\sharp = [G] + (\text{a } \mathbf{k}\text{-linear combination of the elements } [H] \text{ for } [H] \in \operatorname{GrIs}_n \text{ satisfying } [H] \prec [G]) \tag{13.196.5}$$

[1237]. In other words, the family $\left((\mathbf{c}_n [G])^\sharp\right)_{[G]\in\operatorname{GrIs}_n}$ expands unitriangularly in the family $([G])_{[G]\in\operatorname{GrIs}_n}$ (by Remark 11.1.17(c), applied to $\mathcal{G}_n$, GrIs_n, $\left((\mathbf{c}_n [G])^\sharp\right)_{[G]\in\operatorname{GrIs}_n}$ and $([G])_{[G]\in\operatorname{GrIs}_n}$ instead of M, S, $(e_s)_{s\in S}$ and $(f_s)_{s\in S}$). Hence, the family $\left((\mathbf{c}_n [G])^\sharp\right)_{[G]\in\operatorname{GrIs}_n}$ is a basis of the $\mathbf{k}$-module $\mathcal{G}_n$ if and only if the family $([G])_{[G]\in\operatorname{GrIs}_n}$ is a basis of the $\mathbf{k}$-module $\mathcal{G}_n$ (by Corollary 11.1.19(e), applied to $\mathcal{G}_n$, GrIs_n, $\left((\mathbf{c}_n [G])^\sharp\right)_{[G]\in\operatorname{GrIs}_n}$ and $([G])_{[G]\in\operatorname{GrIs}_n}$ instead of M, S, $(e_s)_{s\in S}$ and $(f_s)_{s\in S}$). Thus, the family $\left((\mathbf{c}_n [G])^\sharp\right)_{[G]\in\operatorname{GrIs}_n}$ is a basis of the $\mathbf{k}$-module $\mathcal{G}_n$ (since the family $([G])_{[G]\in\operatorname{GrIs}_n}$ is a basis of the $\mathbf{k}$-module $\mathcal{G}_n$). Therefore, the family $\left([G]^\sharp\right)_{[G]\in\operatorname{GrIs}_n}$ also is a basis of the $\mathbf{k}$-module $\mathcal{G}_n$ (since the family $\left([G]^\sharp\right)_{[G]\in\operatorname{GrIs}_n}$ is a reindexing of the family $\left((\mathbf{c}_n [G])^\sharp\right)_{[G]\in\operatorname{GrIs}_n}$).

Now, forget that we fixed n. We thus have shown that, for every $n \in \mathbb{N}$, the family $\left([G]^\sharp\right)_{[G]\in\operatorname{GrIs}_n}$ is a basis of the $\mathbf{k}$-module $\mathcal{G}_n$. Therefore, the disjoint union of these families (over all $n \in \mathbb{N}$) is a basis of the

[1237] *Proof of (13.196.5):* Let G be a finite graph with n vertices. Write G as $G = (V, E)$.

Let $H = (V, E')$ be any graph satisfying $E' \supset E$ and $E' \neq E$. Clearly, the graph H has n vertices (since it has the same vertex set as G, and since G has n vertices). Thus, $[H] \in \operatorname{GrIs}_n$. Moreover, E is a proper subset of E' (since $E' \supset E$ and $E' \neq E$); hence, $|E| < |E'|$.

The definition of e yields $e[(V,E)] = |E|$ and $e[(V,E')] = |E'|$. Now, $e\left[\underbrace{G}_{=(V,E)}\right] = e[(V,E)] = |E| < |E'|$, so that $|E'| > e[G]$. But $e\left[\underbrace{H}_{=(V,E')}\right] = e[(V,E')] = |E'| > e[G]$. In other words, $[H] \prec [G]$ (by the definition of the relation $\prec$).

Now, forget that we fixed H. We thus have shown that if $H = (V, E')$ is any graph satisfying $E' \supset E$ and $E' \neq E$, then $[H] \in \operatorname{GrIs}_n$ and $[H] \prec [G]$. Hence,

$$\begin{aligned} &\sum_{\substack{H=(V,E');\\ E'\supset E \text{ and } E'\neq E}} (-1)^{|E'\setminus E|} [H] \\ &= (\text{a } \mathbf{k}\text{-linear combination of the elements } [H] \text{ for } [H] \in \operatorname{GrIs}_n \text{ satisfying } [H] \prec [G]) . \end{aligned} \tag{13.196.6}$$

But (13.196.4) becomes

$$\begin{aligned} &(\mathbf{c}_n [G])^\sharp \\ &= \sum_{\substack{H=(V,E');\\ E'\supset E}} (-1)^{|E'\setminus E|} [H] \\ &= \underbrace{(-1)^{|E\setminus E|}}_{\substack{=1\\ (\text{since } |E\setminus E| = |\varnothing| = 0)}} \left[\underbrace{(V,E)}_{=G}\right] + \underbrace{\sum_{\substack{H=(V,E');\\ E'\supset E \text{ and } E'\neq E}} (-1)^{|E'\setminus E|} [H]}_{\substack{=(\text{a } \mathbf{k}\text{-linear combination of the elements } [H] \text{ for } [H]\in\operatorname{GrIs}_n \text{ satisfying } [H]\prec[G])\\ (\text{by } (13.196.6))}} \\ &\qquad \left(\text{here, we have split off the addend for } E' = E \text{ and } H = (V,E) \text{ from the sum}\right) \\ &= [G] + (\text{a } \mathbf{k}\text{-linear combination of the elements } [H] \text{ for } [H] \in \operatorname{GrIs}_n \text{ satisfying } [H] \prec [G]) . \end{aligned}$$

This proves (13.196.5).

direct sum $\bigoplus_{n\in\mathbb{N}}\mathcal{G}_n$. Since the former disjoint union is the family $\left([G]^\sharp\right)_{[G]\in\mathrm{GrIs}}$, whereas the latter direct sum is $\bigoplus_{n\in\mathbb{N}}\mathcal{G}_n=\mathcal{G}$, this rewrites as follows: The family $\left([G]^\sharp\right)_{[G]\in\mathrm{GrIs}}$ is a basis of the $\mathbf{k}$-module $\mathcal{G}$. In other words, the elements $[G]^\sharp$, where $[G]$ ranges over all isomorphism classes of finite graphs, form a basis of the $\mathbf{k}$-module $\mathcal{G}$ (because GrIs is the set of all isomorphism classes of finite graphs). Proposition 7.3.9(b) is thus proven.

(c) We define a $\mathbf{k}$-linear map $\Delta':\mathcal{G}\to\mathcal{G}\otimes\mathcal{G}$ by

$$\Delta'[H]^\sharp=\sum_{\substack{(V_1,V_2);\\ V=V_1\sqcup V_2;\\ H=H|_{V_1}\sqcup H|_{V_2}}}[H\mid_{V_1}]^\sharp\otimes[H\mid_{V_2}]^\sharp .$$

[1238] In order to prove Proposition 7.3.9(c), it clearly suffices to show that $\Delta'=\Delta$.

Let $G=(V,E)$ be a finite graph. If T is a set of two-element subsets of V, and if R is a subset of V, then $T\mid_R$ shall denote the subset $\{X\in T\mid X\subset R\}$ of T. (Thus, if R is a subset of V, then $E\mid_R$ is the set of edges of the graph $G\mid_R$.)

[1238] This is well-defined, since the $[G]^\sharp$ form a basis of the $\mathbf{k}$-module $\mathcal{G}$.

Now, Proposition 7.3.9(a) yields $[G] = \sum_{\substack{H=(V,E');\\ E'\cap E=\varnothing}} [H]^\sharp$. Hence,

$$\begin{aligned}
\Delta'[G] &= \Delta' \sum_{\substack{H=(V,E');\\ E'\cap E=\varnothing}} [H]^\sharp = \sum_{\substack{H=(V,E');\\ E'\cap E=\varnothing}} \underbrace{\Delta'[H]^\sharp}_{= \sum_{\substack{(V_1,V_2);\\ V=V_1\sqcup V_2;\\ H=H|_{V_1}\sqcup H|_{V_2}}} [H|_{V_1}]^\sharp\otimes[H|_{V_2}]^\sharp} \\
&= \underbrace{\sum_{\substack{H=(V,E');\\ E'\cap E=\varnothing}} \sum_{\substack{(V_1,V_2);\\ V=V_1\sqcup V_2;\\ H=H|_{V_1}\sqcup H|_{V_2}}}}_{= \sum_{\substack{(V_1,V_2);\\ V=V_1\sqcup V_2}} \sum_{\substack{H=(V,E');\\ E'\cap E=\varnothing;\\ H=H|_{V_1}\sqcup H|_{V_2}}}} [H\mid_{V_1}]^\sharp \otimes [H\mid_{V_2}]^\sharp \\
&= \sum_{\substack{(V_1,V_2);\\ V=V_1\sqcup V_2}} \underbrace{\sum_{\substack{H=(V,E');\\ E'\cap E=\varnothing;\\ H=H|_{V_1}\sqcup H|_{V_2}}} [H\mid_{V_1}]^\sharp \otimes [H\mid_{V_2}]^\sharp}_{\substack{= \sum_{\substack{H_1=(V_1,E_1');\\ E_1'\cap(E|_{V_1})=\varnothing}} \sum_{\substack{H_2=(V_2,E_2');\\ E_2'\cap(E|_{V_2})=\varnothing}} \sum_{\substack{H=(V,E');\\ E'\cap E=\varnothing;\\ H=H|_{V_1}\sqcup H|_{V_2};\\ H|_{V_1}=H_1;\ H|_{V_2}=H_2}} [H|_{V_1}]^\sharp\otimes[H|_{V_2}]^\sharp \\ \text{(because for every } H=(V,E') \text{ satisfying } E'\cap E=\varnothing, \\ \text{we can write the subgraph } H|_{V_1} \text{ in the form } H_1=(V_1,E_1') \\ \text{with some } E_1' \text{ satisfying } E_1'\cap(E|_{V_1})=\varnothing, \text{ and we can} \\ \text{write the subgraph } H|_{V_2} \text{ in the form } H_2=(V_2,E_2') \\ \text{with some } E_2' \text{ satisfying } E_2'\cap(E|_{V_2})=\varnothing)}} \\
&= \underbrace{\sum_{\substack{(V_1,V_2);\\ V=V_1\sqcup V_2}}}_{= \sum_{\substack{(V_1,V_2);\\ V_1\sqcup V_2=V}}} \sum_{\substack{H_1=(V_1,E_1');\\ E_1'\cap(E|_{V_1})=\varnothing}} \sum_{\substack{H_2=(V_2,E_2');\\ E_2'\cap(E|_{V_2})=\varnothing}} \sum_{\substack{H=(V,E');\\ E'\cap E=\varnothing;\\ H=H|_{V_1}\sqcup H|_{V_2};\\ H|_{V_1}=H_1;\ H|_{V_2}=H_2}} \Bigg[\underbrace{H\mid_{V_1}}_{=H_1}\Bigg]^\sharp \otimes \Bigg[\underbrace{H\mid_{V_2}}_{=H_2}\Bigg]^\sharp \\
&= \sum_{\substack{(V_1,V_2);\\ V_1\sqcup V_2=V}} \sum_{\substack{H_1=(V_1,E_1');\\ E_1'\cap(E|_{V_1})=\varnothing}} \sum_{\substack{H_2=(V_2,E_2');\\ E_2'\cap(E|_{V_2})=\varnothing}} \underbrace{\sum_{\substack{H=(V,E');\\ E'\cap E=\varnothing;\\ H=H|_{V_1}\sqcup H|_{V_2};\\ H|_{V_1}=H_1;\ H|_{V_2}=H_2}} [H_1]^\sharp \otimes [H_2]^\sharp}_{\substack{=[H_1]^\sharp\otimes[H_2]^\sharp \\ \text{(because this sum has only one addend} \\ \text{(indeed, there exists only one } H=(V,E') \text{ satisfying} \\ E'\cap E=\varnothing,\ H=H|_{V_1}\sqcup H|_{V_2},\ H|_{V_1}=H_1 \text{ and } H|_{V_2}=H_2))}} \\
&= \sum_{\substack{(V_1,V_2);\\ V_1\sqcup V_2=V}} \sum_{\substack{H_1=(V_1,E_1');\\ E_1'\cap(E|_{V_1})=\varnothing}} \sum_{\substack{H_2=(V_2,E_2');\\ E_2'\cap(E|_{V_2})=\varnothing}} [H_1]^\sharp \otimes [H_2]^\sharp .
\end{aligned}$$

Comparing this with

$$\Delta [G] = \sum_{\substack{(V_1,V_2);\\ V_1 \sqcup V_2 = V}} \underbrace{[G \mid_{V_1}]}_{\substack{= \sum_{\substack{H_1 = (V_1, E_1');\\ E_1' \cap (E|_{V_1}) = \varnothing}} [H_1]^\sharp \\ \text{(by Proposition 7.3.9(a))}}} \otimes \underbrace{[G \mid_{V_2}]}_{\substack{= \sum_{\substack{H_2 = (V_2, E_2');\\ E_2' \cap (E|_{V_2}) = \varnothing}} [H_2]^\sharp \\ \text{(by Proposition 7.3.9(a))}}}$$

$$= \sum_{\substack{(V_1,V_2);\\ V_1 \sqcup V_2 = V}} \sum_{\substack{H_1 = (V_1, E_1');\\ E_1' \cap (E|_{V_1}) = \varnothing}} \sum_{\substack{H_2 = (V_2, E_2');\\ E_2' \cap (E|_{V_2}) = \varnothing}} [H_1]^\sharp \otimes [H_2]^\sharp ,$$

we obtain $\Delta' [G] = \Delta [G]$. Since this holds for every graph G, we thus obtain $\Delta' = \Delta$. As we know, this proves Proposition 7.3.9(c).

(d) We define a $\mathbf{k}$-bilinear operation $\sharp : \mathcal{G} \times \mathcal{G} \to \mathcal{G}$ (written infix[1239]) by

$$[H_1]^\sharp \sharp [H_2]^\sharp = \sum_{\substack{H = (V_1 \sqcup V_2, E);\\ H|_{V_1} = H_1;\\ H|_{V_2} = H_2}} [H]^\sharp .$$

[1240] In order to prove Proposition 7.3.9(d), it clearly suffices to show that this operation $\sharp$ is identical with the usual multiplication on $\mathcal{G}$.

Let G_1 and G_2 be any two finite graphs. We shall show that $[G_1] \sharp [G_2] = [G_1] [G_2]$.

[1239] This means that we write $a \sharp b$ to denote the image of a pair $(a, b) \in \mathcal{G} \times \mathcal{G}$ under this operation $\sharp$.

[1240] This is well-defined, since the $[G]^\sharp$ form a basis of the $\mathbf{k}$-module $\mathcal{G}$.

Indeed, write G_1 and G_2 in the forms $G_1 = (V_1, E_1)$ and $G_2 = (V_2, E_2)$. Then,

$$\underbrace{[G_1]}_{\substack{=\sum_{\substack{H_1=\left(V_1,E_1'\right);\\ E_1'\cap E_1=\varnothing}} [H_1]^\sharp \\ \text{(by Proposition 7.3.9(a))}}} \sharp \underbrace{[G_2]}_{\substack{=\sum_{\substack{H_2=\left(V_2,E_2'\right);\\ E_2'\cap E_2=\varnothing}} [H_2]^\sharp \\ \text{(by Proposition 7.3.9(a))}}}$$

$$= \left(\sum_{\substack{H_1=\left(V_1,E_1'\right);\\ E_1'\cap E_1=\varnothing}} [H_1]^\sharp \right) \sharp \left(\sum_{\substack{H_2=\left(V_2,E_2'\right);\\ E_2'\cap E_2=\varnothing}} [H_2]^\sharp \right) = \sum_{\substack{H_1=\left(V_1,E_1'\right);\\ E_1'\cap E_1=\varnothing}} \sum_{\substack{H_2=\left(V_2,E_2'\right);\\ E_2'\cap E_2=\varnothing}} \underbrace{[H_1]^\sharp \sharp [H_2]^\sharp}_{\substack{=\sum_{\substack{H=(V_1\sqcup V_2,E);\\ H\mid_{V_1}=H_1;\\ H\mid_{V_2}=H_2}} [H]^\sharp}}$$

$$= \underbrace{\sum_{\substack{H_1=\left(V_1,E_1'\right);\\ E_1'\cap E_1=\varnothing}} \sum_{\substack{H_2=\left(V_2,E_2'\right);\\ E_2'\cap E_2=\varnothing}} \sum_{\substack{H=(V_1\sqcup V_2,E);\\ H\mid_{V_1}=H_1;\\ H\mid_{V_2}=H_2}}}_{=\sum_{H_1=\left(V_1,E_1'\right)} \sum_{H_2=\left(V_2,E_2'\right)} \sum_{\substack{H=(V_1\sqcup V_2,E);\\ H\mid_{V_1}=H_1;\\ H\mid_{V_2}=H_2;\\ E_1'\cap E_1=\varnothing;\\ E_2'\cap E_2=\varnothing}}} [H]^\sharp$$

$$= \sum_{H_1=\left(V_1,E_1'\right)} \sum_{H_2=\left(V_2,E_2'\right)} \underbrace{\sum_{\substack{H=(V_1\sqcup V_2,E);\\ H\mid_{V_1}=H_1;\\ H\mid_{V_2}=H_2;\\ E_1'\cap E_1=\varnothing;\\ E_2'\cap E_2=\varnothing}}}_{\substack{=\sum_{\substack{H=(V_1\sqcup V_2,E);\\ H\mid_{V_1}=H_1;\\ H\mid_{V_2}=H_2;\\ \left(E\mid_{V_1}\right)\cap E_1=\varnothing;\\ \left(E\mid_{V_2}\right)\cap E_2=\varnothing}} \\ \text{(because for a graph } H=(V_1\sqcup V_2,E) \\ \text{satisfying } H\mid_{V_1}=H_1 \text{ and } H\mid_{V_2}=H_2, \\ \text{we have } E_1'=E\mid_{V_1} \text{ and } E_2'=E\mid_{V_2}\text{)}}} [H]^\sharp$$

$$= \underbrace{\sum_{H_1=\left(V_1,E_1'\right)} \sum_{H_2=\left(V_2,E_2'\right)} \sum_{\substack{H=(V_1\sqcup V_2,E);\\ H\mid_{V_1}=H_1;\\ H\mid_{V_2}=H_2;\\ \left(E\mid_{V_1}\right)\cap E_1=\varnothing;\\ \left(E\mid_{V_2}\right)\cap E_2=\varnothing}}}_{\substack{=\sum_{\substack{H=(V_1\sqcup V_2,E);\\ \left(E\mid_{V_1}\right)\cap E_1=\varnothing;\\ \left(E\mid_{V_2}\right)\cap E_2=\varnothing}} = \sum_{\substack{H=(V_1\sqcup V_2,E);\\ E\cap(E_1\sqcup E_2)=\varnothing}} \\ \text{(since the statement } \left(\left(E\mid_{V_1}\right)\cap E_1=\varnothing \text{ and } \left(E\mid_{V_2}\right)\cap E_2=\varnothing\right) \\ \text{is equivalent to } E\cap(E_1\sqcup E_2)=\varnothing\text{)}}} [H]^\sharp$$

$$= \sum_{\substack{H=(V_1\sqcup V_2,E);\\ E\cap(E_1\sqcup E_2)=\varnothing}} [H]^\sharp .$$

Compared with

$$\begin{aligned}[G_1][G_2] &= [G_1 \sqcup G_2] = [(V_1 \sqcup V_2, E_1 \sqcup E_2)] \\ &= \sum_{\substack{H=(V_1 \sqcup V_2, E);\\ E \cap (E_1 \sqcup E_2) = \varnothing}} [H]^\sharp \qquad \text{(by Proposition 7.3.9(a))},\end{aligned}$$

this yields $[G_1] \sharp [G_2] = [G_1][G_2]$.

We now forget that we fixed G_1 and G_2. We have thus shown that $[G_1] \sharp [G_2] = [G_1][G_2]$ for any two finite graphs G_1 and G_2. Thus, the operation $\sharp$ is identical with the usual multiplication on $\mathcal{G}$. This completes the proof of Proposition 7.3.9(d). □

Proof of Proposition 7.3.11. Proposition 7.3.9(a) shows that every finite graph $G = (V, E)$ satisfies

$$[G] = \sum_{\substack{H=(V,E');\\ E' \cap E = \varnothing}} [H]^\sharp = \sum_{\substack{K=(V,E');\\ E' \cap E = \varnothing}} [K]^\sharp \tag{13.196.7}$$

(here, we renamed the summation index H as K). Let us now show that

$$([G], [H]) = ([H], [G]) \tag{13.196.8}$$

for any two finite graphs G and H.

Proof of (13.196.8): We shall use the following notation: If V and W are two sets, and if $\varphi : V \to W$ is a map, then φ_* will denote the map from the powerset of V to the powerset of W which sends every $T \subset V$ to $\varphi(T) \subset W$. This map φ_* is a bijection if φ is a bijection.

Let G and H be two finite graphs. Let us write G and H in the forms $G = (V, E)$ and $H = (W, F)$. Now,

$$\begin{aligned}\left(\underbrace{[G]}_{\substack{= \sum\limits_{\substack{K=(V,E');\\ E' \cap E = \varnothing}} [K]^\sharp \\ \text{(by (13.196.7))}}}, [H] \right) &= \left(\sum_{\substack{K=(V,E');\\ E' \cap E = \varnothing}} [K]^\sharp, [H] \right) = \sum_{\substack{K=(V,E');\\ E' \cap E = \varnothing}} \underbrace{\left([K]^\sharp, [H]\right)}_{\substack{=|\operatorname{Iso}(K,H)| \\ \text{(by the definition of} \\ \text{the form } (\cdot,\cdot))}} \\ &\qquad \text{(since the form } (\cdot,\cdot) \text{ is } \mathbf{k}\text{-bilinear)} \\ &= \sum_{\substack{K=(V,E');\\ E' \cap E = \varnothing}} |\operatorname{Iso}(K, H)|. \end{aligned} \tag{13.196.9}$$

However, for every graph $K = (V, E')$, we have

$$\begin{aligned}\operatorname{Iso}(K, H) &= (\text{the set of all isomorphisms from } K \text{ to } H) \\ &= \{\varphi : V \to W \mid \varphi \text{ is a bijection and satisfies } \varphi_*(E') = F\}\end{aligned}$$

(because the isomorphisms from K to H are defined to be the bijections $\varphi : V \to W$ such that $\varphi_* (E') = F$). Hence,

$$
\begin{aligned}
&\sum_{\substack{K=(V,E');\\ E'\cap E=\varnothing}} \left| \underbrace{\operatorname{Iso}(K,H)}_{=\{\varphi : V\to W \ \mid\ \varphi \text{ is a bijection and satisfies } \varphi_*(E')=F\}} \right| \\
&= \underbrace{\sum_{\substack{K=(V,E');\\ E'\cap E=\varnothing}}}_{\substack{=\sum\limits_{\substack{E' \text{ is a set of}\\ \text{two-element subsets of } V;\\ E'\cap E=\varnothing}}}} \left| \left\{ \varphi : V \to W \ \mid\ \varphi \text{ is a bijection and satisfies } \underbrace{\varphi_*(E') = F}_{\substack{\text{this is equivalent to}\\ E'=(\varphi_*)^{-1}(F)\\ \text{(since } \varphi_* \text{ is a bijection}\\ \text{(since } \varphi \text{ is a bijection))}}} \right\} \right| \\
&= \sum_{\substack{E' \text{ is a set of}\\ \text{two-element subsets of } V;\\ E'\cap E=\varnothing}} \left| \left\{ \varphi : V \to W \ \mid\ \varphi \text{ is a bijection and satisfies } E' = (\varphi_*)^{-1}(F) \right\} \right| \\
&= \left| \left\{ \varphi : V \to W \ \mid\ \varphi \text{ is a bijection and satisfies } (\varphi_*)^{-1}(F) \cap E = \varnothing \right\} \right| .
\end{aligned}
$$

Now, (13.196.9) becomes

$$
\begin{aligned}
([G],[H]) &= \sum_{\substack{K=(V,E');\\ E'\cap E=\varnothing}} \left|\operatorname{Iso}(K,H)\right| \\
&= \left| \left\{ \varphi : V \to W \ \mid\ \varphi \text{ is a bijection and satisfies } (\varphi_*)^{-1}(F) \cap E = \varnothing \right\} \right| . \qquad (13.196.10)
\end{aligned}
$$

The same argument (applied to H, W, F, G, V and E instead of G, V, E, H, W and F) yields

$$
([H],[G]) = \left| \left\{ \varphi : W \to V \ \mid\ \varphi \text{ is a bijection and satisfies } (\varphi_*)^{-1}(E) \cap F = \varnothing \right\} \right| . \tag{13.196.11}
$$

Now, we define two sets $\mathfrak{P}$ and $\mathfrak{Q}$ by

$$
\mathfrak{P} = \left\{ \varphi : V \to W \ \mid\ \varphi \text{ is a bijection and satisfies } (\varphi_*)^{-1}(F) \cap E = \varnothing \right\}
$$

and

$$
\mathfrak{Q} = \left\{ \varphi : W \to V \ \mid\ \varphi \text{ is a bijection and satisfies } (\varphi_*)^{-1}(E) \cap F = \varnothing \right\} .
$$

Then, (13.196.10) becomes

$$
([G],[H]) = \left| \underbrace{\left\{ \varphi : V \to W \ \mid\ \varphi \text{ is a bijection and satisfies } (\varphi_*)^{-1}(F) \cap E = \varnothing \right\}}_{=\mathfrak{P}} \right| = |\mathfrak{P}| . \tag{13.196.12}
$$

Also, (13.196.11) becomes

$$
([H],[G]) = \left| \underbrace{\left\{ \varphi : W \to V \ \mid\ \varphi \text{ is a bijection and satisfies } (\varphi_*)^{-1}(E) \cap F = \varnothing \right\}}_{=\mathfrak{Q}} \right| = |\mathfrak{Q}| . \tag{13.196.13}
$$

But every $\psi \in \mathfrak{P}$ satisfies $\psi^{-1} \in \mathfrak{Q}$ [1241]. Hence, we can define a map

$$\begin{aligned} \mathbf{A} : \mathfrak{P} &\to \mathfrak{Q}, \\ \psi &\mapsto \psi^{-1}. \end{aligned}$$

Similarly, we can define a map

$$\begin{aligned} \mathbf{B} : \mathfrak{Q} &\to \mathfrak{P}, \\ \psi &\mapsto \psi^{-1}. \end{aligned}$$

Consider these two maps $\mathbf{A}$ and $\mathbf{B}$. Clearly, these maps $\mathbf{A}$ and $\mathbf{B}$ are mutually inverse[1242]. Hence, $\mathbf{A}$ is a bijection. Thus, there exists a bijection $\mathfrak{P} \to \mathfrak{Q}$ (namely, $\mathbf{A}$). Consequently, $|\mathfrak{P}| = |\mathfrak{Q}|$. Now, (13.196.12) becomes $([G], [H]) = |\mathfrak{P}| = |\mathfrak{Q}| = ([H], [G])$ (by (13.196.13)). This proves (13.196.8).

Now, let a and b be two elements of $\mathcal{G}$. We want to show that $(a, b) = (b, a)$. This equality is $\mathbf{k}$-linear in each of a and b. Therefore, we can WLOG assume that a and b belong to the family $([G])_{[G] \text{ is an isomorphism class of finite graphs}}$ (because this family is a basis of the $\mathbf{k}$-module $\mathcal{G}$). Assume this. Then, $a = [G]$ and $b = [H]$ for two finite graphs G and H. Consider these G and H. Now,

$$\begin{aligned} \Big(\underbrace{a}_{=[G]}, \underbrace{b}_{=[H]}\Big) = ([G], [H]) &= \Big(\underbrace{[H]}_{=b}, \underbrace{[G]}_{=a}\Big) \qquad \text{(by (13.196.8))} \\ &= (b, a). \end{aligned}$$

We thus have shown $(a, b) = (b, a)$.

Let us now forget that we fixed a and b. We thus have proven that $(a, b) = (b, a)$ for any $a \in \mathcal{G}$ and $b \in \mathcal{G}$. In other words, the form $(\cdot, \cdot) : \mathcal{G} \times \mathcal{G} \to \mathbf{k}$ is symmetric. This proves Proposition 7.3.11. □

[1241] *Proof.* Let $\psi \in \mathfrak{P}$. Then, $\psi \in \mathfrak{P} = \left\{ \varphi : V \to W \ \mid \ \varphi \text{ is a bijection and satisfies } (\varphi_*)^{-1}(F) \cap E = \varnothing \right\}$. Hence, ψ is a bijection $V \to W$ and satisfies $(\psi_*)^{-1}(F) \cap E = \varnothing$.

Let ρ be the map $\psi^{-1} : W \to V$. This map ρ is well-defined (since ψ is a bijection) and is a bijection itself (since $\rho = \psi^{-1}$).

But ψ is a bijection. Thus, ψ_* is a bijection as well, and satisfies $(\psi_*)^{-1} = \Big(\underbrace{\psi^{-1}}_{=\rho}\Big)_* = \rho_*$. Of course, ρ_* is also a bijection (since ρ is a bijection).

Now,

$$\begin{aligned} \rho_*\left((\rho_*)^{-1}(E) \cap F\right) &= \underbrace{\rho_*\left((\rho_*)^{-1}(E)\right)}_{\substack{=E \\ \text{(since } \rho_* \text{ is a bijection)}}} \cap \underbrace{\rho_*}_{=(\psi_*)^{-1}}(F) \qquad \text{(since } \rho_* \text{ is a bijection)} \\ &= E \cap (\psi_*)^{-1}(F) = (\psi_*)^{-1}(F) \cap E = \varnothing. \end{aligned}$$

Thus,

$$\begin{aligned} (\rho_*)^{-1}(E) \cap F &= \rho_*(\varnothing) \qquad \text{(since } \rho_* \text{ is a bijection)} \\ &= \varnothing. \end{aligned}$$

Hence, $\rho : W \to V$ is a bijection and satisfies $(\rho_*)^{-1}(E) \cap F = 0$. In other words,

$$\rho \in \left\{ \varphi : W \to V \ \mid \ \varphi \text{ is a bijection and satisfies } (\varphi_*)^{-1}(E) \cap F = \varnothing \right\} = \mathfrak{Q}.$$

Thus, $\psi^{-1} = \rho \in \mathfrak{Q}$, qed.

[1242] *Proof.* Every $\psi \in \mathfrak{P}$ satisfies

$$\begin{aligned} (\mathbf{B} \circ \mathbf{A})(\psi) = \mathbf{B}\left(\underbrace{\mathbf{A}(\psi)}_{\substack{=\psi^{-1} \\ \text{(by the definition} \\ \text{of } \mathbf{A})}}\right) &= \mathbf{B}\left(\psi^{-1}\right) = \left(\psi^{-1}\right)^{-1} \qquad \text{(by the definition of } \mathbf{B}) \\ &= \psi = \operatorname{id}(\psi). \end{aligned}$$

Hence, $\mathbf{B} \circ \mathbf{A} = \operatorname{id}$. Similarly, $\mathbf{A} \circ \mathbf{B} = \operatorname{id}$. Combining this with $\mathbf{B} \circ \mathbf{A} = \operatorname{id}$, we conclude that the maps $\mathbf{A}$ and $\mathbf{B}$ are mutually inverse. Qed.

Proof of Proposition 7.3.13. In this proof, we shall use all the notations that appeared in Definition 7.3.12. We shall also use the fact that the family $\left([G]^\sharp\right)_{[G] \text{ is an isomorphism class of finite graphs}}$ is a basis of the $\mathbf{k}$-module $\mathcal{G}$. (This fact is Proposition 7.3.9(b).)

(a) We first notice that any two finite graphs G and H satisfy

$$\left(\psi\left([G]^\sharp\right)\right)[H] = |\operatorname{Iso}(G,H)| \qquad (13.196.14)$$

[1243]. Now, let $a \in \mathcal{G}$ and $b \in \mathcal{G}$. We want to prove the equality $(\psi(a))(b) = (a,b)$. This equality is $\mathbf{k}$-linear in each of a and b. Thus, we can WLOG assume that a belongs to the family $\left([G]^\sharp\right)_{[G] \text{ is an isomorphism class of finite graphs}}$ and that b belongs to the family $([G])_{[G] \text{ is an isomorphism class of finite graphs}}$ (because both of these families are bases of the $\mathbf{k}$-module $\mathcal{G}$). Assume this. Then, $a = [G]^\sharp$ and $b = [H]$ for two finite graphs G and H. Consider these G and H. Now,

$$\begin{aligned}
\left(\psi\left(\underbrace{a}_{=[G]^\sharp}\right)\right)\left(\underbrace{b}_{=[H]}\right) &= \left(\psi\left([G]^\sharp\right)\right)[H] = |\operatorname{Iso}(G,H)| && (\text{by } (13.196.14)) \\
&= \left(\underbrace{[G]^\sharp}_{=a}, \underbrace{[H]}_{=b}\right) && \left(\text{since } \left([G]^\sharp, [H]\right) = |\operatorname{Iso}(G,H)|\right) \\
&= (a,b).
\end{aligned}$$

This proves Proposition 7.3.13(a).

[1243] *Proof of (13.196.14):* Let G and H be two finite graphs. Then,

$$\left(\underbrace{\psi\left([G]^\sharp\right)}_{=\operatorname{aut}(G)\cdot[G]^*}\right)[H] = \left(\operatorname{aut}(G)\cdot[G]^*\right)[H] = \operatorname{aut}(G)\cdot \underbrace{[G]^*[H]}_{=\delta_{[G],[H]}} = \operatorname{aut}(G)\cdot\delta_{[G],[H]}.$$

We are in one of the following two cases:

Case 1: The graphs G and H are isomorphic.

Case 2: The graphs G and H are not isomorphic.

Let us first consider Case 1. In this case, the graphs G and H are isomorphic. In other words, there exists a graph isomorphism α from G to H. Consider this α. Then,

$$\begin{aligned}
\operatorname{Iso}(G,G) &\to \operatorname{Iso}(G,H), \\
\psi &\mapsto \alpha\circ\psi
\end{aligned}$$

is a bijection (this is very easy to check). Thus, there exists a bijection $\operatorname{Iso}(G,G)\to\operatorname{Iso}(G,H)$. Hence, $|\operatorname{Iso}(G,G)| = |\operatorname{Iso}(G,H)|$. But the definition of $\operatorname{aut}(G)$ yields $\operatorname{aut}(G) = |\operatorname{Iso}(G,G)|$. Now,

$$\left(\psi\left([G]^\sharp\right)\right)[H] = \operatorname{aut}(G)\cdot \underbrace{\delta_{[G],[H]}}_{\substack{=1 \\ (\text{since } [G]=[H] \\ (\text{because the graphs } G \\ \text{and } H \text{ are isomorphic}))}} = \operatorname{aut}(G) = |\operatorname{Iso}(G,G)| = |\operatorname{Iso}(G,H)|.$$

Hence, (13.196.14) is proven in Case 1.

Let us now consider Case 2. In this case, the graphs G and H are not isomorphic. Thus, $[G] \neq [H]$, so that $\delta_{[G],[H]} = 0$.

But the graphs G and H are not isomorphic. Hence, the set of all isomorphisms from G to H is empty. In other words, $\operatorname{Iso}(G,H) = \varnothing$ (since $\operatorname{Iso}(G,H)$ is the set of all isomorphisms from G to H). Hence, $|\operatorname{Iso}(G,H)| = |\varnothing| = 0$. Now,

$$\left(\psi\left([G]^\sharp\right)\right)[H] = \operatorname{aut}(G)\cdot\underbrace{\delta_{[G],[H]}}_{=0} = 0 = |\operatorname{Iso}(G,H)|.$$

Hence, (13.196.14) is proven in Case 2.

Now, (13.196.14) is proven in both Cases 1 and 2. Hence, (13.196.14) always holds.

(b) We have $\psi(1_{\mathcal{G}}) = 1_{\mathcal{G}^o}$ [1244]. Also, every $a \in \mathcal{G}$ and $b \in \mathcal{G}$ satisfy $\psi(ab) = \psi(a) \cdot \psi(b)$ [1245]. Hence, $\psi : \mathcal{G} \to \mathcal{G}^o$ is a **k**-algebra morphism (since $\psi(1_{\mathcal{G}}) = 1_{\mathcal{G}^o}$).

Next, we notice that the **k**-linear map ψ is graded (because for any finite graph G, both $[G]^\sharp$ and $[G]^*$ are homogeneous elements having degree $|G|$). Thus, the **k**-linear map $\psi : \mathcal{G} \to \mathcal{G}^o$ gives rise to an adjoint **k**-linear map $\psi^* : (\mathcal{G}^o)^o \to \mathcal{G}^o$.

Now, the canonical **k**-module homomorphism $\mathcal{G} \to (\mathcal{G}^o)^o$ (which sends every $a \in \mathcal{G}$ to the map $\mathcal{G}^o \to \mathbf{k},\ f \mapsto f(a)$) is a **k**-module isomorphism (since $\mathcal{G}$ is of finite type). We thus identify $\mathcal{G}$ with $(\mathcal{G}^o)^o$ along this

[1244] *Proof.* Let $\mathbf{0}$ denote the empty graph.

We have $1_{\mathcal{G}^o} = \epsilon_{\mathcal{G}}$ (by the definition of the **k**-algebra $\mathcal{G}^o$). Thus, for every finite graph G, we have

$$\underbrace{1_{\mathcal{G}^o}}_{=\epsilon_{\mathcal{G}}}([G]) = \epsilon_{\mathcal{G}}([G]) = \delta_{[G],[\mathbf{0}]} \qquad \text{(by the definition of } \epsilon_{\mathcal{G}})$$
$$= \delta_{[\mathbf{0}],[G]} = [\mathbf{0}]^*[G] \qquad \left(\text{since } [\mathbf{0}]^*[G] = \delta_{[\mathbf{0}],[G]} \text{ (by the definition of } [\mathbf{0}]^*)\right).$$

Hence, the two maps $1_{\mathcal{G}^o}$ and $[\mathbf{0}]^*$ are equal to each other on every element of the basis $([G])_{[G] \text{ is an isomorphism class of finite graphs}}$ of $\mathcal{G}$. Since these two maps are **k**-linear, this yields that these two maps $1_{\mathcal{G}^o}$ and $[\mathbf{0}]^*$ are identical. In other words, $1_{\mathcal{G}^o} = [\mathbf{0}]^*$.

On the other hand, the definition of $[\mathbf{0}]^\sharp$ readily yields $[\mathbf{0}]^\sharp = [\mathbf{0}] = 1_{\mathcal{G}}$. But the definition of ψ yields $\psi\left([\mathbf{0}]^\sharp\right) = \underbrace{\operatorname{aut}(\mathbf{0})}_{=1} \cdot [\mathbf{0}]^* = [\mathbf{0}]^* = 1_{\mathcal{G}^o}$ (since $1_{\mathcal{G}^o} = [\mathbf{0}]^*$), so that $1_{\mathcal{G}^o} = \psi\left(\underbrace{[\mathbf{0}]^\sharp}_{=1_{\mathcal{G}}}\right) = \psi(1_{\mathcal{G}})$, qed.

[1245] *Proof.* Let $a \in \mathcal{G}$ and $b \in \mathcal{G}$. We need to prove the equality $\psi(ab) = \psi(a) \cdot \psi(b)$. Since this equality is **k**-linear in each of a and b, we can WLOG assume that a and b are elements of the family $\left([G]^\sharp\right)_{[G] \text{ is an isomorphism class of finite graphs}}$ (because this family is a basis of the **k**-module $\mathcal{G}$). Assume this.

There exist two finite graphs H_1 and H_2 such that $a = [H_1]^\sharp$ and $b = [H_2]^\sharp$ (since a and b are elements of the family $\left([G]^\sharp\right)_{[G] \text{ is an isomorphism class of finite graphs}}$). Consider these H_1 and H_2. Write the graphs H_1 and H_2 in the forms $H_1 = (V_1, E_1)$ and $H_2 = (V_2, E_2)$.

Multiplying the equalities $a = [H_1]^\sharp$ and $b = [H_2]^\sharp$, we obtain

$$ab = [H_1]^\sharp [H_2]^\sharp = \sum_{\substack{H=(V_1 \sqcup V_2, E);\\ H|_{V_1}=H_1;\\ H|_{V_2}=H_2}} [H]^\sharp \qquad \text{(by Proposition 7.3.9(d))}.$$

Now, fix a finite graph G. We shall show that $(\psi(ab))[G] = (\psi(a) \cdot \psi(b))[G]$.

Write the graph G in the form $G = (V, F)$. Then,

$$\left(\psi \underbrace{(ab)}_{= \sum_{\substack{H=(V_1 \sqcup V_2, E);\\ H|_{V_1}=H_1;\\ H|_{V_2}=H_2}} [H]^\sharp}\right)[G] = \left(\psi\left(\sum_{\substack{H=(V_1 \sqcup V_2, E);\\ H|_{V_1}=H_1;\\ H|_{V_2}=H_2}} [H]^\sharp\right)\right)[G] = \sum_{\substack{H=(V_1 \sqcup V_2, E);\\ H|_{V_1}=H_1;\\ H|_{V_2}=H_2}} \underbrace{\psi\left([H]^\sharp\right)[G]}_{\substack{=|\operatorname{Iso}(H,G)|\\ \text{(by (13.196.14), applied to}\\ H \text{ and } G \text{ instead of } G \text{ and } H)}}$$
$$= \sum_{\substack{H=(V_1 \sqcup V_2, E);\\ H|_{V_1}=H_1;\\ H|_{V_2}=H_2}} |\operatorname{Iso}(H,G)| = \left| \bigsqcup_{\substack{H=(V_1 \sqcup V_2, E);\\ H|_{V_1}=H_1;\\ H|_{V_2}=H_2}} \operatorname{Iso}(H,G) \right|.$$

On the other hand, Exercise 1.6.1(b) shows that the **k**-algebra structure defined on $\mathcal{G}^*$ is precisely the one defined on $\operatorname{Hom}(\mathcal{G}, \mathbf{k}) = \mathcal{G}^*$ according to Definition 1.4.1. Thus, the product of two elements of $\mathcal{G}^*$ is the convolution of these elements (viewed as maps from $\mathcal{G}$ to **k**). Applying this to the two elements $\psi(a)$ and $\psi(b)$, we obtain $\psi(a) \cdot \psi(b) = \psi(a) \star \psi(b) =$

$m_{\mathbf{k}} \circ (\psi(a) \otimes \psi(b)) \circ \Delta_{\mathcal{G}}$, so that

$$\begin{aligned}
(\psi(a) \cdot \psi(b))[G] &= (m_{\mathbf{k}} \circ (\psi(a) \otimes \psi(b)) \circ \Delta_{\mathcal{G}})([G]) \\
&= \left(m_{\mathbf{k}} \circ \left(\psi\left(\underbrace{a}_{=[H_1]^{\sharp}}\right) \otimes \psi\left(\underbrace{b}_{=[H_2]^{\sharp}}\right)\right)\right) \left(\underbrace{\Delta_{\mathcal{G}}([G])}_{\substack{=\sum_{\substack{(V_1,V_2);\\ V_1 \sqcup V_2 = V}} [G|_{V_1}] \otimes [G|_{V_2}] \\ \text{(by the definition of } \Delta_{\mathcal{G}})}}\right) \\
&= \left(m_{\mathbf{k}} \circ \left(\psi\left([H_1]^{\sharp}\right) \otimes \psi\left([H_2]^{\sharp}\right)\right)\right) \left(\sum_{\substack{(V_1,V_2);\\ V_1 \sqcup V_2 = V}} [G\mid_{V_1}] \otimes [G\mid_{V_2}]\right) \\
&= m_{\mathbf{k}} \left(\sum_{\substack{(V_1,V_2);\\ V_1 \sqcup V_2 = V}} \underbrace{\left(\psi\left([H_1]^{\sharp}\right) \otimes \psi\left([H_2]^{\sharp}\right)\right)([G\mid_{V_1}] \otimes [G\mid_{V_2}])}_{=(\psi([H_1]^{\sharp}))[G|_{V_1}] \otimes (\psi([H_2]^{\sharp}))[G|_{V_2}]}\right) \\
&= m_{\mathbf{k}} \left(\sum_{\substack{(V_1,V_2);\\ V_1 \sqcup V_2 = V}} \left(\psi\left([H_1]^{\sharp}\right)\right)[G\mid_{V_1}] \otimes \left(\psi\left([H_2]^{\sharp}\right)\right)[G\mid_{V_2}]\right) \\
&= \sum_{\substack{(V_1,V_2);\\ V_1 \sqcup V_2 = V}} \underbrace{\left(\psi\left([H_1]^{\sharp}\right)\right)[G\mid_{V_1}]}_{\substack{=\left|\operatorname{Iso}\left(H_1, G|_{V_1}\right)\right| \\ \text{(by (13.196.14), applied to} \\ H_1 \text{ and } G|_{V_1} \text{ instead of } G \text{ and } H)}} \cdot \underbrace{\left(\psi\left([H_2]^{\sharp}\right)\right)[G\mid_{V_2}]}_{\substack{=\left|\operatorname{Iso}\left(H_2, G|_{V_2}\right)\right| \\ \text{(by (13.196.14), applied to} \\ H_2 \text{ and } G|_{V_2} \text{ instead of } G \text{ and } H)}} \\
&= \sum_{\substack{(V_1,V_2);\\ V_1 \sqcup V_2 = V}} \left|\operatorname{Iso}\left(H_1, G\mid_{V_1}\right)\right| \cdot \left|\operatorname{Iso}\left(H_2, G\mid_{V_2}\right)\right| = \sum_{\substack{(W_1,W_2);\\ W_1 \sqcup W_2 = V}} \left|\operatorname{Iso}\left(H_1, G\mid_{W_1}\right)\right| \cdot \left|\operatorname{Iso}\left(H_2, G\mid_{W_2}\right)\right| \\
&= \left|\bigsqcup_{\substack{(W_1,W_2);\\ W_1 \sqcup W_2 = V}} \operatorname{Iso}\left(H_1, G\mid_{W_1}\right) \times \operatorname{Iso}\left(H_2, G\mid_{W_2}\right)\right|.
\end{aligned}$$

Now, we are going to construct a bijection between the sets

$$\bigsqcup_{\substack{H=(V_1 \sqcup V_2, E);\\ H|_{V_1} = H_1;\\ H|_{V_2} = H_2}} \operatorname{Iso}(H, G) \qquad \text{and} \qquad \bigsqcup_{\substack{(W_1,W_2);\\ W_1 \sqcup W_2 = V}} \operatorname{Iso}\left(H_1, G\mid_{W_1}\right) \times \operatorname{Iso}\left(H_2, G\mid_{W_2}\right).$$

First, let us agree to encode the elements of the set

$$\bigsqcup_{\substack{H=(V_1 \sqcup V_2, E);\\ H|_{V_1} = H_1;\\ H|_{V_2} = H_2}} \operatorname{Iso}(H, G)$$

as triples (H, E, φ) consisting of a graph $H = (V_1 \sqcup V_2, E)$, its set of edges E, and an isomorphism $\varphi \in \operatorname{Iso}(H, G)$. Let us also agree to encode the elements of the set

$$\bigsqcup_{\substack{(W_1,W_2);\\ W_1 \sqcup W_2 = V}} \operatorname{Iso}\left(H_1, G\mid_{W_1}\right) \times \operatorname{Iso}\left(H_2, G\mid_{W_2}\right)$$

as triples $((W_1, W_2), \varphi_1, \varphi_2)$ consisting of a pair (W_1, W_2) of subsets of V (which satisfies $W_1 \sqcup W_2 = V$), an isomorphism $\varphi_1 \in \operatorname{Iso}\left(H_1, G\mid_{W_1}\right)$, and an isomorphism $\varphi_2 \in \operatorname{Iso}\left(H_2, G\mid_{W_2}\right)$.

isomorphism. Then, $(\mathcal{G}^o)^o = \mathcal{G}$ as Hopf algebras[1246]. Therefore, $\psi : (\mathcal{G}^o)^o \to \mathcal{G}^o$ is a $\mathbf{k}$-algebra morphism (since $\psi : \mathcal{G} \to \mathcal{G}^o$ is a $\mathbf{k}$-algebra morphism). Also, $\mathcal{G}^o$ is of finite type (since $\mathcal{G}$ is of finite type). Thus, Exercise 1.6.1(f) (applied to $C = \mathcal{G}$, $D = \mathcal{G}^o$ and $f = \psi$) yields that $\psi : \mathcal{G} \to \mathcal{G}^o$ is a $\mathbf{k}$-coalgebra morphism if and only if $\psi^* : (\mathcal{G}^o)^o \to \mathcal{G}^o$ is a $\mathbf{k}$-algebra morphism.

Let us now prove that $\psi^* = \psi$ (as maps from $\mathcal{G}$ to $\mathcal{G}^o$). Indeed, let $a \in \mathcal{G}$. Then, every $b \in \mathcal{G}$ satisfies

$$\begin{aligned}
(\psi^*(a))(b) &= a(\psi(b)) && \left(\begin{array}{c}\text{by the definition of the adjoint map } \psi^* : (\mathcal{G}^o)^o \to \mathcal{G}^o, \\ \text{where } a \in \mathcal{G} \text{ is regarded as an element of } (\mathcal{G}^o)^o\end{array}\right) \\
&= (\psi(b))(a) && \left(\begin{array}{c}\text{because the } \mathbf{k}\text{-module homomorphism } \mathcal{G} \to (\mathcal{G}^o)^o \text{ which we use to} \\ \text{identify } \mathcal{G} \text{ with } (\mathcal{G}^o)^o \text{ sends } a \in \mathcal{G} \text{ to the map } \mathcal{G}^o \to \mathbf{k},\ f \mapsto f(a)\end{array}\right) \\
&= (b, a) && (\text{by Proposition 7.3.13(a), applied to } b \text{ and } a \text{ instead of } a \text{ and } b) \\
&= (a, b) && (\text{since the form } (\cdot,\cdot) : \mathcal{G} \times \mathcal{G} \to \mathbf{k} \text{ is symmetric}) \\
&= (\psi(a))(b) && (\text{by Proposition 7.3.13(a)}).
\end{aligned}$$

Hence, $\psi^*(a) = \psi(a)$. Now, let us forget that we fixed a. We thus have shown that $\psi^*(a) = \psi(a)$ for every $a \in \mathcal{G}$. In other words, $\psi^* = \psi$. Hence, $\psi^* : (\mathcal{G}^o)^o \to \mathcal{G}^o$ is a $\mathbf{k}$-algebra morphism (since $\psi : (\mathcal{G}^o)^o \to \mathcal{G}^o$ is a $\mathbf{k}$-algebra morphism). Thus, $\psi : \mathcal{G} \to \mathcal{G}^o$ is a $\mathbf{k}$-coalgebra morphism (because we know that $\psi : \mathcal{G} \to \mathcal{G}^o$ is a $\mathbf{k}$-coalgebra morphism if and only if $\psi^* : (\mathcal{G}^o)^o \to \mathcal{G}^o$ is a $\mathbf{k}$-algebra morphism). This yields that $\psi : \mathcal{G} \to \mathcal{G}^o$ is a $\mathbf{k}$-bialgebra morphism (since we already know that $\psi : \mathcal{G} \to \mathcal{G}^o$ is a $\mathbf{k}$-algebra morphism). Thus, $\psi : \mathcal{G} \to \mathcal{G}^o$ is a Hopf algebra homomorphism (by Corollary 1.4.27, applied to $H_1 = \mathcal{G}$, $H_2 = \mathcal{G}^o$, $S_1 = S_{\mathcal{G}}$, $S_2 = S_{\mathcal{G}^o}$ and $\beta = \psi$). This proves Proposition 7.3.13(b).

Now, we claim that there exists a bijection from the set

$$\bigsqcup_{\substack{H=(V_1 \sqcup V_2, E);\\ H|_{V_1} = H_1;\\ H|_{V_2} = H_2}} \operatorname{Iso}(H, G)$$

to the set

$$\bigsqcup_{\substack{(W_1, W_2);\\ W_1 \sqcup W_2 = V}} \operatorname{Iso}\left(H_1, G\mid_{W_1}\right) \times \operatorname{Iso}\left(H_2, G\mid_{W_2}\right).$$

Namely, this bijection sends every (H, E, φ) (where $H = (V_1 \sqcup V_2, E)$ and $\varphi \in \operatorname{Iso}(H, G)$) to $((\varphi(V_1), \varphi(V_2)), \varphi_1, \varphi_2)$, where $\varphi_1 : V_1 \to \varphi(V_1)$ is the isomorphism from H_1 to $G\mid_{\varphi(V_1)}$ which is obtained by restricting φ to V_1, and where φ_2 is the isomorphism from H_2 to $G_2\mid_{\varphi(V_2)}$ which is obtained by restricting φ to V_2. (The inverse map of this bijection sends every $((W_1, W_2), \varphi_1, \varphi_2)$ (with $W_1 \sqcup W_2 = V$ and $\varphi_1 \in \operatorname{Iso}\left(H_1, G\mid_{W_1}\right)$ and $\varphi_2 \in \operatorname{Iso}\left(H_2, G\mid_{W_2}\right)$) to $((V_1 \sqcup V_2, E), E, \varphi)$, where $\varphi : V_1 \sqcup V_2 \to V$ is the map glued together from the maps $\varphi_1 : V_1 \to W_1$ and $\varphi_2 : V_2 \to W_2$, and where $E = \left(\varphi^{-1}\right)_*(F)$.) The existence of this bijection yields

$$\left|\bigsqcup_{\substack{H=(V_1 \sqcup V_2, E);\\ H|_{V_1} = H_1;\\ H|_{V_2} = H_2}} \operatorname{Iso}(H, G)\right| = \left|\bigsqcup_{\substack{(W_1, W_2);\\ W_1 \sqcup W_2 = V}} \operatorname{Iso}\left(H_1, G\mid_{W_1}\right) \times \operatorname{Iso}\left(H_2, G\mid_{W_2}\right)\right|.$$

Hence,

$$(\psi(ab))[G] = \left|\bigsqcup_{\substack{H=(V_1 \sqcup V_2, E);\\ H|_{V_1} = H_1;\\ H|_{V_2} = H_2}} \operatorname{Iso}(H, G)\right| = \left|\bigsqcup_{\substack{(W_1, W_2);\\ W_1 \sqcup W_2 = V}} \operatorname{Iso}\left(H_1, G\mid_{W_1}\right) \times \operatorname{Iso}\left(H_2, G\mid_{W_2}\right)\right| = (\psi(a) \cdot \psi(b))[G].$$

Let us now forget that we fixed G. We thus have shown that $(\psi(ab))[G] = (\psi(a) \cdot \psi(b))[G]$ for any finite graph G. In other words, the two maps $\psi(ab)$ and $\psi(a) \cdot \psi(b)$ are equal to each other on every element of the basis $([G])_{[G] \text{ is an isomorphism class of finite graphs}}$ of $\mathcal{G}$. Since these two maps are $\mathbf{k}$-linear, this yields that these two maps $\psi(ab)$ and $\psi(a) \cdot \psi(b)$ are identical. In other words, $\psi(ab) = \psi(a) \cdot \psi(b)$. Qed.

[1246] This is because the Hopf algebra structure on $\mathcal{G}^o$ was defined by taking adjoints of the structure maps of the Hopf algebra structure on $\mathcal{G}$ (for example, the comultiplication $\Delta_{\mathcal{G}^o}$ on $\mathcal{G}^o$ is the adjoint of the multiplication $m_{\mathcal{G}}$ on $\mathcal{G}$, if $(\mathcal{G} \otimes \mathcal{G})^o$ is identified with $\mathcal{G}^o \otimes \mathcal{G}^o$), and the Hopf algebra structure on $(\mathcal{G}^o)^o$ was defined by taking adjoints of the structure maps of the Hopf algebra structure on $\mathcal{G}^o$; but the adjoint of the adjoint of a linear map F between two graded $\mathbf{k}$-modules of finite type is the map F again.

(c) Assume that $\mathbb{Q}$ is a subring of $\mathbf{k}$. Then, $\operatorname{aut}(G)$ is invertible for every finite graph G (because $\operatorname{aut}(G)$ is a positive integer). Hence, $\left(\operatorname{aut}(G)\cdot [G]^*\right)_{[G] \text{ is an isomorphism class of finite graphs}}$ is a basis of the $\mathbf{k}$-module $\mathcal{G}^o$ (because $\left([G]^*\right)_{[G] \text{ is an isomorphism class of finite graphs}}$ is a basis of this $\mathbf{k}$-module). The map ψ thus sends the basis $\left([G]^\sharp\right)_{[G] \text{ is an isomorphism class of finite graphs}}$ of the $\mathbf{k}$-module $\mathcal{G}$ to the basis $\left(\operatorname{aut}(G)\cdot [G]^*\right)_{[G] \text{ is an isomorphism class of finite graphs}}$ of the $\mathbf{k}$-module $\mathcal{G}^o$ (because it satisfies $\psi\left([G]^\sharp\right) = \operatorname{aut}(G)\cdot [G]^*$ for every finite graph G). Hence, the $\mathbf{k}$-linear map ψ sends a basis of its domain to a basis of its codomain. Therefore, the map ψ is a $\mathbf{k}$-module isomorphism. Combined with the fact that ψ is a Hopf algebra homomorphism, this yields that ψ is a Hopf algebra isomorphism. Proposition 7.3.13(c) is thus proven. □

Now, all of Proposition 7.3.9, Proposition 7.3.11 and Proposition 7.3.13 are proven. Therefore, Exercise 7.3.14 is solved.

13.197. **Solution to Exercise 7.3.25.** *Solution to Exercise 7.3.25.* Proposition 7.3.9(b) yields that the elements $[G]^\sharp$, where $[G]$ ranges over all isomorphism classes of finite graphs, form a basis of the $\mathbf{k}$-module $\mathcal{G}$. Hence, we can define a $\mathbf{k}$-linear map $\Psi' : \mathcal{G} \to \mathbf{k}$ by requiring that

$$\Psi'\left([G]^\sharp\right) = \sum_{\substack{f:V\to\{1,2,3,\ldots\};\\ \operatorname{eqs} f = E}} \mathbf{x}_f \qquad \text{for every finite graph } G=(V,E)$$

(because $\sum_{\substack{f:V\to\{1,2,3,\ldots\};\\ \operatorname{eqs} f = E}} \mathbf{x}_f$ depends only on the isomorphism class $[G]$, but not on the graph G itself). Consider this map Ψ'. We shall show that $\Psi' = \Psi$.

Indeed, let $G=(V,E)$ be any finite graph. Then, Proposition 7.3.9(a) yields $[G] = \sum_{\substack{H=(V,E');\\ E'\cap E=\varnothing}} [H]^\sharp$. Applying the map Ψ' to both sides of this equality, we obtain

$$\Psi'[G] = \Psi'\left(\sum_{\substack{H=(V,E');\\ E'\cap E=\varnothing}} [H]^\sharp\right) = \sum_{\substack{H=(V,E');\\ E'\cap E=\varnothing}} \underbrace{\Psi'\left([H]^\sharp\right)}_{\substack{=\sum_{\substack{f:V\to\{1,2,3,\ldots\};\\ \operatorname{eqs} f=E'}} \mathbf{x}_f \\ \text{(by the definition of } \Psi')}} \qquad \text{(since the map } \Psi' \text{ is } \mathbf{k}\text{-linear)}$$

$$= \underbrace{\sum_{\substack{H=(V,E');\\ E'\cap E=\varnothing}}}_{=\sum_{\substack{E' \text{ is a set of two-element}\\ \text{subsets of } V;\\ E'\cap E=\varnothing}}} \sum_{\substack{f:V\to\{1,2,3,\ldots\};\\ \operatorname{eqs} f=E'}} \mathbf{x}_f = \underbrace{\sum_{\substack{E' \text{ is a set of two-element}\\ \text{subsets of } V;\\ E'\cap E=\varnothing}} \sum_{\substack{f:V\to\{1,2,3,\ldots\};\\ \operatorname{eqs} f=E'}}}_{=\sum_{\substack{f:V\to\{1,2,3,\ldots\};\\ (\operatorname{eqs} f)\cap E=\varnothing}}} \mathbf{x}_f$$

$$= \sum_{\substack{f:V\to\{1,2,3,\ldots\};\\ (\operatorname{eqs} f)\cap E=\varnothing}} \mathbf{x}_f. \tag{13.197.1}$$

However, if $f : V \to \{1,2,3,\ldots\}$ is any map, then we have the following logical equivalence:

$$((\operatorname{eqs} f)\cap E = \varnothing) \iff (f \text{ is a proper coloring of } G). \tag{13.197.2}$$

[1247] Hence, (13.197.1) becomes

$$\Psi'[G] = \underbrace{\sum_{\substack{f:V\to\{1,2,3,\ldots\};\\ (\operatorname{eqs} f)\cap E=\varnothing}}}_{\substack{=\sum_{\substack{f:V\to\{1,2,3,\ldots\};\\ f \text{ is a proper}\\ \text{coloring of } G}}\\ \text{(because of the equivalence (13.197.2))}}} \mathbf{x}_f = \underbrace{\sum_{\substack{f:V\to\{1,2,3,\ldots\};\\ f \text{ is a proper}\\ \text{coloring of } G}}}_{=\sum_{\substack{\text{proper colorings}\\ f:V\to\{1,2,3,\ldots\}}}} \mathbf{x}_f = \sum_{\substack{\text{proper colorings}\\ f:V\to\{1,2,3,\ldots\}}} \mathbf{x}_f$$

$$= \Psi[G] \qquad \left(\text{since Proposition 7.3.17 yields } \Psi[G] = \sum_{\substack{\text{proper colorings}\\ f:V\to\{1,2,3,\ldots\}}} \mathbf{x}_f\right).$$

Let us now forget that we fixed $[G]$. Thus, we have shown that $\Psi'[G] = \Psi[G]$ for any finite graph G. In other words, the two maps Ψ' and Ψ are equal to each other on each element of the family $([G])_{G \text{ is an isomorphism class of finite graphs}}$. Thus, the two maps Ψ' and Ψ must be identical (because these two maps are $\mathbf{k}$-linear, and because the family $([G])_{G \text{ is an isomorphism class of finite graphs}}$ is a basis of the $\mathbf{k}$-module $\mathcal{G}$). In other words, $\Psi' = \Psi$. Now, every finite graph $G = (V, E)$ satisfies

$$\underbrace{\Psi}_{=\Psi'}\left([G]^{\sharp}\right) = \Psi'\left([G]^{\sharp}\right) = \sum_{\substack{f:V\to\{1,2,3,\ldots\};\\ \operatorname{eqs} f=E}} \mathbf{x}_f.$$

This solves Exercise 7.3.25.

13.198. **Solution to Exercise 8.1.10.** *Solution to Exercise 8.1.10.* We begin with some preparations.

We shall regard permutations as words (over the alphabet $\{1,2,3,\ldots\}$), by identifying every permutation $\pi \in \mathfrak{S}_n$ with the word $(\pi(1), \pi(2), \ldots, \pi(n))$. For every $n \in \mathbb{N}$, the lexicographic order on words thus

[1247] *Proof of (13.197.2):* Let $f : V \to \{1,2,3,\ldots\}$ be any map.

Let us first assume that $(\operatorname{eqs} f) \cap E = \varnothing$. We shall then show that f is a proper coloring of G.

Indeed, let us assume that there exists an edge $e = \{v, v'\}$ in E such that $f(v) = f(v')$. Consider this edge $e = \{v, v'\}$. We are going to derive a contradiction.

The definition of $\operatorname{eqs} f$ yields $\operatorname{eqs} f = \{\{u, u'\} \mid u \in V,\ u' \in V,\ u \neq u' \text{ and } f(u) = f(u')\}$. But $v \in V$ and $v' \in V$ and $v \neq v'$ (since $\{v, v'\}$ is an edge of E) and $f(v) = f(v')$. Hence,

$$\{v, v'\} \in \left\{\{u, u'\} \mid u \in V,\ u' \in V,\ u \neq u' \text{ and } f(u) = f(u')\right\} = \operatorname{eqs} f.$$

Combined with $\{v, v'\} \in E$, this yields $\{v, v'\} \in (\operatorname{eqs} f) \cap E = \varnothing$. But this is absurd, because the empty set $\varnothing$ has no elements. Hence, we have found a contradiction. Thus, our assumption (that there exists an edge $e = \{v, v'\}$ in E such that $f(v) = f(v')$) was wrong. Hence, no edge $e = \{v, v'\}$ in E has $f(v) = f(v')$. In other words, f is a proper coloring of G (according to the definition of a "proper coloring").

Let us now forget that we assumed that $(\operatorname{eqs} f) \cap E = \varnothing$. We thus have proven the implication

$$((\operatorname{eqs} f) \cap E = \varnothing) \implies (f \text{ is a proper coloring of } G). \tag{13.197.3}$$

Let us now assume that f is a proper coloring of G. In other words, no edge $e = \{v, v'\}$ in E has $f(v) = f(v')$ (according to the definition of a "proper coloring").

Now, let us prove that $(\operatorname{eqs} f) \cap E = \varnothing$. Indeed, assume the contrary. Then, $(\operatorname{eqs} f) \cap E \neq \varnothing$. Hence, there exists some $g \in (\operatorname{eqs} f) \cap E$. Consider this g. We have

$$g \in (\operatorname{eqs} f) \cap E \subset \operatorname{eqs} f = \left\{\{u, u'\} \mid u \in V,\ u' \in V,\ u \neq u' \text{ and } f(u) = f(u')\right\}.$$

Hence, $g = \{u, u'\}$ for some $u \in V$ and $u' \in V$ satisfying $u \neq u'$ and $f(u) = f(u')$. Consider these u and u'. We have $u \neq u'$ and $\{u, u'\} = g \in (\operatorname{eqs} f) \cap E \subset E$. Hence, $\{u, u'\}$ is an edge in E. Moreover, $f(u) = f(u')$. Hence, the edge $\{u, u'\}$ is an edge $e = \{v, v'\}$ in E such that $f(v) = f(v')$ (namely, for $v = u$ and $v' = u'$). This contradicts the fact that no edge $e = \{v, v'\}$ in E has $f(v) = f(v')$. This contradiction proves that our assumption was wrong. Hence, we have shown that $(\operatorname{eqs} f) \cap E = \varnothing$.

Let us now forget that we assumed that (f is a proper coloring of G). We thus have proven the implication

$$(f \text{ is a proper coloring of } G) \implies ((\operatorname{eqs} f) \cap E = \varnothing).$$

Combining this with (13.197.3), we obtain the equivalence

$$((\operatorname{eqs} f) \cap E = \varnothing) \iff (f \text{ is a proper coloring of } G).$$

This proves (13.197.2).

defines a total order on $\mathfrak{S}_n$; we will be using this order in the following when we make statements like "$\sigma < \tau$" for σ and τ being two permutations in $\mathfrak{S}_n$.

We denote the empty word by $\varnothing$. This empty word is identified with the trivial permutation in $\mathfrak{S}_0$. We shall refer to $\varnothing$ as the *empty permutation*. Every permutation other than $\varnothing$ will be called a *nonempty permutation*.

Let $\mathfrak{S}$ denote the disjoint union $\bigsqcup_{n\in\mathbb{N}} \mathfrak{S}_n$ of the posets $\mathfrak{S}_n$. While each poset $\mathfrak{S}_n$ is actually totally ordered (by the lexicographic order), the disjoint union $\mathfrak{S}$ is not, since elements of different $\mathfrak{S}_n$ are incomparable.[1248]

For every $k \in \mathbb{N}$ and $\ell \in \mathbb{N}$ and any permutations $u \in \mathfrak{S}_k$ and $v \in \mathfrak{S}_\ell$, we define a permutation $u \square v$ by $u \square v = u \cdot v\,[k]$ (where "$u \cdot v\,[k]$" has to be read as "$u \cdot (v\,[k])$" rather than as "$(u \cdot v)\,[k]$"). [1249] Thus, we have defined a binary operation $\square$ on the set $\mathfrak{S}$. It is easy to see that $\mathfrak{S}$ becomes a monoid with respect to this binary operation $\square$; the neutral element of this monoid is $\varnothing \in \mathfrak{S}_0$. Hence, products of the form $w_1 \square w_2 \square \cdots \square w_k$ for k-tuples $(w_1, w_2, \ldots, w_k) \in \mathfrak{S}^k$ of permutations are well-defined (without specifying a bracketing). The monoid $(\mathfrak{S}, \square)$ is left-cancellative[1250] and right-cancellative[1251].

It is easy to see that

$$\alpha \square \gamma > \beta \square \gamma \qquad (13.198.1)$$

for any $\alpha \in \mathfrak{S}$, $\beta \in \mathfrak{S}$ and $\gamma \in \mathfrak{S}$ satisfying $\alpha > \beta$ [1252].

Recall how we defined a connected permutation. Since we are regarding permutations as words, we can rewrite this definition as follows: A permutation $p \in \mathfrak{S}_n$ is connected if and only if it is nonempty and no nonempty proper prefix[1253] of p is itself a permutation. Hence, if a nonempty prefix of a connected permutation $p \in \mathfrak{S}_n$ is itself a permutation, then this prefix must be p.

It is easy to see that a permutation $w \in \mathfrak{S}_n$ is connected if and only if n is a positive integer and there exist no nonempty permutations u and v satisfying $w = u \square v$. It is furthermore easy to see that for every permutation $w \in \mathfrak{S}$, there is a unique way to write w in the form $w = w_1 \square w_2 \square \cdots \square w_k$ for some $k \in \mathbb{N}$ and

[1248] We could define an ordering on all of $\mathfrak{S}$ by restricting the total order on words defined in Definition 6.1.1; but we prefer not to.

[1249] This is indeed a permutation, because the word $u \cdot v\,[k]$ has each integer from 1 to $k + \ell$ appear exactly once in it.

[1250] A semigroup $(M, \cdot)$ is said to be *left-cancellative* if and only if it has the following property: If a, b and c are three elements of M satisfying $a \cdot b = a \cdot c$, then $b = c$.

[1251] A semigroup $(M, \cdot)$ is said to be *right-cancellative* if and only if it has the following property: If a, b and c are three elements of M satisfying $b \cdot a = c \cdot a$, then $b = c$.

[1252] *Proof of (13.198.1):* Let $\alpha \in \mathfrak{S}$, $\beta \in \mathfrak{S}$ and $\gamma \in \mathfrak{S}$ satisfy $\alpha > \beta$. Notice that the $n \in \mathbb{N}$ satisfying $\alpha \in \mathfrak{S}_n$ and the $n \in \mathbb{N}$ satisfying $\beta \in \mathfrak{S}_n$ must be identical (because otherwise, α and β would be incomparable in the poset $\mathfrak{S}$). In other words, the words α and β have the same length. Let k be this length. Thus, $\alpha \in \mathfrak{S}_k$ and $\beta \in \mathfrak{S}_k$.

Now, the words α and β have the same length and satisfy $\alpha > \beta$ in the lexicographic order. Hence, every word δ satisfies $\alpha \cdot \delta > \beta \cdot \delta$ (where $\cdot$ denotes concatenation). Applying this to $\delta = \gamma\,[k]$, we obtain $\alpha \cdot \gamma\,[k] > \beta \cdot \gamma\,[k]$. Now, the definition of $\alpha \square \gamma$ yields $\alpha \square \gamma = \alpha \cdot \gamma\,[k] > \beta \cdot \gamma\,[k] = \beta \square \gamma$ (by the definition of $\beta \square \gamma$), and thus (13.198.1) is proven.

[1253] A *proper prefix* of a word w is defined as a word u such that there exists a nonempty word v satisfying $w = uv$.

some k-tuple $(w_1, w_2, \ldots, w_k) \in \mathfrak{C}\mathfrak{S}^k$ of connected permutations[1254]. We refer to the tuple $(w_1, w_2, \ldots, w_k)$ as the *connected decomposition* of w.

For every $n \in \mathbb{N}$ and $w \in \mathfrak{S}_n$, define an element F_w^{conn} of FQSym by setting $F_w^{\mathrm{conn}} = F_{w_1} F_{w_2} \cdots F_{w_k}$, where $(w_1, w_2, \ldots, w_k)$ is the connected decomposition of w. It is clear that this F_w^{conn} is an element of FQSym_n. Hence, for every $n \in \mathbb{N}$, the family $(F_w^{\mathrm{conn}})_{w \in \mathfrak{S}_n}$ is a family of elements of FQSym_n. We shall prove that it is a basis of the $\mathbf{k}$-module FQSym_n. Once this is proven, the claim of the exercise will quickly follow (as we will see later).

We need the following easy fact:

Lemma 13.198.1. *Let $u \in \mathfrak{S}$ and $v \in \mathfrak{S}$. Then,*

$$F_u F_v = F_{u \square v} + (\text{a sum of terms } F_t \text{ for } t \in \mathfrak{S} \text{ satisfying } t > u \square v).$$

(The symbol $>$ refers to the partial order on the poset $\mathfrak{S}$.)

Proof of Lemma 13.198.1. Let k and ℓ be the nonnegative integers satisfying $u \in \mathfrak{S}_k$ and $v \in \mathfrak{S}_\ell$. Write the words u and $v[k]$ in the forms $u = (u_1, u_2, \ldots, u_k)$ and $v[k] = (p_1, p_2, \ldots, p_\ell)$, respectively. Let $(c_1, c_2, \ldots, c_{k+\ell})$ denote the concatenation $u \cdot v[k] = (u_1, u_2, \ldots, u_k, p_1, p_2, \ldots, p_\ell)$. By the definition of $u \sqcup\!\sqcup\, v[k]$, we therefore have

$$u \sqcup\!\sqcup\, v[k] = \left\{ \left(c_{w(1)}, c_{w(2)}, \ldots, c_{w(k+\ell)} \right) \ : \ w \in \mathrm{Sh}_{k,\ell} \right\}_{\text{multiset}}. \tag{13.198.2}$$

[1255] We also have $(c_1, c_2, \ldots, c_{k+\ell}) = u \cdot v[k] = u \square v$.

[1254] *Proof.* Fix $w \in \mathfrak{S}$. We need to show that a decomposition of w in the form $w = w_1 \square w_2 \square \cdots \square w_k$ with $k \in \mathbb{N}$ and $(w_1, w_2, \ldots, w_k) \in \mathfrak{C}\mathfrak{S}^k$ exists and is unique.

The existence of such a decomposition $w = w_1 \square w_2 \square \cdots \square w_k$ is easy to check (just take a decomposition $w = w_1 \square w_2 \square \cdots \square w_k$ with $k \in \mathbb{N}$ and $(w_1, w_2, \ldots, w_k) \in (\mathfrak{S} \setminus \{\varnothing\})^k$ such that k is maximum, and argue that the maximality of k forces each of w_1, w_2, $\ldots$, w_k to be connected). It remains to prove that such a decomposition is unique. In other words, we need to prove the following statement:

> *Statement $\mathcal{U}$:* If $w \in \mathfrak{S}$, $k \in \mathbb{N}$, $(w_1, w_2, \ldots, w_k) \in \mathfrak{C}\mathfrak{S}^k$, $\ell \in \mathbb{N}$ and $(v_1, v_2, \ldots, v_\ell) \in \mathfrak{C}\mathfrak{S}^\ell$ are such that $w = w_1 \square w_2 \square \cdots \square w_k$ and $w = v_1 \square v_2 \square \cdots \square v_\ell$, then $k = \ell$ and $(w_1, w_2, \ldots, w_k) = (v_1, v_2, \ldots, v_\ell)$.

Proof of Statement $\mathcal{U}$: Let us prove Statement $\mathcal{U}$ by strong induction by the size of w (that is, the number $n \in \mathbb{N}$ satisfying $w \in \mathfrak{S}_n$). So let $N \in \mathbb{N}$, and assume (as the induction hypothesis) that Statement $\mathcal{U}$ is proven in the case when $w \in \mathfrak{S}_M$ for $M < N$.

Let $w \in \mathfrak{S}_N$, $k \in \mathbb{N}$, $(w_1, w_2, \ldots, w_k) \in \mathfrak{C}\mathfrak{S}^k$, $\ell \in \mathbb{N}$ and $(v_1, v_2, \ldots, v_\ell) \in \mathfrak{C}\mathfrak{S}^\ell$ be such that $w = w_1 \square w_2 \square \cdots \square w_k$ and $w = v_1 \square v_2 \square \cdots \square v_\ell$. We need to show that $k = \ell$ and $(w_1, w_2, \ldots, w_k) = (v_1, v_2, \ldots, v_\ell)$.

All of the permutations w_1, w_2, $\ldots$, w_k and v_1, v_2, $\ldots$, v_ℓ are connected, and thus nonempty.

We assume WLOG that w is nonempty (else, Statement $\mathcal{U}$ is obvious). Hence, $k > 0$ and $\ell > 0$. Thus, w_1 and v_1 are well-defined. We shall now prove that $w_1 = v_1$.

By the definition of the operation $\square$, it is clear that the word v_1 is a prefix of the word $v_1 \square v_2 \square \cdots \square v_\ell$. In other words, the word v_1 is a prefix of the word w (since $w = v_1 \square v_2 \square \cdots \square v_\ell$). Similarly, the word w_1 is a prefix of the word w as well. But it is well-known that if α and β are two prefixes of a word γ, then either α is a prefix of β or β is a prefix of α. Applying this to $\alpha = v_1$, $\beta = w_1$ and $\gamma = w$, we conclude that either v_1 is a prefix of w_1 or w_1 is a prefix of v_1. We WLOG assume that v_1 is a prefix of w_1.

But recall that if a nonempty prefix of a connected permutation $p \in \mathfrak{S}_n$ is itself a permutation, then this prefix must be p. Applying this to $p = w_1$ and the nonempty prefix v_1 of w_1, we conclude that v_1 must be w_1. That is, $v_1 = w_1$.

Let now w' be the permutation $w_2 \square w_3 \square \cdots \square w_k$. Then,

$$\underbrace{v_1}_{=w_1} \square \underbrace{w'}_{=w_2 \square w_3 \square \cdots \square w_k} = w_1 \square (w_2 \square w_3 \square \cdots \square w_k) = w_1 \square w_2 \square \cdots \square w_k = w = v_1 \square v_2 \square \cdots \square v_\ell = v_1 \square (v_2 \square v_3 \square \cdots \square v_\ell).$$

Since the monoid $(\mathfrak{S}, \square)$ is left-cancellative, we can cancel v_1 from this equality, and obtain $w' = v_2 \square v_3 \square \cdots \square v_\ell$.

Now, let M be the length of the word w'. Since w' is shorter than the word $v_1 \square w' = w$ (because v_1 is nonempty), this length M is smaller than the length of w, which is N (since $w \in \mathfrak{S}_N$). Thus, $M < N$. Thus, we have $w' \in \mathfrak{S}_M$ with $M < N$. Hence, by the induction hypothesis, we can apply Statement $\mathcal{U}$ to w', $k-1$, $(w_2, w_3, \ldots, w_k)$, $\ell - 1$ and $(v_2, v_3, \ldots, v_\ell)$ instead of w, k, $(w_1, w_2, \ldots, w_k)$, ℓ and $(v_1, v_2, \ldots, v_\ell)$ (since $w' = w_2 \square w_3 \square \cdots \square w_k$ and $v' = v_2 \square v_3 \square \cdots \square v_\ell$). As a consequence, we obtain $k - 1 = \ell - 1$ and $(w_2, w_3, \ldots, w_k) = (v_2, v_3, \ldots, v_\ell)$. From $k - 1 = \ell - 1$, we obtain $k = \ell$. Combining $w_1 = v_1$ with $(w_2, w_3, \ldots, w_k) = (v_2, v_3, \ldots, v_\ell)$, we conclude $(w_1, w_2, \ldots, w_k) = (v_1, v_2, \ldots, v_\ell)$. Thus, the induction step is complete, and Statement $\mathcal{U}$ is proven. Hence, the uniqueness of the decomposition is proven, and we are done.

[1255] See Definition 1.6.2 for the definition of $\mathrm{Sh}_{k,\ell}$.

From (8.1.1), we have

$$\begin{aligned}
F_u F_v &= \sum_{w \in u \sqcup\!\sqcup v[k]} F_w \\
&= \sum_{w \in \mathrm{Sh}_{k,\ell}} F_{\left(c_{w(1)}, c_{w(2)}, \ldots, c_{w(k+\ell)}\right)} \qquad \text{(by (13.198.2))} \\
&= \underbrace{F_{\left(c_{\mathrm{id}(1)}, c_{\mathrm{id}(2)}, \ldots, c_{\mathrm{id}(k+\ell)}\right)}}_{\substack{=F_{u \square v} \\ \text{(since } \left(c_{\mathrm{id}(1)}, c_{\mathrm{id}(2)}, \ldots, c_{\mathrm{id}(k+\ell)}\right) \\ =(c_1, c_2, \ldots, c_{k+\ell}) = u \square v)}} + \sum_{\substack{w \in \mathrm{Sh}_{k,\ell}; \\ w \neq \mathrm{id}}} F_{\left(c_{w(1)}, c_{w(2)}, \ldots, c_{w(k+\ell)}\right)} \\
&\qquad \text{(here, we have split off the addend for } w = \mathrm{id} \text{ from the sum, since } \mathrm{id} \in \mathrm{Sh}_{k,\ell}) \\
&= F_{u \square v} + \sum_{\substack{w \in \mathrm{Sh}_{k,\ell}; \\ w \neq \mathrm{id}}} F_{\left(c_{w(1)}, c_{w(2)}, \ldots, c_{w(k+\ell)}\right)}. \qquad (13.198.3)
\end{aligned}$$

But it is easy to see that

$$\left(c_{w(1)}, c_{w(2)}, \ldots, c_{w(k+\ell)}\right) > u \square v \qquad \text{for every } w \in \mathrm{Sh}_{k,\ell} \text{ satisfying } w \neq \mathrm{id}. \qquad (13.198.4)$$

[*Proof of (13.198.4):* Let $w \in \mathrm{Sh}_{k,\ell}$ be such that $w \neq \mathrm{id}$. The map w is a permutation, hence bijective and thus injective. There exists some $i \in \{1, 2, \ldots, k+\ell\}$ such that $w(i) \neq i$ (since $w \neq \mathrm{id}$). Let j be the smallest such i. Thus, $w(j) \neq j$, but

$$\text{every } i \in \{1, 2, \ldots, k+\ell\} \text{ satisfying } i < j \text{ satisfies } w(i) = i. \qquad (13.198.5)$$

We have $w \in \mathrm{Sh}_{k,\ell}$, and therefore $w^{-1}(1) < w^{-1}(2) < \cdots < w^{-1}(k)$ and $w^{-1}(k+1) < w^{-1}(k+2) < \cdots < w^{-1}(k+\ell)$. Thus, the restriction of the map w^{-1} to the set $\{1, 2, \ldots, k\}$ and the restriction of the map w^{-1} to the set $\{k+1, k+2, \ldots, k+\ell\}$ are strictly increasing.

Let us first show that $j \leq k$. Indeed, assume the contrary. Then, $j > k$. Hence, $k < j$. Therefore, every $i \in \{1, 2, \ldots, k\}$ satisfies $i \leq k < j$ and thus $w(i) = i$ (by (13.198.5)). Thus, $w(\{1, 2, \ldots, k\}) = \{1, 2, \ldots, k\}$, so that $w^{-1}(\{1, 2, \ldots, k\}) = \{1, 2, \ldots, k\}$ (since w is bijective). Notice also that $j \in \{k+1, k+2, \ldots, k+\ell\}$ (since $j > k$). Now,

$$\begin{aligned}
w^{-1}\left(\underbrace{\{k+1, k+2, \ldots, k+\ell\}}_{=\{1,2,\ldots,k+\ell\} \setminus \{1,2,\ldots,k\}}\right) &= w^{-1}(\{1, 2, \ldots, k+\ell\} \setminus \{1, 2, \ldots, k\}) \\
&= \underbrace{w^{-1}(\{1, 2, \ldots, k+\ell\})}_{=\{1,2,\ldots,k+\ell\}} \setminus \underbrace{w^{-1}(\{1, 2, \ldots, k\})}_{=\{1,2,\ldots,k\}} \\
&\qquad \text{(since } w \text{ is bijective)} \\
&= \{1, 2, \ldots, k+\ell\} \setminus \{1, 2, \ldots, k\} = \{k+1, k+2, \ldots, k+\ell\}.
\end{aligned}$$

Therefore, w^{-1} restricts to a map from $\{k+1, k+2, \ldots, k+\ell\}$ to $\{k+1, k+2, \ldots, k+\ell\}$. This latter map must be strictly increasing (since the restriction of the map w^{-1} to the set $\{k+1, k+2, \ldots, k+\ell\}$ is strictly increasing), and therefore is the identity map (because the only strictly increasing map from $\{k+1, k+2, \ldots, k+\ell\}$ to $\{k+1, k+2, \ldots, k+\ell\}$ is the identity map). In other words, $w^{-1}(i) = \mathrm{id}(i) = i$ for every $i \in \{k+1, k+2, \ldots, k+\ell\}$. Applied to $i = j$, this yields $w^{-1}(j) = j$ (since we know that $j \in \{k+1, k+2, \ldots, k+\ell\}$), whence $w(j) = j$. But this contradicts $w(j) \neq j$. This contradiction proves that our assumption was wrong. Thus, $j \leq k$. Therefore,

$$\begin{aligned}
c_j &= u_j \qquad \text{(since } (c_1, c_2, \ldots, c_{k+\ell}) = (u_1, u_2, \ldots, u_k, p_1, p_2, \ldots, p_\ell)) \\
&= u(j) \leq k \qquad \text{(since } u \in \mathfrak{S}_k). \qquad (13.198.6)
\end{aligned}$$

If we had $w(j) < j$, then we would have $w(w(j)) = w(j)$ (by (13.198.5), applied to $i = w(j)$), which would lead to $w(j) = j$ (since w is injective), which would contradict $w(j) \neq j$. Hence, we cannot have $w(j) < j$. Thus, we have $w(j) \geq j$, so that $w(j) > j$ (since $w(j) \neq j$). In other words, $j < w(j)$.

Let us next prove that $w(j) > k$. Indeed, assume the contrary. Thus, $w(j) \leq k$. Thus, $w(j)$ and j are two elements of $\{1, 2, \ldots, k\}$ (because $w(j) \leq k$ and $j \leq k$) satisfying $j < w(j)$. Hence, $w^{-1}(j) < w^{-1}(w(j))$ (since $w^{-1}(1) < w^{-1}(2) < \cdots < w^{-1}(k)$). Hence, $w^{-1}(j) < w^{-1}(w(j)) = j$. Therefore, (13.198.5) (applied to $i = w^{-1}(j)$) yields $w\left(w^{-1}(j)\right) = w^{-1}(j)$, so that $w^{-1}(j) = w\left(w^{-1}(j)\right) = j$. This contradicts $w^{-1}(j) < j$. This contradiction proves that our assumption was wrong. Hence, $w(j) > k$ is proven.

Now, write v in the form $(v_1, v_2, \ldots, v_\ell)$. Then, $v[k] = (k + v_1, k + v_2, \ldots, k + v_\ell)$ (by the definition of $v[k]$). Since $w(j) > k$, we have

$$\begin{aligned} c_{w(j)} &= p_{w(j)-k} \qquad \left(\text{since } (c_1, c_2, \ldots, c_{k+\ell}) = (u_1, u_2, \ldots, u_k, p_1, p_2, \ldots, p_\ell)\right) \\ &= k + \underbrace{v_{w(j)-k}}_{>0} \qquad \left(\text{since } (p_1, p_2, \ldots, p_\ell) = v[k] = (k + v_1, k + v_2, \ldots, k + v_\ell)\right) \\ &> k \geq c_j \qquad \left(\text{by (13.198.6)}\right). \end{aligned}$$

So we have $c_{w(j)} > c_j$, but on the other hand, for every $i \in \{1, 2, \ldots, k + \ell\}$ satisfying $i < j$, we have $c_{w(i)} = c_i$ (because (13.198.5) yields $w(i) = i$). Thus,

$$\begin{aligned} \left(c_{w(1)}, c_{w(2)}, \ldots, c_{w(k+\ell)}\right) &> (c_1, c_2, \ldots, c_{k+\ell}) \qquad \text{(by the definition of lexicographic order)} \\ &= u \,\square\, v, \end{aligned}$$

and thus (13.198.4) is proven.]

Hence, (13.198.3) becomes

$$\begin{aligned} F_u F_v &= F_{u \square v} + \underbrace{\sum_{\substack{w \in \operatorname{Sh}_{k,\ell}; \\ w \neq \operatorname{id}}} F_{\left(c_{w(1)}, c_{w(2)}, \ldots, c_{w(k+\ell)}\right)}}_{\substack{=(\text{a sum of terms } F_t \text{ for } t \in \mathfrak{S} \text{ satisfying } t > u \square v) \\ (\text{by (13.198.4)})}} \\ &= F_{u \square v} + (\text{a sum of terms } F_t \text{ for } t \in \mathfrak{S} \text{ satisfying } t > u \,\square\, v). \end{aligned}$$

This proves Lemma 13.198.1. □

Corollary 13.198.2. *Every $n \in \mathbb{N}$ and $w \in \mathfrak{S}_n$ satisfy*

$$F_w^{\operatorname{conn}} = F_w + (\textit{a sum of terms } F_t \textit{ for } t \in \mathfrak{S}_n \textit{ satisfying } t > w).$$

Proof of Corollary 13.198.2. We shall first prove that every $k \in \mathbb{N}$ and every $(w_1, w_2, \ldots, w_k) \in \mathfrak{S}^k$ satisfy

(13.198.7)
$$F_{w_1} F_{w_2} \cdots F_{w_k} = F_{w_1 \square w_2 \square \cdots \square w_k} + (\text{a sum of terms } F_t \text{ for } t \in \mathfrak{S} \text{ satisfying } t > w_1 \,\square\, w_2 \,\square \cdots \square\, w_k).$$

Proof of (13.198.7): We will prove (13.198.7) by induction over k:

Induction base: For $k = 0$, the statement of (13.198.7) is obvious. Hence, the induction base is complete.

Induction step: Let $K \in \mathbb{N}$. Assume that (13.198.7) holds for $k = K$. We need to prove that (13.198.7) holds for $k = K + 1$.

Let $(w_1, w_2, \ldots, w_{K+1}) \in \mathfrak{S}^{K+1}$. By the induction hypothesis, we can apply (13.198.7) to $k = K$, and thus obtain

$$F_{w_1} F_{w_2} \cdots F_{w_K} = F_{w_1 \square w_2 \square \cdots \square w_K} + (\text{a sum of terms } F_t \text{ for } t \in \mathfrak{S} \text{ satisfying } t > w_1 \,\square\, w_2 \,\square \cdots \square\, w_K).$$

In other words, there exists a finite family $(t_i)_{i \in I}$ of elements t of $\mathfrak{S}$ satisfying $t > w_1 \,\square\, w_2 \,\square \cdots \square\, w_K$ such that

$$F_{w_1} F_{w_2} \cdots F_{w_K} = F_{w_1 \square w_2 \square \cdots \square w_K} + \sum_{i \in I} F_{t_i}.$$

Consider this family $(t_i)_{i \in I}$. We have

(13.198.8)
$$t_i \,\square\, w_{K+1} > w_1 \,\square\, w_2 \,\square \cdots \square\, w_{K+1} \qquad \text{for every } i \in I.$$

[1256] Now,

$$\begin{aligned}
&F_{w_1} F_{w_2} \cdots F_{w_{K+1}} \\
&= \underbrace{\left(F_{w_1} F_{w_2} \cdots F_{w_K}\right)}_{= F_{w_1 \square w_2 \square \cdots \square w_K} + \sum_{i \in I} F_{t_i}} F_{w_{K+1}} \\
&= \left(F_{w_1 \square w_2 \square \cdots \square w_K} + \sum_{i \in I} F_{t_i} \right) F_{w_{K+1}} \\
&= \underbrace{F_{w_1 \square w_2 \square \cdots \square w_K} F_{w_{K+1}}}_{\substack{= F_{(w_1 \square w_2 \square \cdots \square w_K) \square w_{K+1}} + (\text{a sum of terms } F_t \text{ for } t \in \mathfrak{S} \text{ satisfying } t > (w_1 \square w_2 \square \cdots \square w_K) \square w_{K+1}) \\ (\text{by Lemma 13.198.1, applied to } u = w_1 \square w_2 \square \cdots \square w_K \text{ and } v = w_{K+1})}} \\
&\qquad + \sum_{i \in I} \underbrace{F_{t_i} F_{w_{K+1}}}_{\substack{= F_{t_i \square w_{K+1}} + (\text{a sum of terms } F_t \text{ for } t \in \mathfrak{S} \text{ satisfying } t > t_i \square w_{K+1}) \\ (\text{by Lemma 13.198.1, applied to } u = t_i \text{ and } v = w_{K+1})}} \\
&= F_{(w_1 \square w_2 \square \cdots \square w_K) \square w_{K+1}} + \left(\text{a sum of terms } F_t \text{ for } t \in \mathfrak{S} \text{ satisfying } t > (w_1 \square w_2 \square \cdots \square w_K) \square w_{K+1}\right) \\
&\qquad + \sum_{i \in I} \left(F_{t_i \square w_{K+1}} + \left(\text{a sum of terms } F_t \text{ for } t \in \mathfrak{S} \text{ satisfying } t > t_i \square w_{K+1}\right) \right) \\
&= F_{w_1 \square w_2 \square \cdots \square w_{K+1}} + \left(\text{a sum of terms } F_t \text{ for } t \in \mathfrak{S} \text{ satisfying } t > w_1 \square w_2 \square \cdots \square w_{K+1}\right) \\
&\qquad + \sum_{i \in I} \underbrace{\left(F_{t_i \square w_{K+1}} + \left(\text{a sum of terms } F_t \text{ for } t \in \mathfrak{S} \text{ satisfying } t > t_i \square w_{K+1}\right) \right)}_{= (\text{a sum of terms } F_t \text{ for } t \in \mathfrak{S} \text{ satisfying } t \geq t_i \square w_{K+1})} \\
&\qquad \left(\text{since } \left(w_1 \square w_2 \square \cdots \square w_K\right) \square w_{K+1} = w_1 \square w_2 \square \cdots \square w_{K+1}\right) \\
&= F_{w_1 \square w_2 \square \cdots \square w_{K+1}} + \left(\text{a sum of terms } F_t \text{ for } t \in \mathfrak{S} \text{ satisfying } t > w_1 \square w_2 \square \cdots \square w_{K+1}\right) \\
&\qquad + \sum_{i \in I} \underbrace{\left(\text{a sum of terms } F_t \text{ for } t \in \mathfrak{S} \text{ satisfying } t \geq t_i \square w_{K+1}\right)}_{\substack{= (\text{a sum of terms } F_t \text{ for } t \in \mathfrak{S} \text{ satisfying } t > w_1 \square w_2 \square \cdots \square w_{K+1}) \\ (\text{since every } t \in \mathfrak{S} \text{ satisfying } t \geq t_i \square w_{K+1} \text{ also satisfies} \\ t \geq t_i \square w_{K+1} > w_1 \square w_2 \square \cdots \square w_{K+1} \text{ (by (13.198.8)))}}} \\
&= F_{w_1 \square w_2 \square \cdots \square w_{K+1}} + \left(\text{a sum of terms } F_t \text{ for } t \in \mathfrak{S} \text{ satisfying } t > w_1 \square w_2 \square \cdots \square w_{K+1}\right) \\
&\qquad + \sum_{i \in I} \left(\text{a sum of terms } F_t \text{ for } t \in \mathfrak{S} \text{ satisfying } t > w_1 \square w_2 \square \cdots \square w_{K+1}\right) \\
&= F_{w_1 \square w_2 \square \cdots \square w_{K+1}} + \left(\text{a sum of terms } F_t \text{ for } t \in \mathfrak{S} \text{ satisfying } t > w_1 \square w_2 \square \cdots \square w_{K+1}\right).
\end{aligned}$$

In other words, (13.198.7) holds for $k = K+1$. This completes the induction step. Hence, (13.198.7) is proven by induction.

Now, let $n \in \mathbb{N}$ and $w \in \mathfrak{S}_n$. Let $(w_1, w_2, \ldots, w_k)$ be the connected decomposition of w. Then, $F_w^{\text{conn}} = F_{w_1} F_{w_2} \cdots F_{w_k}$ (by the definition of F_w^{conn}) and $w = w_1 \square w_2 \square \cdots \square w_k$ (by the definition of a connected decomposition). Now,

$$\begin{aligned}
F_w^{\text{conn}} &= F_{w_1} F_{w_2} \cdots F_{w_k} \\
&= F_{w_1 \square w_2 \square \cdots \square w_k} + \left(\text{a sum of terms } F_t \text{ for } t \in \mathfrak{S} \text{ satisfying } t > w_1 \square w_2 \square \cdots \square w_k\right) \\
&\qquad \left(\text{by (13.198.7)}\right) \\
&= F_w + \left(\text{a sum of terms } F_t \text{ for } t \in \mathfrak{S} \text{ satisfying } t > w\right) \qquad \left(\text{since } w_1 \square w_2 \square \cdots \square w_k = w\right).
\end{aligned}$$

Since every $t \in \mathfrak{S}$ satisfying $t > w$ must belong to $\mathfrak{S}_n$ [1257], this rewrites as

$$F_w^{\text{conn}} = F_w + \left(\text{a sum of terms } F_t \text{ for } t \in \mathfrak{S}_n \text{ satisfying } t > w\right).$$

[1256] *Proof of (13.198.8):* Let $i \in I$. Then, t_i is an element t of $\mathfrak{S}$ satisfying $t > w_1 \square w_2 \square \cdots \square w_K$. Hence, $t_i > w_1 \square w_2 \square \cdots \square w_K$. Thus, (13.198.1) (applied to $\alpha = t_i$, $\beta = w_1 \square w_2 \square \cdots \square w_K$ and $\gamma = w_{K+1}$) yields $t_i \square w_{K+1} > (w_1 \square w_2 \square \cdots \square w_K) \square w_{K+1} = w_1 \square w_2 \square \cdots \square w_{K+1}$, qed.

[1257] *Proof.* Let $t \in \mathfrak{S}$ be such that $t > w$. Recall that $w \in \mathfrak{S}_n$. Therefore, if we had $t \notin \mathfrak{S}_n$, then t and w would be incomparable in the poset $\mathfrak{S}$ (because of the construction of the poset $\mathfrak{S}$), which would contradict the fact that $t > w$. Hence, we cannot have $t \notin \mathfrak{S}_n$. Thus, $t \in \mathfrak{S}_n$, qed.

This proves Corollary 13.198.2. □

Now, let us fix $n \in \mathbb{N}$. The family $(F_w)_{w \in \mathfrak{S}_n}$ is a basis of the $\mathbf{k}$-module FQSym_n. We regard the set $\mathfrak{S}_n$ as a poset whose smaller relation is the relation $>$ inherited from $\mathfrak{S}$ (yes, you are reading it right: the order on $\mathfrak{S}_n$ is opposite to that on $\mathfrak{S}$). Then, Corollary 13.198.2 shows that the family $(F_w^{\operatorname{conn}})_{w \in \mathfrak{S}_n}$ expands unitriangularly[1258] in the family $(F_w)_{w \in \mathfrak{S}_n}$ (by Remark 11.1.17(c)). Thus, the family $(F_w^{\operatorname{conn}})_{w \in \mathfrak{S}_n}$ expands invertibly triangularly in the family $(F_w)_{w \in \mathfrak{S}_n}$. Consequently, Corollary 11.1.19(e) (applied to FQSym_n, $\mathfrak{S}_n$, $(F_w^{\operatorname{conn}})_{w \in \mathfrak{S}_n}$ and $(F_w)_{w \in \mathfrak{S}_n}$ instead of M, S, $(e_s)_{s \in S}$ and $(f_s)_{s \in S}$) shows that the family $(F_w^{\operatorname{conn}})_{w \in \mathfrak{S}_n}$ is a basis of the $\mathbf{k}$-module FQSym_n if and only if the family $(F_w)_{w \in \mathfrak{S}_n}$ is a basis of the $\mathbf{k}$-module FQSym_n. Hence, the family $(F_w^{\operatorname{conn}})_{w \in \mathfrak{S}_n}$ is a basis of the $\mathbf{k}$-module FQSym_n (since the family $(F_w)_{w \in \mathfrak{S}_n}$ is a basis of the $\mathbf{k}$-module FQSym_n).

Now, let us forget that we fixed n. We thus have proven that the family $(F_w^{\operatorname{conn}})_{w \in \mathfrak{S}_n}$ is a basis of the $\mathbf{k}$-module FQSym_n for every $n \in \mathbb{N}$. Hence, the family $(F_w^{\operatorname{conn}})_{w \in \mathfrak{S}}$ (being the disjoint union of the families $(F_w^{\operatorname{conn}})_{w \in \mathfrak{S}_n}$ for all $n \in \mathbb{N}$) is a basis of the $\mathbf{k}$-module $\bigoplus_{n \in \mathbb{N}} \operatorname{FQSym}_n = \operatorname{FQSym}$.

Now, it is easy to see that the family $(F_{w_1} F_{w_2} \cdots F_{w_k})_{k \in \mathbb{N};\ (w_1, w_2, \ldots, w_k) \in \mathfrak{CS}^k}$ is a reindexing of the family $(F_w^{\operatorname{conn}})_{w \in \mathfrak{S}}$ [1259]. Thus, the family $(F_{w_1} F_{w_2} \cdots F_{w_k})_{k \in \mathbb{N};\ (w_1, w_2, \ldots, w_k) \in \mathfrak{CS}^k}$ is a basis of the $\mathbf{k}$-module FQSym (since the family $(F_w^{\operatorname{conn}})_{w \in \mathfrak{S}}$ is a basis of the $\mathbf{k}$-module FQSym). In other words, FQSym is a free (noncommutative) $\mathbf{k}$-algebra with generators $(F_w)_{w \in \mathfrak{CS}}$. This solves Exercise 8.1.10.

13.199. **Solution to Exercise 11.1.11.** *Solution to Exercise 11.1.11.* Let us first agree on a convention: Whenever S is a poset, we let $\leq$ denote the smaller-or-equal relation of the poset S.

Before we prove Proposition 11.1.10, let us make a definition:

Definition 13.199.1. Let S be a poset.

(a) Let T_S denote the set of all triangular $S \times S$-matrices. Clearly, $\operatorname{T}_S \subset \mathbf{k}^{S \times S}$.
(b) Let IT_S denote the set of all invertibly triangular $S \times S$-matrices.
(c) Let UT_S denote the set of all unitriangular $S \times S$-matrices.

Now, we shall state several lemmas (most of them completely trivial, and stated merely for the purpose of easier reference).

Lemma 13.199.2. *Let S and T be two finite sets. Let $A = (a_{s,t})_{(s,t) \in S \times T}$ be an $S \times T$-matrix. Let $B = (b_{s,t})_{(s,t) \in T \times S}$ be a $T \times S$-matrix. Then,*

$$AB = \left(\sum_{k \in T} a_{s,k} b_{k,t} \right)_{(s,t) \in S \times S} .$$

Proof of Lemma 13.199.2. Lemma 13.199.2 is just a restatement of the definition of AB. □

[1258] See Definition 11.1.16 for the meaning of these words.

[1259] *Proof.* For every $k \in \mathbb{N}$ and $(w_1, w_2, \ldots, w_k) \in \mathfrak{CS}^k$, the connected decomposition of the permutation $w_1 \square w_2 \square \cdots \square w_k$ is the k-tuple $(w_1, w_2, \ldots, w_k)$ (by the definition of a connected decomposition). Hence, for every $k \in \mathbb{N}$ and $(w_1, w_2, \ldots, w_k) \in \mathfrak{CS}^k$, we have

$$F^{\operatorname{conn}}_{w_1 \square w_2 \square \cdots \square w_k} = F_{w_1} F_{w_2} \cdots F_{w_k} \qquad (13.198.9)$$

(by the definition of $F^{\operatorname{conn}}_{w_1 \square w_2 \square \cdots \square w_k}$).

Now, recall that for every permutation $w \in \mathfrak{S}$, there is a unique way to write w in the form $w = w_1 \square w_2 \square \cdots \square w_k$ for some $k \in \mathbb{N}$ and some k-tuple $(w_1, w_2, \ldots, w_k) \in \mathfrak{CS}^k$ of connected permutations. In other words, the map

$$\bigsqcup_{k \in \mathbb{N}} \mathfrak{CS}^k \to \mathfrak{S},$$
$$(w_1, w_2, \ldots, w_k) \mapsto w_1 \square w_2 \square \cdots \square w_k$$

is a bijection. Hence, the family $\left(F^{\operatorname{conn}}_{w_1 \square w_2 \square \cdots \square w_k} \right)_{k \in \mathbb{N};\ (w_1, w_2, \ldots, w_k) \in \mathfrak{CS}^k}$ is a reindexing of the family $(F_w^{\operatorname{conn}})_{w \in \mathfrak{S}}$. Due to (13.198.9), this rewrites as follows: The family $(F_{w_1} F_{w_2} \cdots F_{w_k})_{k \in \mathbb{N};\ (w_1, w_2, \ldots, w_k) \in \mathfrak{CS}^k}$ is a reindexing of the family $(F_w^{\operatorname{conn}})_{w \in \mathfrak{S}}$. Qed.

Lemma 13.199.3. *Let S be a poset. Let $A \in \mathrm{T}_S$. Then, A is a triangular $S \times S$-matrix.*

Proof of Lemma 13.199.3. Lemma 13.199.3 follows from the definition of T_S. □

Lemma 13.199.4. *Let S be a poset. Let $A = (a_{s,t})_{(s,t)\in S\times S}$ be a triangular $S \times S$-matrix. Then, every $(s,t) \in S \times S$ which does not satisfy $t \leq s$ must satisfy $a_{s,t} = 0$.*

Proof of Lemma 13.199.4. Lemma 13.199.4 follows from the definition of "triangular". □

Lemma 13.199.5. *Let S be a poset. Let $A = (a_{s,t})_{(s,t)\in S\times S}$ be an $S \times S$-matrix. Assume that every $(s,t) \in S \times S$ which does not satisfy $t \leq s$ must satisfy $a_{s,t} = 0$. Then, $A \in \mathrm{T}_S$.*

Proof of Lemma 13.199.5. Lemma 13.199.5 follows from the definitions of T_S and of "triangular". □

Lemma 13.199.6. *Let S be a poset. Let $A \in \mathrm{IT}_S$. Then, A is an invertibly triangular $S \times S$-matrix.*

Proof of Lemma 13.199.6. Lemma 13.199.6 follows from the definition of IT_S. □

Lemma 13.199.7. *Let S be a poset. Let A be an invertibly triangular $S \times S$-matrix. Then, $A \in \mathrm{T}_S$.*

Proof of Lemma 13.199.7. Lemma 13.199.7 follows from the definition of "invertibly triangular". □

Lemma 13.199.8. *Let S be a poset. Let $A = (a_{s,t})_{(s,t)\in S\times S}$ be an invertibly triangular $S \times S$-matrix. Then, for every $s \in S$, the element $a_{s,s}$ of $\mathbf{k}$ is invertible.*

Proof of Lemma 13.199.8. Lemma 13.199.8 follows from the definition of "invertibly triangular". □

Lemma 13.199.9. *Let S be a poset. Let $A = (a_{s,t})_{(s,t)\in S\times S}$ be an $S \times S$-matrix. Assume that $A \in \mathrm{T}_S$. Assume that, for every $s \in S$, the element $a_{s,s}$ of $\mathbf{k}$ is invertible. Then, $A \in \mathrm{IT}_S$.*

Proof of Lemma 13.199.9. Lemma 13.199.9 follows from the definitions of T_S, of IT_S and of "invertibly triangular". □

Lemma 13.199.10. *Let S be a poset. We have $\mathrm{IT}_S \subset \mathrm{T}_S$.*

Proof of Lemma 13.199.10. Lemma 13.199.10 just says that every invertibly triangular $S \times S$-matrix is triangular; this follows from the definition of "invertibly triangular". □

Lemma 13.199.11. *Let S be a finite poset. Let $A = (a_{s,t})_{(s,t)\in S\times S} \in \mathrm{T}_S$ and $B = (b_{s,t})_{(s,t)\in S\times S} \in \mathrm{T}_S$. Then, for every $s \in S$, we have*

$$\sum_{k\in S} a_{s,k} b_{k,s} = a_{s,s} b_{s,s}.$$

Proof of Lemma 13.199.11. We have $A \in \mathrm{T}_S$. Hence, Lemma 13.199.3 shows that A is a triangular $S \times S$-matrix. Lemma 13.199.4 thus shows that

(13.199.1) every $(s,t) \in S \times S$ which does not satisfy $t \leq s$ must satisfy $a_{s,t} = 0$.

The same argument (applied to B and $b_{s,t}$ instead of A and $a_{s,t}$) shows that

(13.199.2) every $(s,t) \in S \times S$ which does not satisfy $t \leq s$ must satisfy $b_{s,t} = 0$.

Let $s \in S$. Every $k \in S$ satisfying $k \neq s$ must satisfy

(13.199.3) $$a_{s,k} b_{k,s} = 0$$

[1260]. Now, for every $s \in S$, we have

$$\sum_{k\in S} a_{s,k} b_{k,s} = a_{s,s} b_{s,s} + \sum_{\substack{k\in S;\\ k\neq s}} \underbrace{a_{s,k} b_{k,s}}_{\substack{=0\\ \text{(by (13.199.3))}}}$$

(here, we have split off the addend for $k = s$ from the sum)

$$= a_{s,s} b_{s,s} + \underbrace{\sum_{\substack{k\in S;\\ k\neq s}} 0}_{=0} = a_{s,s} b_{s,s}.$$

This proves Lemma 13.199.11. □

Lemma 13.199.12. *Let S be a poset. Let $A \in \mathrm{UT}_S$. Then, A is a unitriangular $S \times S$-matrix.*

Proof of Lemma 13.199.12. Lemma 13.199.12 follows from the definition of UT_S. □

Lemma 13.199.13. *Let S be a poset. Let A be a unitriangular $S \times S$-matrix. Then, $A \in \mathrm{T}_S$.*

Proof of Lemma 13.199.13. Lemma 13.199.13 follows from the definitions of T_S and of "unitriangular". □

Lemma 13.199.14. *Let S be a poset. Let $A = (a_{s,t})_{(s,t)\in S\times S}$ be a unitriangular $S \times S$-matrix. Then, for every $s \in S$, we have $a_{s,s} = 1$.*

Proof of Lemma 13.199.14. Lemma 13.199.14 follows from the definition of "unitriangular". □

Lemma 13.199.15. *Let S be a poset. Let $A = (a_{s,t})_{(s,t)\in S\times S}$ be an $S \times S$-matrix. Assume that $A \in \mathrm{T}_S$. Assume that, for every $s \in S$, we have $a_{s,s} = 1$. Then, $A \in \mathrm{UT}_S$.*

Proof of Lemma 13.199.15. Lemma 13.199.15 follows from the definitions of T_S, of UT_S and of "unitriangular". □

Lemma 13.199.16. *Let S be a poset. We have $\mathrm{UT}_S \subset \mathrm{T}_S$.*

Proof of Lemma 13.199.16. Lemma 13.199.16 just says that every unitriangular $S \times S$-matrix is triangular; this follows from the definition of "unitriangular". □

Lemma 13.199.17. *We have $\mathrm{UT}_S \subset \mathrm{IT}_S$.*

Proof of Lemma 13.199.17. Lemma 13.199.17 just says that every unitriangular $S \times S$-matrix is invertibly triangular. In order to prove it, we only need to compare the definitions of "unitriangular" and of "invertibly triangular", and observe that the former definition makes a stronger requirement than the latter (indeed, if $a_{s,s} = 1$, then $a_{s,s}$ is invertible). □

Proof of Proposition 11.1.10. We begin with some preparations.

For any $(s,t) \in S \times S$, we define a subset $[t,s]$ of S by

$$[t,s] = \{q \in S \mid t \leq q \leq s\}.$$

This subset $[t,s]$ is called the *interval of S bounded by t and s*. (Notice that it can be an empty set, since we have not required that $t \leq s$.) The following facts hold:

[1260] *Proof of (13.199.3):* Let $k \in S$ be such that $k \neq s$. We must prove (13.199.3).

We are in one of the following two cases:

Case 1: We have $s \leq k$.

Case 2: We do not have $s \leq k$.

Let us first consider Case 1. In this case, we have $s \leq k$. If we had $k \leq s$, then we would have $k = s$ (since $k \leq s \leq k$); but this would contradict $k \neq s$. Hence, we cannot have $k \leq s$. Thus, (13.199.1) (applied to (s,k) instead of (s,t)) shows that $a_{s,k} = 0$. Thus, $\underbrace{a_{s,k}}_{=0} b_{k,s} = 0$. Hence, (13.199.3) is proven in Case 1.

Let us now consider Case 2. In this case, we do not have $s \leq k$. Hence, (13.199.2) (applied to (k,s) instead of (s,t)) shows that $b_{k,s} = 0$. Thus, $a_{s,k} \underbrace{b_{k,s}}_{=0} = 0$. Hence, (13.199.3) is proven in Case 2.

Now, we have proven (13.199.3) in each of the two Cases 1 and 2. Hence, (13.199.3) always holds. Qed.

- For any $(s,t) \in S \times S$, the set $[t,s]$ is finite (since it is a subset of the finite set S). Hence, for any $(s,t) \in S \times S$, the cardinality $|[t,s]|$ is a well-defined nonnegative integer.
- If s, t and u are three elements of S such that $s \leq t < u$, then

$$[s,t] \text{ is a proper subset of } [s,u]. \tag{13.199.4}$$

(Indeed, it is straightforward to show that $[s,t]$ is a subset of $[s,u]$. To prove that this subset is proper, it suffices to observe that u belongs to $[s,u]$ but not to $[s,t]$.)
- If s, t and u are three elements of S such that $s < t \leq u$, then

$$[t,u] \text{ is a proper subset of } [s,u]. \tag{13.199.5}$$

(Indeed, it is straightforward to show that $[t,u]$ is a subset of $[s,u]$. To prove that this subset is proper, it suffices to observe that s belongs to $[s,u]$ but not to $[t,u]$.)

Let us now prove Proposition 11.1.10.

(a) Let $0_{S\times S} \in \mathbf{k}^{S\times S}$ be the matrix $(0)_{(s,t)\in S\times S}$. This matrix $0_{S\times S}$ is the zero of the $\mathbf{k}$-algebra $\mathbf{k}^{S\times S}$.

We shall now prove the following five claims:

Claim A1: We have $0_{S\times S} \in \mathrm{T}_S$.

Claim A2: For every $A \in \mathrm{T}_S$ and $B \in \mathrm{T}_S$, we have $A + B \in \mathrm{T}_S$.

Claim A3: For every $A \in \mathrm{T}_S$ and $u \in \mathbf{k}$, we have $uA \in \mathrm{T}_S$.

Claim A4: We have $I_S \in \mathrm{T}_S$.

Claim A5: For every $A \in \mathrm{T}_S$ and $B \in \mathrm{T}_S$, we have $AB \in \mathrm{T}_S$.

Proof of Claim A1: The definition of $0_{S\times S}$ yields $0_{S\times S} = (0)_{(s,t)\in S\times S}$. Clearly, every $(s,t) \in S \times S$ which does not satisfy $t \leq s$ must satisfy $0 = 0$. Thus, Lemma 13.199.5 (applied to $0_{S\times S}$ and 0 instead of A and $a_{s,t}$) shows that $0_{S\times S} \in \mathrm{T}_S$. This proves Claim A1.

Proof of Claim A2: Let $A \in \mathrm{T}_S$ and $B \in \mathrm{T}_S$. Write the $S \times S$-matrix A in the form $A = (a_{s,t})_{(s,t)\in S\times S}$. Write the $S \times S$-matrix B in the form $B = (b_{s,t})_{(s,t)\in S\times S}$.

Lemma 13.199.3 shows that A is a triangular $S \times S$-matrix (since $A \in \mathrm{T}_S$). Lemma 13.199.4 shows that

$$\text{every } (s,t) \in S \times S \text{ which does not satisfy } t \leq s \text{ must satisfy } a_{s,t} = 0. \tag{13.199.6}$$

The same argument (applied to B and $b_{s,t}$ instead of A and $a_{s,t}$) shows that

$$\text{every } (s,t) \in S \times S \text{ which does not satisfy } t \leq s \text{ must satisfy } b_{s,t} = 0. \tag{13.199.7}$$

Adding the equalities $A = (a_{s,t})_{(s,t)\in S\times S}$ and $B = (b_{s,t})_{(s,t)\in S\times S}$, we obtain

$$A + B = (a_{s,t})_{(s,t)\in S\times S} + (b_{s,t})_{(s,t)\in S\times S} = (a_{s,t} + b_{s,t})_{(s,t)\in S\times S}$$

(by the definition of the sum of two $S \times S$-matrices). But every $(s,t) \in S \times S$ which does not satisfy $t \leq s$ must satisfy $\underbrace{a_{s,t}}_{\substack{=0 \\ \text{(by (13.199.6))}}} + \underbrace{b_{s,t}}_{\substack{=0 \\ \text{(by (13.199.7))}}} = 0+0 = 0$. Hence, Lemma 13.199.5 (applied to $A+B$ and $a_{s,t}+b_{s,t}$ instead of A and $a_{s,t}$) shows that $A + B \in \mathrm{T}_S$ (since $A + B = (a_{s,t} + b_{s,t})_{(s,t)\in S\times S}$). This proves Claim A2.

Proof of Claim A3: The proof of Claim A3 is similar to our proof of Claim A2 above, and is left to the reader.

Proof of Claim A4: The definition of I_S yields $I_S = (\delta_{s,t})_{(s,t)\in S\times S}$. But every $(s,t) \in S \times S$ which does not satisfy $t \leq s$ must satisfy $\delta_{s,t} = 0$ [1261]. Hence, Lemma 13.199.5 (applied to I_S and $\delta_{s,t}$ instead of A and $a_{s,t}$) shows that $I_S \in \mathrm{T}_S$. This proves Claim A4.

Proof of Claim A5: Let $A \in \mathrm{T}_S$ and $B \in \mathrm{T}_S$.

As in the proof of Claim A2, we can see that the statements (13.199.6) and (13.199.7) hold.

Lemma 13.199.2 (applied to $T = S$) yields

$$AB = \left(\sum_{k\in S} a_{s,k} b_{k,t} \right)_{(s,t)\in S\times S}.$$

[1261] *Proof.* Let $(s,t) \in S \times S$ be such that we do not have $t \leq s$. We must prove that $\delta_{s,t} = 0$.

If we had $s = t$, then we would have $t = s \leq s$, which would contradict the fact that we do not have $t \leq s$. Hence, we cannot have $s = t$. Thus, $\delta_{s,t} = 0$, qed.

But every $(s,t) \in S \times S$ and every $k \in S$ which do not satisfy $t \leq s$ must satisfy

$$a_{s,k} b_{k,t} = 0 \tag{13.199.8}$$

[1262]. Thus, every $(s,t) \in S \times S$ which does not satisfy $t \leq s$ must satisfy

$$\sum_{k \in S} \underbrace{a_{s,k} b_{k,t}}_{\substack{=0 \\ \text{(by (13.199.8))}}} = \sum_{k \in S} 0 = 0.$$

Hence, Lemma 13.199.5 (applied to AB and $\sum_{k \in S} a_{s,k} b_{k,t}$ instead of A and $a_{s,t}$) shows that $AB \in \mathrm{T}_S$ (since $AB = \left(\sum_{k \in S} a_{s,k} b_{k,t}\right)_{(s,t) \in S \times S}$). This proves Claim A5.

Recall that T_S is a subset of $\mathbf{k}^{S \times S}$. This subset T_S is a $\mathbf{k}$-submodule of $\mathbf{k}^{S \times S}$ (by Claim A1, Claim A2 and Claim A3), and therefore is a $\mathbf{k}$-subalgebra of $\mathbf{k}^{S \times S}$ (by Claim A4 and Claim A5). In other words, the set of all triangular $S \times S$-matrices is a $\mathbf{k}$-subalgebra of $\mathbf{k}^{S \times S}$ (since T_S is the set of all triangular $S \times S$-matrices). This proves Proposition 11.1.10(a).

(b) We shall first prove the following claims:

Claim B1: We have $I_S \in \mathrm{IT}_S$.

Claim B2: For every $A \in \mathrm{IT}_S$ and $B \in \mathrm{IT}_S$, we have $AB \in \mathrm{IT}_S$.

Claim B3: Let $A \in \mathrm{IT}_S$. Then, A is invertible (as an element of the ring $\mathbf{k}^{S \times S}$), and its inverse A^{-1} belongs to IT_S.

Proof of Claim B1: The definition of I_S yields $I_S = (\delta_{s,t})_{(s,t) \in S \times S}$. Claim A4 in our proof of Proposition 11.1.10(a) yields $I_S \in \mathrm{T}_S$. For every $s \in S$, we have $\delta_{s,s} = 1$. Hence, for every $s \in S$, the element $\delta_{s,s}$ of $\mathbf{k}$ is invertible. Thus, Lemma 13.199.9 (applied to I_S and $\delta_{s,t}$ instead of A and $a_{s,t}$) yields $I_S \in \mathrm{IT}_S$. This proves Claim B1.

Proof of Claim B2: Let $A \in \mathrm{IT}_S$ and $B \in \mathrm{IT}_S$.

We know that A is an invertibly triangular $S \times S$-matrix (by Lemma 13.199.6). Hence, $A \in \mathrm{T}_S$ (by Lemma 13.199.7). Hence, Lemma 13.199.3 shows that A is a triangular $S \times S$-matrix. Write the $S \times S$-matrix A in the form $A = (a_{s,t})_{(s,t) \in S \times S}$. Lemma 13.199.8 yields that

$$\text{for every } s \in S, \text{ the element } a_{s,s} \text{ of } \mathbf{k} \text{ is invertible.} \tag{13.199.9}$$

We know that B is an invertibly triangular $S \times S$-matrix (by Lemma 13.199.6, applied to B instead of A). Hence, $B \in \mathrm{T}_S$ (by Lemma 13.199.7, applied to B instead of A). Hence, Lemma 13.199.3 (applied to B instead of A) shows that B is a triangular $S \times S$-matrix. Write the $S \times S$-matrix B in the form $B = (b_{s,t})_{(s,t) \in S \times S}$. Lemma 13.199.8 (applied to B and $b_{s,t}$ instead of A and $a_{s,t}$) yields that

$$\text{for every } s \in S, \text{ the element } b_{s,s} \text{ of } \mathbf{k} \text{ is invertible.} \tag{13.199.10}$$

From $A \in \mathrm{T}_S$ and $B \in \mathrm{T}_S$, we obtain $AB \in \mathrm{T}_S$ (by Claim A5 in our proof of Proposition 11.1.10(a)).

Lemma 13.199.2 (applied to $T = S$) yields

$$AB = \left(\sum_{k \in S} a_{s,k} b_{k,t}\right)_{(s,t) \in S \times S}.$$

[1262] *Proof of (13.199.8):* Let $(s,t) \in S \times S$ and $k \in S$ be such that we do not have $t \leq s$. We must prove the equality (13.199.8).

We are in one of the following two cases:

Case 1: We have $t \leq k$.

Case 2: We do not have $t \leq k$.

Let us first consider Case 1. In this case, we have $t \leq k$. If we had $k \leq s$, then we would have $t \leq k \leq s$; but this would contradict the fact that we do not have $t \leq s$. Hence, we cannot have $k \leq s$. Thus, (13.199.6) (applied to (s,k) instead of (s,t)) shows that $a_{s,k} = 0$. Thus, $\underbrace{a_{s,k}}_{=0} b_{k,t} = 0$. Hence, (13.199.8) is proven in Case 1.

Let us now consider Case 2. In this case, we do not have $t \leq k$. Hence, (13.199.7) (applied to (k,t) instead of (s,t)) shows that $b_{k,t} = 0$. Thus, $a_{s,k} \underbrace{b_{k,t}}_{=0} = 0$. Hence, (13.199.8) is proven in Case 2.

Now, we have proven (13.199.8) in each of the two Cases 1 and 2. This shows that (13.199.8) always holds. Qed.

Lemma 13.199.11 shows that, for every $s \in S$, we have $\sum_{k\in S} a_{s,k}b_{k,s} = a_{s,s}b_{s,s}$. Hence, for every $s \in S$, the element $\sum_{k\in S} a_{s,k}b_{k,s}$ of $\mathbf{k}$ is invertible[1263]. Thus, Lemma 13.199.9 (applied to AB and $\sum_{k\in S} a_{s,k}b_{k,t}$ instead of A and $a_{s,t}$) shows that $AB \in \mathrm{IT}_S$ (since $AB = \left(\sum_{k\in S} a_{s,k}b_{k,t}\right)_{(s,t)\in S\times S}$ and $AB \in \mathrm{T}_S$). This proves Claim B2.

Proof of Claim B3: We know that A is an invertibly triangular $S\times S$-matrix (by Lemma 13.199.6). Hence, $A \in \mathrm{T}_S$ (by Lemma 13.199.7). Hence, Lemma 13.199.3 shows that A is a triangular $S \times S$-matrix. Write the $S \times S$-matrix A in the form $A = (a_{s,t})_{(s,t)\in S\times S}$. Lemma 13.199.4 shows that

$$\text{every } (s,t) \in S \times S \text{ which does not satisfy } t \leq s \text{ must satisfy } a_{s,t} = 0. \tag{13.199.11}$$

Lemma 13.199.8 yields that

$$\text{for every } s \in S, \text{ the element } a_{s,s} \text{ of } \mathbf{k} \text{ is invertible.} \tag{13.199.12}$$

We shall now define an element $b_{s,t}$ for each $(s,t) \in S\times S$. In fact, we will define these elements recursively, by strong induction on $|[t,s]|$ [1264]: Let $N \in \mathbb{N}$. Assume that

$$\text{an element } b_{s,t} \in \mathbf{k} \text{ is already defined for each } (s,t) \in S \times S \text{ satisfying } |[t,s]| < N. \tag{13.199.13}$$

We shall now define an element $b_{s,t} \in \mathbf{k}$ for each $(s,t) \in S \times S$ satisfying $|[t,s]| = N$.

Indeed, let $(s,t) \in S \times S$ be such that $|[t,s]| = N$. We must define an element $b_{s,t} \in \mathbf{k}$.

For every $u \in S$ satisfying $t < u \leq s$, the element $b_{s,u}$ is already defined[1265]. Thus, the sum $\sum\limits_{\substack{u\in S;\\ t<u\leq s}} b_{s,u}a_{u,t} \in \mathbf{k}$ is well-defined. Furthermore, the element $a_{t,t}$ of $\mathbf{k}$ is invertible (by (13.199.12), applied to t instead of s). Hence, the element $(a_{t,t})^{-1}$ of $\mathbf{k}$ is well-defined. Now, we set

$$b_{s,t} = (a_{t,t})^{-1}\left(\delta_{s,t} - \sum_{\substack{u\in S;\\ t<u\leq s}} b_{s,u}a_{u,t}\right) \tag{13.199.14}$$

(this makes sense since both $(a_{t,t})^{-1}$ and $\sum\limits_{\substack{u\in S;\\ t<u\leq s}} b_{s,u}a_{u,t}$ are well-defined). Thus, we have defined an element $b_{s,t} \in \mathbf{k}$. This completes the recursive definition of $b_{s,t}$.

We have now defined an element $b_{s,t} \in \mathbf{k}$ for each $(s,t) \in S \times S$. In other words, we have defined a family $(b_{s,t})_{(s,t)\in S\times S} \in \mathbf{k}^{S\times S}$. This family is clearly an $S \times S$-matrix. Denote this $S \times S$-matrix by B. Thus, $B = (b_{s,t})_{(s,t)\in S\times S} \in \mathbf{k}^{S\times S}$. We shall now show (in several steps) that $BA = I_S$ and that $B \in \mathrm{IT}_S$.

First, we notice that

$$\text{every } (s,t) \in S \times S \text{ which does not satisfy } t \leq s \text{ must satisfy } b_{s,t} = 0 \tag{13.199.15}$$

[1266]. Hence, Lemma 13.199.5 (applied to B and $b_{s,t}$ instead of A and $a_{s,t}$) yields $B \in \mathrm{T}_S$.

[1263] *Proof.* Let $s \in S$. Then, the element $a_{s,s}$ of $\mathbf{k}$ is invertible (by (13.199.9)). The element $b_{s,s}$ of $\mathbf{k}$ is invertible as well (by (13.199.10)). Thus, the product $a_{s,s}b_{s,s}$ of these two elements is also invertible (since the product of two invertible elements is always invertible). In other words, $\sum_{k\in S} a_{s,k}b_{k,s}$ is invertible (since $\sum_{k\in S} a_{s,k}b_{k,s} = a_{s,s}b_{s,s}$). Qed.

[1264] Here, we are using the fact that $|[t,s]|$ is a nonnegative integer for every $(s,t) \in S \times S$.

[1265] *Proof.* Let $u \in S$ be such that $t < u \leq s$. We have to show that the element $b_{s,u}$ is already defined.

From (13.199.5) (applied to t, u and s instead of s, t and u), we conclude that $[u,s]$ is a proper subset of $[t,s]$. Hence, $|[u,s]| < |[t,s]|$ (since $[t,s]$ is a finite set). Thus, $|[u,s]| < |[t,s]| = N$. Therefore, (13.199.13) (applied to (s,u) instead of (s,t)) shows that an element $b_{s,u}$ is already defined.

[1266] *Proof of (13.199.15):* Let $(s,t) \in S \times S$ be such that we do not have $t \leq s$. We must prove that $b_{s,t} = 0$.

If we had $s = t$, then we would have $t = s \leq s$, which would contradict the fact that we do not have $t \leq s$. Hence, we cannot have $s = t$. Thus, $\delta_{s,t} = 0$.

If there was an $u \in S$ satisfying $t < u \leq s$, then we would have $t \leq s$, which would contradict the fact that we do not have $t \leq s$. Hence, there is no $u \in S$ satisfying $t < u \leq s$. Thus, the sum $\sum\limits_{\substack{u\in S;\\ t<u\leq s}} b_{s,u}a_{u,t}$ is empty. Hence, $\sum\limits_{\substack{u\in S;\\ t<u\leq s}} b_{s,u}a_{u,t} = (\text{empty sum}) = 0$.

For every $(s,t) \in S \times S$, we have

$$\sum_{\substack{k\in S;\\ t\leq k\leq s}} b_{s,k} a_{k,t} = \delta_{s,t} \tag{13.199.16}$$

[1267]. Thus, for every $(s,t) \in S \times S$, we have

$$\sum_{k\in S} b_{s,k} a_{k,t} = \delta_{s,t} \tag{13.199.17}$$

Now, the recursive definition of $b_{s,t}$ yields $b_{s,t} = (a_{t,t})^{-1} \underbrace{\left(\underbrace{\delta_{s,t}}_{=0} - \sum_{\substack{u\in S;\\ t<u\leq s}} b_{s,u} a_{u,t} \right)}_{=0} = (a_{t,t})^{-1} 0 = 0$. This proves (13.199.15).

[1267] *Proof of (13.199.16):* Let $(s,t) \in S \times S$. We must prove the equality (13.199.16).

We are in one of the following two cases:

Case 1: We have $t \leq s$.

Case 2: We do not have $t \leq s$.

Let us first consider Case 1. In this case, we have $t \leq s$. Thus, t is an element of S satisfying $t \leq t \leq s$. Hence, the sum $\sum_{\substack{u\in S;\\ t\leq u\leq s}} b_{s,u} a_{u,t}$ has an addend for $u = t$. Splitting off this addend, we obtain

$$\sum_{\substack{u\in S;\\ t\leq u\leq s}} b_{s,u} a_{u,t} = \sum_{\substack{u\in S;\\ t\leq u\leq s \text{ and } u\neq t}} b_{s,u} a_{u,t} + b_{s,t} a_{t,t}.$$

Now,

$$\begin{aligned}
\sum_{\substack{k\in S;\\ t\leq k\leq s}} b_{s,k} a_{k,t} &= \sum_{\substack{u\in S;\\ t\leq u\leq s}} b_{s,u} a_{u,t} \qquad \text{(here, we have renamed the summation index } k \text{ as } u\text{)} \\
&= \underbrace{\sum_{\substack{u\in S;\\ t\leq u\leq s \text{ and } u\neq t}}}_{\substack{= \sum_{\substack{u\in S;\\ t<u\leq s}} \\ \text{(because for any } u\in S\text{, the} \\ \text{condition } (t\leq u\leq s \text{ and } u\neq t) \\ \text{is equivalent to } (t<u\leq s))}} b_{s,u} a_{u,t} + \underbrace{b_{s,t}}_{\substack{=(a_{t,t})^{-1}\left(\delta_{s,t} - \sum_{\substack{u\in S;\\ t<u\leq s}} b_{s,u}a_{u,t}\right) \\ \text{(by the recursive definition of } b_{s,t}\text{)}}} a_{t,t} \\
&= \sum_{\substack{u\in S;\\ t<u\leq s}} b_{s,u} a_{u,t} + \underbrace{(a_{t,t})^{-1} \left(\delta_{s,t} - \sum_{\substack{u\in S;\\ t<u\leq s}} b_{s,u} a_{u,t} \right) a_{t,t}}_{=\delta_{s,t} - \sum_{\substack{u\in S;\\ t<u\leq s}} b_{s,u}a_{u,t}} \\
&= \sum_{\substack{u\in S;\\ t<u\leq s}} b_{s,u} a_{u,t} + \delta_{s,t} - \sum_{\substack{u\in S;\\ t<u\leq s}} b_{s,u} a_{u,t} = \delta_{s,t}.
\end{aligned}$$

Hence, (13.199.16) is proven in Case 1.

Let us now consider Case 2. In this case, we do not have $t \leq s$.

If we had $s = t$, then we would have $t = s \leq s$, which would contradict the fact that we do not have $t \leq s$. Hence, we do not have $s = t$. Therefore, $\delta_{s,t} = 0$.

If there was an $k \in S$ satisfying $t \leq k \leq s$, then we would have $t \leq s$, which would contradict the fact that we do not have $t \leq s$. Hence, there is no $k \in S$ satisfying $t \leq k \leq s$. Thus, the sum $\sum_{\substack{k\in S;\\ t\leq k\leq s}} b_{s,k} a_{k,t}$ is empty. Hence, $\sum_{\substack{k\in S;\\ t\leq k\leq s}} b_{s,k} a_{k,t} = (\text{empty sum}) = 0 = \delta_{s,t}$ (since $\delta_{s,t} = 0$). Hence, (13.199.16) is proven in Case 2.

We have now proven (13.199.16) in each of the two Cases 1 and 2. Thus, (13.199.16) always holds.

[1268]. Hence, $BA = I_S$ [1269]. Furthermore, for every $s \in S$, we have

$$b_{s,s} = (a_{s,s})^{-1} \tag{13.199.18}$$

[1270]. Hence,

$$\text{for every } s \in S, \text{ the element } b_{s,s} \text{ of } \mathbf{k} \text{ is invertible}$$

(because $b_{s,s}$ is an inverse (namely, $b_{s,s} = (a_{s,s})^{-1}$)). Thus, Lemma 13.199.9 (applied to B and $b_{s,t}$ instead of A and $a_{s,t}$) shows that $B \in \mathrm{IT}_S$ (since $B \in \mathrm{T}_S$). In other words, B belongs to IT_S.

So far, we do not know that B is the inverse of A; we merely know that B is a left inverse of A (that is, we know that $BA = I_S$). We shall now construct yet another $S \times S$-matrix C and subsequently show that $AC = I_S$; this will easily yield that A is invertible (because an element of a ring that has a left inverse and a right inverse must be invertible) and its inverse is $C = B$.

The construction of C will be rather similar to that of B, so that we will be briefer than before.

We shall define an element $c_{s,t}$ for each $(s,t) \in S \times S$. In fact, we will define these elements recursively, by strong induction on $|[t,s]|$: Let $N \in \mathbb{N}$. Assume that

$$\text{an element } c_{s,t} \in \mathbf{k} \text{ is already defined for each } (s,t) \in S \times S \text{ satisfying } |[t,s]| < N. \tag{13.199.20}$$

We shall now define an element $c_{s,t} \in \mathbf{k}$ for each $(s,t) \in S \times S$ satisfying $|[t,s]| = N$.

Indeed, let $(s,t) \in S \times S$ be such that $|[t,s]| = N$. We must define an element $c_{s,t} \in \mathbf{k}$.

For every $u \in S$ satisfying $t \le u < s$, the element $c_{u,t}$ is already defined[1271]. Thus, the sum $\sum\limits_{\substack{u\in S;\\ t\le u<s}} a_{s,u}c_{u,t} \in \mathbf{k}$ is well-defined. Furthermore, the element $a_{s,s}$ of $\mathbf{k}$ is invertible (by (13.199.12)). Hence, the element $(a_{s,s})^{-1}$

[1268] *Proof of (13.199.17):* Let $(s,t) \in S \times S$. Then,

$$\begin{aligned}
\sum_{k\in S} b_{s,k}a_{k,t} &= \sum_{\substack{k\in S;\\ t\le k}} b_{s,k}a_{k,t} + \sum_{\substack{k\in S;\\ \text{not } t\le k}} b_{s,k} \underbrace{a_{k,t}}_{\substack{=0\\ \text{(by (13.199.11), applied to}\\ (k,t) \text{ instead of } (s,t))}} = \sum_{\substack{k\in S;\\ t\le k}} b_{s,k}a_{k,t} + \underbrace{\sum_{\substack{k\in S;\\ \text{not } t\le k}} b_{s,k}0}_{=0} \\
&= \sum_{\substack{k\in S;\\ t\le k}} b_{s,k}a_{k,t} = \underbrace{\sum_{\substack{k\in S;\\ t\le k \text{ and } k\le s}}}_{=\sum_{\substack{k\in S;\\ t\le k\le s}}} b_{s,k}a_{k,t} + \sum_{\substack{k\in S;\\ t\le k \text{ and not } k\le s}} \underbrace{b_{s,k}}_{\substack{=0\\ \text{(by (13.199.15), applied to}\\ (s,k) \text{ instead of } (s,t))}} a_{k,t} \\
&= \sum_{\substack{k\in S;\\ t\le k\le s}} b_{s,k}a_{k,t} + \underbrace{\sum_{\substack{k\in S;\\ t\le k \text{ and not } k\le s}} 0a_{k,t}}_{=0} = \sum_{\substack{k\in S;\\ t\le k\le s}} b_{s,k}a_{k,t} = \delta_{s,t}
\end{aligned}$$

(by (13.199.16)). This proves (13.199.17).

[1269] *Proof.* Lemma 13.199.2 (applied to S, B, $b_{s,t}$, A and $a_{s,t}$ instead of T, A, $a_{s,t}$, B and $b_{s,t}$) shows that

$$BA = \left(\underbrace{\sum_{k\in S} b_{s,k}a_{k,t}}_{\substack{=\delta_{s,t}\\ \text{(by (13.199.17))}}} \right)_{(s,t)\in S\times S} = (\delta_{s,t})_{(s,t)\in S\times S} = I_S$$

(since $I_S = (\delta_{s,t})_{(s,t)\in S\times S}$ (by the definition of I_S)). Qed.

[1270] *Proof of (13.199.18):* Lemma 13.199.11 (applied to B, $b_{s,t}$, A and $a_{s,t}$ instead of A, $a_{s,t}$, B and $b_{s,t}$) yields that for every $s \in S$, we have

$$\sum_{k\in S} b_{s,k}a_{k,s} = b_{s,s}a_{s,s}. \tag{13.199.19}$$

Let $s \in S$. Then, (13.199.17) (applied to (s,s) instead of (s,t)) yields $\sum_{k\in S} b_{s,k}a_{k,s} = \delta_{s,s} = 1$ (since $s = s$). Comparing this with (13.199.19), we obtain $b_{s,s}a_{s,s} = 1$. Hence, $b_{s,s} = (a_{s,s})^{-1}$. This proves (13.199.18).

[1271] *Proof.* Let $u \in S$ be such that $t \le u < s$. We have to show that the element $c_{u,t}$ is already defined.

From (13.199.4) (applied to t, u and s instead of s, t and u), we conclude that $[t,u]$ is a proper subset of $[t,s]$. Hence, $|[t,u]| < |[t,s]|$ (since $[t,s]$ is a finite set). Thus, $|[t,u]| < |[t,s]| = N$. Therefore, (13.199.20) (applied to (u,t) instead of (s,t)) shows that an element $c_{u,t}$ is already defined.

of $\mathbf{k}$ is well-defined. Now, we set

$$c_{s,t} = (a_{s,s})^{-1} \left(\delta_{s,t} - \sum_{\substack{u \in S; \\ t \leq u < s}} a_{s,u} c_{u,t} \right) \tag{13.199.21}$$

(this makes sense since both $(a_{s,s})^{-1}$ and $\sum_{\substack{u \in S; \\ t \leq u < s}} a_{s,u} c_{u,t}$ are well-defined). Thus, we have defined an element $c_{s,t} \in \mathbf{k}$. This completes the recursive definition of $c_{s,t}$.

We have now defined an element $c_{s,t} \in \mathbf{k}$ for each $(s,t) \in S \times S$. In other words, we have defined a family $(c_{s,t})_{(s,t) \in S \times S} \in \mathbf{k}^{S \times S}$. This family is clearly an $S \times S$-matrix. Denote this $S \times S$-matrix by C. Thus, $C = (c_{s,t})_{(s,t) \in S \times S} \in \mathbf{k}^{S \times S}$. We shall now show (in several steps) that $AC = I_S$ and that $C \in \mathrm{IT}_S$.

First, we notice that

$$\text{every } (s,t) \in S \times S \text{ which does not satisfy } t \leq s \text{ must satisfy } c_{s,t} = 0 \tag{13.199.22}$$

[1272]. Hence, Lemma 13.199.5 (applied to C and $c_{s,t}$ instead of A and $a_{s,t}$) yields $C \in \mathrm{T}_S$.

For every $(s,t) \in S \times S$, we have

$$\sum_{\substack{k \in S; \\ t \leq k \leq s}} a_{s,k} c_{k,t} = \delta_{s,t} \tag{13.199.23}$$

[1273]. Thus, for every $(s,t) \in S \times S$, we have

$$\sum_{k \in S} a_{s,k} c_{k,t} = \delta_{s,t} \tag{13.199.24}$$

[1272] *Proof of (13.199.22):* The statement (13.199.22) is an analogue of (13.199.15), and has an analogous proof.

[1273] *Proof of (13.199.23):* The statement (13.199.23) is analogous to (13.199.16) and has an analogous proof. (The main difference is that we now need to split off the addend for $u = s$ from the sum $\sum_{\substack{u \in S; \\ t \leq u \leq s}} a_{s,u} c_{u,t}$, instead of splitting off the addend for $u = t$ from the sum $\sum_{\substack{u \in S; \\ t \leq u \leq s}} b_{s,u} a_{u,t}$.)

[1274]. Hence, $AC = I_S$ [1275]. Now, using the associativity of the $\mathbf{k}$-algebra $\mathbf{k}^{S\times S}$, we can make the following computation:

$$B = B \underbrace{I_S}_{=AC} = \underbrace{BA}_{=I_S} C = I_S C = C.$$

Hence, $AC = I_S$ rewrites as $AB = I_S$. Combining this with $BA = I_S$, we see that B is an inverse of A in the ring $\mathbf{k}^{S\times S}$. In particular, the element A of $\mathbf{k}^{S\times S}$ is invertible. Its inverse A^{-1} is B (as we have just proven), and therefore belongs to IT_S (since we know that B belongs to IT_S). This proves Claim B3.

Recall that IT_S is a subset of $\mathbf{k}^{S\times S}$. Claim B1 and Claim B2 (combined) show that this set IT_S is a submonoid of the multiplicative monoid of $\mathbf{k}^{S\times S}$. Claim B3 furthermore proves that this submonoid is a group. Thus, IT_S is a group with respect to multiplication. In other words, the set of all invertibly triangular $S \times S$-matrices is a group with respect to multiplication (since IT_S is the set of all invertibly triangular $S \times S$-matrices). This proves Proposition 11.1.10(b).

(c) We shall first prove the following claims:

Claim C1: We have $I_S \in \mathrm{UT}_S$.

Claim C2: For every $A \in \mathrm{UT}_S$ and $B \in \mathrm{UT}_S$, we have $AB \in \mathrm{UT}_S$.

Claim C3: Let $A \in \mathrm{UT}_S$. Then, A is invertible (as an element of the ring $\mathbf{k}^{S\times S}$), and its inverse A^{-1} belongs to UT_S.

Proof of Claim C1: The definition of I_S yields $I_S = (\delta_{s,t})_{(s,t)\in S\times S}$. Claim A4 in our proof of Proposition 11.1.10(a) yields $I_S \in \mathrm{T}_S$. For every $s \in S$, we have $\delta_{s,s} = 1$. Thus, Lemma 13.199.15 (applied to I_S and $\delta_{s,t}$ instead of A and $a_{s,t}$) yields $I_S \in \mathrm{UT}_S$. This proves Claim C1.

Proof of Claim C2: Let $A \in \mathrm{UT}_S$ and $B \in \mathrm{UT}_S$.

Write the $S \times S$-matrix A in the form $A = (a_{s,t})_{(s,t)\in S\times S}$. Write the $S \times S$-matrix B in the form $B = (b_{s,t})_{(s,t)\in S\times S}$.

We know that A is unitriangular $S \times S$-matrix (by Lemma 13.199.12). Hence, $A \in \mathrm{T}_S$ (by Lemma 13.199.13). Similarly, $B \in \mathrm{T}_S$.

Lemma 13.199.14 yields that

$$\text{for every } s \in S, \text{ we have } a_{s,s} = 1. \tag{13.199.25}$$

[1274] *Proof of (13.199.24):* Let $(s,t) \in S \times S$. Then,

$$\begin{aligned}\sum_{k\in S} a_{s,k}c_{k,t} &= \sum_{\substack{k\in S;\\ t\le k}} a_{s,k}c_{k,t} + \sum_{\substack{k\in S;\\ \text{not } t\le k}} a_{s,k} \underbrace{c_{k,t}}_{\substack{=0\\ \text{(by (13.199.22), applied to}\\ (k,t) \text{ instead of } (s,t))}} = \sum_{\substack{k\in S;\\ t\le k}} a_{s,k}c_{k,t} + \underbrace{\sum_{\substack{k\in S;\\ \text{not } t\le k}} a_{s,k}0}_{=0}\\
&= \sum_{\substack{k\in S;\\ t\le k}} a_{s,k}c_{k,t} = \underbrace{\sum_{\substack{k\in S;\\ t\le k \text{ and } k\le s}}}_{=\sum_{\substack{k\in S;\\ t\le k\le s}}} a_{s,k}c_{k,t} + \sum_{\substack{k\in S;\\ t\le k \text{ and not } k\le s}} \underbrace{a_{s,k}}_{\substack{=0\\ \text{(by (13.199.11), applied to}\\ (s,k) \text{ instead of } (s,t))}} c_{k,t}\\
&= \sum_{\substack{k\in S;\\ t\le k\le s}} a_{s,k}c_{k,t} + \underbrace{\sum_{\substack{k\in S;\\ t\le k \text{ and not } k\le s}} 0c_{k,t}}_{=0} = \sum_{\substack{k\in S;\\ t\le k\le s}} a_{s,k}c_{k,t} = \delta_{s,t}\end{aligned}$$

(by (13.199.23)). This proves (13.199.24).

[1275] *Proof.* Lemma 13.199.2 (applied to S, C and $c_{s,t}$ instead of T, B and $b_{s,t}$) shows that

$$AC = \left(\underbrace{\sum_{k\in S} a_{s,k}c_{k,t}}_{\substack{=\delta_{s,t}\\ \text{(by (13.199.24))}}} \right)_{(s,t)\in S\times S} = (\delta_{s,t})_{(s,t)\in S\times S} = I_S$$

(since $I_S = (\delta_{s,t})_{(s,t)\in S\times S}$ (by the definition of I_S)). Qed.

The same argument (applied to B and $b_{s,t}$ instead of A and $a_{s,t}$) yields that

$$\text{for every } s \in S\text{, we have } b_{s,s} = 1. \tag{13.199.26}$$

Claim A5 in our proof of Proposition 11.1.10(a) yields $AB \in \mathrm{T}_S$. Lemma 13.199.2 (applied to $T = S$) yields

$$AB = \left(\sum_{k \in S} a_{s,k} b_{k,t}\right)_{(s,t) \in S \times S}.$$

Lemma 13.199.11 yields that, for every $s \in S$, we have

$$\sum_{k \in S} a_{s,k} b_{k,s} = \underbrace{a_{s,s}}_{\substack{=1 \\ \text{(by (13.199.25))}}} \underbrace{b_{s,s}}_{\substack{=1 \\ \text{(by (13.199.26))}}} = 1.$$

Hence, Lemma 13.199.15 (applied to AB and $\sum_{k \in S} a_{s,k} b_{k,t}$ instead of A and $a_{s,t}$) shows that $AB \in \mathrm{UT}_S$ (since $AB = \left(\sum_{k \in S} a_{s,k} b_{k,t}\right)_{(s,t) \in S \times S}$ and $AB \in \mathrm{T}_S$). This proves Claim C2.

Proof of Claim C3: We know that A is unitriangular $S \times S$-matrix (by Lemma 13.199.12). Hence, $A \in \mathrm{T}_S$ (by Lemma 13.199.13).

Write the $S \times S$-matrix A in the form $A = (a_{s,t})_{(s,t) \in S \times S}$. Lemma 13.199.14 yields that

$$\text{for every } s \in S\text{, we have } a_{s,s} = 1. \tag{13.199.27}$$

We have $A \in \mathrm{UT}_S \subset \mathrm{IT}_S$ (by Lemma 13.199.17). Thus, the conditions of Claim B3 (in our proof of Proposition 11.1.10(b)) are satisfied. Define an $S \times S$-matrix $B = (b_{s,t})_{(s,t) \in S \times S} \in \mathbf{k}^{S \times S}$ as in the proof of Claim B3 (in our proof of Proposition 11.1.10(b)). Then, we have the following facts (which were shown in the proof of Claim B3):

- For every $s \in S$, we have
$$b_{s,s} = (a_{s,s})^{-1}. \tag{13.199.28}$$
- We have $B \in \mathrm{T}_S$.
- The matrix B is an inverse of A in the ring $\mathbf{k}^{S \times S}$.

Now, for every $s \in S$, we have

$$b_{s,s} = \left(\underbrace{a_{s,s}}_{\substack{=1 \\ \text{(by (13.199.27))}}} \right)^{-1} = 1^{-1} = 1.$$

Hence, Lemma 13.199.15 (applied to B and $b_{s,t}$ instead of A and $a_{s,t}$) shows that $B \in \mathrm{UT}_S$ (since $B = (b_{s,t})_{(s,t) \in S \times S}$ and $B \in \mathrm{T}_S$). In other words, B belongs to UT_S.

Now, recall that B is an inverse of A in the ring $\mathbf{k}^{S \times S}$. In particular, the element A of $\mathbf{k}^{S \times S}$ is invertible. Its inverse A^{-1} is B (as we have just proven), and therefore belongs to UT_S (since we know that B belongs to UT_S). This proves Claim C3.

Recall that UT_S is a subset of $\mathbf{k}^{S \times S}$. Claim C1 and Claim C2 (combined) show that this set UT_S is a submonoid of the multiplicative monoid of $\mathbf{k}^{S \times S}$. Claim C3 furthermore proves that this submonoid is a group. Thus, UT_S is a group with respect to multiplication. In other words, the set of all unitriangular $S \times S$-matrices is a group with respect to multiplication (since UT_S is the set of all unitriangular $S \times S$-matrices). This proves Proposition 11.1.10(c).

(d) Let A be an invertibly triangular $S \times S$-matrix. In other words, $A \in \mathrm{IT}_S$ (since IT_S is the set of all invertibly triangular $S \times S$-matrices). Hence, Claim B3 (in our proof of Proposition 11.1.10(b)) shows that A is invertible, and that its inverse A^{-1} belongs to IT_S. The matrix A^{-1} is therefore an invertibly triangular $S \times S$-matrix (by Lemma 13.199.6 (applied to A^{-1} instead of A)).

Now, forget that we fixed A. We thus have shown that if A is an invertibly triangular $S \times S$-matrix, then A is invertible, and its inverse A^{-1} is again invertibly triangular. This proves Proposition 11.1.10(d).

(e) Let A be a unitriangular $S \times S$-matrix. In other words, $A \in \mathrm{UT}_S$ (since UT_S is the set of all unitriangular $S \times S$-matrices). Hence, Claim C3 (in our proof of Proposition 11.1.10(c)) shows that A is invertible, and that its inverse A^{-1} belongs to UT_S. The matrix A^{-1} is therefore a unitriangular $S \times S$-matrix (by Lemma 13.199.12 (applied to A^{-1} instead of A)).

Now, forget that we fixed A. We thus have shown that if A is a unitriangular $S \times S$-matrix, then A is invertible, and its inverse A^{-1} is again unitriangular. This proves Proposition 11.1.10(e). □

Thus, Exercise 11.1.11 is solved.

13.200. **Solution to Exercise 11.1.15.** *Solution to Exercise 11.1.15.* Before we prove Theorem 11.1.14, let us introduce a notation:

Definition 13.200.1. Let M be a $\mathbf{k}$-module. Let $(h_p)_{p \in P}$ be a family of elements of M. Then, we let $\langle h_p \mid p \in P \rangle$ denote the $\mathbf{k}$-submodule of M spanned by this family $(h_p)_{p \in P}$.

Proof of Theorem 11.1.14. Write the matrix A in the form $A = (a_{s,t})_{(s,t) \in S \times T}$.

We have assumed that the family $(e_s)_{s \in S}$ expands in the family $(f_t)_{t \in T}$ through the matrix A. In other words,

$$\text{every } s \in S \text{ satisfies } e_s = \sum_{t \in T} a_{s,t} f_t \tag{13.200.1}$$

(by the definition of "the family $(e_s)_{s \in S}$ expands in the family $(f_t)_{t \in T}$ through the matrix A").

Let B be the $T \times S$-matrix A^{-1}. Write the $T \times S$-matrix B as $B = (b_{s,t})_{(s,t) \in T \times S}$. From $B = A^{-1}$, we obtain $BA = I_T$ and $AB = I_S$. These two equalities show that the matrix B has an inverse (namely, A); thus, the matrix B is invertible. In other words, the matrix A^{-1} is invertible (since $B = A^{-1}$).

Lemma 13.199.2 (applied to T, S, B, $b_{s,t}$, A and $a_{s,t}$ instead of S, T, A, $a_{s,t}$, B and $b_{s,t}$) yields

$$BA = \left(\sum_{k \in S} b_{s,k} a_{k,t} \right)_{(s,t) \in T \times T}.$$

Hence,

$$\left(\sum_{k \in S} b_{s,k} a_{k,t} \right)_{(s,t) \in T \times T} = BA = I_T = (\delta_{s,t})_{(s,t) \in T \times T}$$

(by the definition of I_T). In other words,

$$\sum_{k \in S} b_{s,k} a_{k,t} = \delta_{s,t} \qquad \text{for every } (s,t) \in T \times T. \tag{13.200.2}$$

Now,

$$\text{every } u \in T \text{ satisfies } f_u = \sum_{k \in S} b_{u,k} e_k \tag{13.200.3}$$

[1276]. Renaming the indices u and k as s and t in this statement, we obtain the following:

$$\text{every } s \in T \text{ satisfies } f_s = \sum_{t\in S} b_{s,t} e_t. \tag{13.200.4}$$

We have $(f_t)_{t\in T} = (f_s)_{s\in T}$ (here, we renamed the index t as s) and $(e_s)_{s\in S} = (e_t)_{t\in S}$ (here, we renamed the index s as t).

Recall that $B = (b_{s,t})_{(s,t)\in T\times S}$. Hence, the family $(f_s)_{s\in T}$ expands in the family $(e_t)_{t\in S}$ through the matrix B if and only if

$$\text{every } s \in T \text{ satisfies } f_s = \sum_{t\in S} b_{s,t} e_t$$

(by the definition of "the family $(f_s)_{s\in T}$ expands in the family $(e_t)_{t\in S}$ through the matrix B"). Thus, we conclude that the family $(f_s)_{s\in T}$ expands in the family $(e_t)_{t\in S}$ through the matrix B (since every $s \in T$ satisfies $f_s = \sum_{t\in S} b_{s,t} e_t$). In other words, the family $(f_t)_{t\in T}$ expands in the family $(e_s)_{s\in S}$ through the matrix A^{-1} (since $(f_t)_{t\in T} = (f_s)_{s\in T}$ and $(e_s)_{s\in S} = (e_t)_{t\in S}$ and $A^{-1} = B$). This proves Theorem 11.1.14(a).

(b) We shall prove the following two claims:

Claim B1: We have $\langle e_s \mid s \in S\rangle \subset \langle f_t \mid t \in T\rangle$.

Claim B2: We have $\langle f_t \mid t \in T\rangle \subset \langle e_s \mid s \in S\rangle$.

Proof of Claim B1: We need to prove that $\langle e_s \mid s \in S\rangle \subset \langle f_t \mid t \in T\rangle$. Since $\langle f_t \mid t \in T\rangle$ is a $\mathbf{k}$-module, we only need to show that $e_s \in \langle f_t \mid t \in T\rangle$ for each $s \in S$. But the latter fact follows from (13.200.1). Thus, Claim B1 is proven.

Proof of Claim B2: Theorem 11.1.14(a) shows that the family $(f_t)_{t\in T}$ expands in the family $(e_s)_{s\in S}$ through the matrix A^{-1}. Moreover, we know that the matrix A^{-1} is invertible. Hence, we can apply Claim B1 to T, S, $(f_t)_{t\in T}$, $(e_s)_{s\in S}$ and A^{-1} instead of S, T, $(e_s)_{s\in S}$, $(f_t)_{t\in T}$ and A. As a result, we conclude that $\langle f_t \mid t \in T\rangle \subset \langle e_s \mid s \in S\rangle$. This proves Claim B2.

Combining Claim B1 with Claim B2, we obtain $\langle e_s \mid s \in S\rangle = \langle f_t \mid t \in T\rangle$. Now,

$$\begin{aligned}
&\left(\text{the } \mathbf{k}\text{-submodule of } M \text{ spanned by the family } (e_s)_{s\in S}\right)\\
&= \langle e_s \mid s \in S\rangle = \langle f_t \mid t \in T\rangle\\
&= \left(\text{the } \mathbf{k}\text{-submodule of } M \text{ spanned by the family } (f_t)_{t\in T}\right). \qquad (13.200.5)
\end{aligned}$$

This proves Theorem 11.1.14(b).

[1276] *Proof of (13.200.3):* Let $u \in T$. Then,

$$\begin{aligned}
\sum_{k\in S} b_{u,k} \underbrace{e_k}_{\substack{=\sum_{t\in T} a_{k,t} f_t \\ \text{(by (13.200.1), applied to } s=k)}}
&= \sum_{k\in S} b_{u,k} \sum_{t\in T} a_{k,t} f_t = \underbrace{\sum_{k\in S}\sum_{t\in T}}_{=\sum_{t\in T}\sum_{k\in S}} b_{u,k} a_{k,t} f_t\\
&= \sum_{t\in T}\sum_{k\in S} b_{u,k} a_{k,t} f_t = \sum_{t\in T} \underbrace{\left(\sum_{k\in S} b_{u,k} a_{k,t}\right)}_{\substack{=\delta_{u,t} \\ \text{(by (13.200.2), applied to} \\ (u,t) \text{ instead of } (s,t))}} f_t\\
&= \sum_{t\in T} \delta_{u,t} f_t = \underbrace{\delta_{u,u}}_{=1} f_u + \sum_{\substack{t\in T;\\ t\neq u}} \underbrace{\delta_{u,t}}_{\substack{=0\\ \text{(since } t\neq u)}} f_t\\
&\qquad \text{(here, we have split off the addend for } t = u \text{ from the sum)}\\
&= f_u + \underbrace{\sum_{\substack{t\in T;\\ t\neq u}} 0 f_t}_{=0} = f_u.
\end{aligned}$$

This proves (13.200.3).

(c) We have the following chain of logical equivalences:

$$\begin{aligned}
&\left(\text{the family } \left(e_s\right)_{s\in S} \text{ spans the } \mathbf{k}\text{-module } M\right)\\
\iff &\left(\underbrace{\left(\text{the } \mathbf{k}\text{-submodule of } M \text{ spanned by the family } \left(e_s\right)_{s\in S}\right)}_{\substack{=\left(\text{the } \mathbf{k}\text{-submodule of } M \text{ spanned by the family } \left(f_t\right)_{t\in T}\right)\\ \text{(by (13.200.5))}}} = M\right)\\
\iff &\left(\left(\text{the } \mathbf{k}\text{-submodule of } M \text{ spanned by the family } \left(f_t\right)_{t\in T}\right) = M\right)\\
\iff &\left(\text{the family } \left(f_t\right)_{t\in T} \text{ spans the } \mathbf{k}\text{-module } M\right).
\end{aligned}$$

In other words, the family $\left(e_s\right)_{s\in S}$ spans the **k**-module M if and only if the family $\left(f_t\right)_{t\in T}$ spans the **k**-module M. This proves Theorem 11.1.14(c).

(d) We shall show the following two claims:

> *Claim D1:* If the family $\left(f_t\right)_{t\in T}$ is **k**-linearly independent, then the family $\left(e_s\right)_{s\in S}$ is **k**-linearly independent.
>
> *Claim D2:* If the family $\left(e_s\right)_{s\in S}$ is **k**-linearly independent, then the family $\left(f_t\right)_{t\in T}$ is **k**-linearly independent.

Proof of Claim D1: Assume that the family $\left(f_t\right)_{t\in T}$ is **k**-linearly independent. In other words, if $\left(\mu_t\right)_{t\in T} \in \mathbf{k}^T$ is any family of elements of **k** satisfying $\sum_{t\in T} \mu_t f_t = 0$, then

$$\left(\mu_t\right)_{t\in T} = \left(0\right)_{t\in T}. \tag{13.200.6}$$

Let $\left(\lambda_s\right)_{s\in S} \in \mathbf{k}^S$ be a family of elements of S such that $\sum_{s\in S} \lambda_s e_s = 0$. We shall show that $\left(\lambda_s\right)_{s\in S} = \left(0\right)_{s\in S}$.

We have $\sum_{s\in S} \lambda_s e_s = 0$. Comparing this with

$$\begin{aligned}
\sum_{s\in S} \lambda_s \underbrace{e_s}_{\substack{=\sum_{t\in T} a_{s,t} f_t\\ \text{(by (13.200.1))}}} &= \sum_{s\in S} \lambda_s \left(\sum_{t\in T} a_{s,t} f_t\right) = \underbrace{\sum_{s\in S}\sum_{t\in T}}_{=\sum_{t\in T}\sum_{s\in S}} \lambda_s a_{s,t} f_t\\
&= \sum_{t\in T}\sum_{s\in S} \lambda_s a_{s,t} f_t = \sum_{t\in T} \left(\sum_{s\in S} \lambda_s a_{s,t}\right) f_t,
\end{aligned}$$

we obtain $\sum_{t\in T} \left(\sum_{s\in S} \lambda_s a_{s,t}\right) f_t = 0$. Hence, (13.200.6) (applied to $\mu_t = \sum_{s\in S} \lambda_s a_{s,t}$) yields $\left(\sum_{s\in S} \lambda_s a_{s,t}\right)_{t\in T} = \left(0\right)_{t\in T}$. In other words,

$$\sum_{s\in S} \lambda_s a_{s,t} = 0 \qquad \text{for every } t \in T. \tag{13.200.7}$$

But Lemma 13.199.2 yields

$$AB = \left(\sum_{k\in T} a_{s,k} b_{k,t}\right)_{(s,t)\in S\times S}.$$

Hence,

$$\left(\sum_{k\in T} a_{s,k} b_{k,t}\right)_{(s,t)\in S\times S} = AB = I_S = \left(\delta_{s,t}\right)_{(s,t)\in S\times S}$$

(by the definition of I_S). In other words,

$$\sum_{k\in T} a_{s,k} b_{k,t} = \delta_{s,t} \qquad \text{for every } (s,t) \in S \times S. \tag{13.200.8}$$

Now, fix $u \in S$. Then,

$$\begin{aligned}\sum_{s\in S}\sum_{k\in T}\lambda_s a_{s,k}b_{k,u} &= \sum_{s\in S}\lambda_s \underbrace{\sum_{k\in T} a_{s,k}b_{k,u}}_{\substack{=\delta_{s,u} \\ \text{(by (13.200.8)} \\ \text{(applied to } (s,u) \text{ instead of } (s,t)))}} = \sum_{s\in S}\lambda_s\delta_{s,u} \\ &= \lambda_u \underbrace{\delta_{u,u}}_{=1} + \sum_{\substack{s\in S;\\ s\neq u}} \lambda_s \underbrace{\delta_{s,u}}_{\substack{=0 \\ \text{(since } s\neq u)}} \\ &\qquad \text{(here, we have split off the addend for } s=u \text{ from the sum)} \\ &= \lambda_u + \underbrace{\sum_{\substack{s\in S;\\ s\neq u}} \lambda_s 0}_{=0} = \lambda_u.\end{aligned}$$

Hence,

$$\begin{aligned}\lambda_u &= \underbrace{\sum_{s\in S}\sum_{k\in T}}_{=\sum_{k\in T}\sum_{s\in S}} \lambda_s a_{s,k}b_{k,u} = \sum_{k\in T}\sum_{s\in S}\lambda_s a_{s,k}b_{k,u} \\ &= \sum_{k\in T} \underbrace{\left(\sum_{s\in S}\lambda_s a_{s,k}\right)}_{\substack{=0 \\ \text{(by (13.200.7) (applied to } t=k))}} b_{k,u} = \sum_{k\in T} 0 b_{k,u} = 0.\end{aligned}$$

Now, forget that we fixed u. We thus have proven that $\lambda_u = 0$ for every $u \in S$. Renaming the index u as s in this statement, we obtain the following: We have $\lambda_s = 0$ for every $s \in S$. In other words, $(\lambda_s)_{s\in S} = (0)_{s\in S}$.

Now, forget that we fixed $(\lambda_s)_{s\in S}$. We thus have shown that if $(\lambda_s)_{s\in S} \in \mathbf{k}^S$ is a family of elements of S such that $\sum_{s\in S}\lambda_s e_s = 0$, then $(\lambda_s)_{s\in S} = (0)_{s\in S}$. In other words, the family $(e_s)_{s\in S}$ is $\mathbf{k}$-linearly independent. This proves Claim D1.

Proof of Claim D2: Theorem 11.1.14(a) shows that the family $(f_t)_{t\in T}$ expands in the family $(e_s)_{s\in S}$ through the matrix A^{-1}. Moreover, we know that the matrix A^{-1} is invertible. Hence, we can apply Claim D1 to T, S, $(f_t)_{t\in T}$, $(e_s)_{s\in S}$ and A^{-1} instead of S, T, $(e_s)_{s\in S}$, $(f_t)_{t\in T}$ and A. As a result, we conclude that if the family $(e_s)_{s\in S}$ is $\mathbf{k}$-linearly independent, then the family $(f_t)_{t\in T}$ is $\mathbf{k}$-linearly independent. Claim D2 is thus proven.

Now, Claim D1 and Claim D2 are two mutually converse implications. Combining these two implications, we obtain an equivalence; this equivalence is precisely Theorem 11.1.14(d).

(e) The family $(e_s)_{s\in S}$ is a basis of the $\mathbf{k}$-module M if and only if it spans the $\mathbf{k}$-module M and is $\mathbf{k}$-linearly independent (by the definition of a basis). Thus, we have the following chain of logical equivalences:

$$\begin{aligned}&\left(\text{the family } (e_s)_{s\in S} \text{ is a basis of the } \mathbf{k}\text{-module } M\right) \\ \iff &\left(\text{the family } (e_s)_{s\in S} \text{ spans the } \mathbf{k}\text{-module } M \text{ and is } \mathbf{k}\text{-linearly independent}\right) \\ \iff &\underbrace{\left(\text{the family } (e_s)_{s\in S} \text{ spans the } \mathbf{k}\text{-module } M\right)}_{\substack{\iff \left(\text{the family } (f_t)_{t\in T} \text{ spans the } \mathbf{k}\text{-module } M\right) \\ \text{(by Theorem 11.1.14(c))}}} \\ &\quad \wedge \underbrace{\left(\text{the family } (e_s)_{s\in S} \text{ is } \mathbf{k}\text{-linearly independent}\right)}_{\substack{\iff \left(\text{the family } (f_t)_{t\in T} \text{ is } \mathbf{k}\text{-linearly independent}\right) \\ \text{(by Theorem 11.1.14(d))}}} \\ \iff &\left(\text{the family } (f_t)_{t\in T} \text{ spans the } \mathbf{k}\text{-module } M\right) \\ &\quad \wedge \left(\text{the family } (f_t)_{t\in T} \text{ is } \mathbf{k}\text{-linearly independent}\right). \end{aligned} \tag{13.200.9}$$

On the other hand, the family $(f_t)_{t\in T}$ is a basis of the $\mathbf{k}$-module M if and only if it spans the $\mathbf{k}$-module M and is $\mathbf{k}$-linearly independent (by the definition of a basis). Thus, we have the following chain of logical equivalences:

$$\begin{aligned}
&\left(\text{the family } (f_t)_{t\in T} \text{ is a basis of the } \mathbf{k}\text{-module } M\right)\\
\iff &\left(\text{the family } (f_t)_{t\in T} \text{ spans the } \mathbf{k}\text{-module } M \text{ and is } \mathbf{k}\text{-linearly independent}\right)\\
\iff &\left(\text{the family } (f_t)_{t\in T} \text{ spans the } \mathbf{k}\text{-module } M\right)\\
&\quad \wedge \left(\text{the family } (f_t)_{t\in T} \text{ is } \mathbf{k}\text{-linearly independent}\right)\\
\iff &\left(\text{the family } (e_s)_{s\in S} \text{ is a basis of the } \mathbf{k}\text{-module } M\right)\\
&\quad (\text{by } (13.200.9)).
\end{aligned}$$

This proves Theorem 11.1.14(e). □

Thus, Exercise 11.1.15 is solved.

13.201. **Solution to Exercise 11.1.20.** *Solution to Exercise 11.1.20.*

Proof of Remark 11.1.17. (a) We shall prove the following two claims:

Claim A1: If the family $(e_s)_{s\in S}$ expands triangularly in the family $(f_s)_{s\in S}$, then every $s\in S$ satisfies

$$e_s = (\text{a } \mathbf{k}\text{-linear combination of the elements } f_t \text{ for } t\in S \text{ satisfying } t\leq s).$$

Claim A2: If every $s\in S$ satisfies

$$e_s = (\text{a } \mathbf{k}\text{-linear combination of the elements } f_t \text{ for } t\in S \text{ satisfying } t\leq s),$$

then the family $(e_s)_{s\in S}$ expands triangularly in the family $(f_s)_{s\in S}$.

Proof of Claim A1: Assume that the family $(e_s)_{s\in S}$ expands triangularly in the family $(f_s)_{s\in S}$. In other words, there exists a triangular $S\times S$-matrix A such that the family $(e_s)_{s\in S}$ expands in the family $(f_s)_{s\in S}$ through the matrix A. Consider this A.

Write the matrix A in the form $A=(a_{s,t})_{(s,t)\in S\times S}$.

The family $(e_s)_{s\in S}$ expands in the family $(f_s)_{s\in S}$ through the matrix A. In other words,

$$\text{every } s\in S \text{ satisfies } e_s=\sum_{t\in S} a_{s,t} f_t. \tag{13.201.1}$$

Lemma 13.199.4 shows that

$$\text{every } (s,t)\in S\times S \text{ which does not satisfy } t\leq s \text{ must satisfy } a_{s,t}=0 \tag{13.201.2}$$

(since $A=(a_{s,t})_{(s,t)\in S\times S}$ is a triangular $S\times S$-matrix). Hence, every $s\in S$ satisfies

$$\begin{aligned}
e_s &= \sum_{t\in S} a_{s,t} f_t \qquad (\text{by } (13.201.1))\\
&= \sum_{\substack{t\in S;\\ t\leq s}} a_{s,t} f_t + \sum_{\substack{t\in S;\\ \text{not } t\leq s}} \underbrace{a_{s,t}}_{\substack{=0\\ (\text{by } (13.201.2))}} f_t\\
&= \sum_{\substack{t\in S;\\ t\leq s}} a_{s,t} f_t + \underbrace{\sum_{\substack{t\in S;\\ \text{not } t\leq s}} 0 f_t}_{=0} = \sum_{\substack{t\in S;\\ t\leq s}} a_{s,t} f_t\\
&= (\text{a } \mathbf{k}\text{-linear combination of the elements } f_t \text{ for } t\in S \text{ satisfying } t\leq s).
\end{aligned}$$

This proves Claim A1.

Proof of Claim A2: Assume that every $s\in S$ satisfies

$$e_s = (\text{a } \mathbf{k}\text{-linear combination of the elements } f_t \text{ for } t\in S \text{ satisfying } t\leq s). \tag{13.201.3}$$

In other words, for every $s \in S$, there exists a family $(c_{s,t})_{t\in S;\ t\leq s} \in \mathbf{k}^{\{t\in S \mid t\leq s\}}$ such that

$$e_s = \sum_{\substack{t\in S;\\ t\leq s}} c_{s,t} f_t. \tag{13.201.4}$$

Fix such a family for each $s \in S$.

Now, define an $S \times S$-matrix $B = (b_{s,t})_{(s,t)\in S\times S} \in \mathbf{k}^{S\times S}$ by

$$\left(b_{s,t} = \begin{cases} c_{s,t}, & \text{if } t \leq s; \\ 0, & \text{otherwise} \end{cases} \qquad \text{for every } (s,t) \in S \times S \right).$$

Every $(s,t) \in S \times S$ which does not satisfy $t \leq s$ must satisfy

$$b_{s,t} = 0 \qquad \text{(by the definition of } b_{s,t}\text{)}. \tag{13.201.5}$$

In other words, the $S \times S$-matrix B is triangular (by the definition of "triangular").

On the other hand, every $(s,t) \in S \times S$ which satisfies $t \leq s$ must satisfy

$$b_{s,t} = c_{s,t} \qquad \text{(by the definition of } b_{s,t}\text{)}. \tag{13.201.6}$$

Now,

$$\text{every } s \in S \text{ satisfies } e_s = \sum_{t\in S} b_{s,t} f_t \tag{13.201.7}$$

[1277]. In other words, the family $(e_s)_{s\in S}$ expands in the family $(f_s)_{s\in S}$ through the matrix B (since $B = (b_{s,t})_{(s,t)\in S\times S}$). Hence, the family $(e_s)_{s\in S}$ expands triangularly in the family $(f_s)_{s\in S}$ (since the matrix B is triangular). This proves Claim A2.

We have now proven Claim A1 and Claim A2. These two claims are mutually converse implications. Combining these two implications, we obtain an equivalence, which is precisely the statement of Remark 11.1.17(a). Thus, Remark 11.1.17(a) is proven.

(b) We shall prove the following two claims:

Claim B1: If the family $(e_s)_{s\in S}$ expands invertibly triangularly in the family $(f_s)_{s\in S}$, then every $s \in S$ satisfies

$$e_s = \alpha_s f_s + (\text{a } \mathbf{k}\text{-linear combination of the elements } f_t \text{ for } t \in S \text{ satisfying } t < s)$$

for some invertible $\alpha_s \in \mathbf{k}$.

Claim B2: If every $s \in S$ satisfies

$$e_s = \alpha_s f_s + (\text{a } \mathbf{k}\text{-linear combination of the elements } f_t \text{ for } t \in S \text{ satisfying } t < s)$$

for some invertible $\alpha_s \in \mathbf{k}$, then the family $(e_s)_{s\in S}$ expands invertibly triangularly in the family $(f_s)_{s\in S}$.

Proof of Claim B1: Assume that the family $(e_s)_{s\in S}$ expands invertibly triangularly in the family $(f_s)_{s\in S}$. In other words, there exists an invertibly triangular $S \times S$-matrix A such that the family $(e_s)_{s\in S}$ expands in the family $(f_s)_{s\in S}$ through the matrix A. Consider this A.

Write the matrix A in the form $A = (a_{s,t})_{(s,t)\in S\times S}$.

The family $(e_s)_{s\in S}$ expands in the family $(f_s)_{s\in S}$ through the matrix A. In other words,

$$\text{every } s \in S \text{ satisfies } e_s = \sum_{t\in S} a_{s,t} f_t. \tag{13.201.8}$$

[1277] *Proof of (13.201.7):* Let $s \in S$. Then, every $t \in S$ satisfies either $t \leq s$ or (not $t \leq s$). Hence,

$$\sum_{t\in S} b_{s,t} f_t = \sum_{\substack{t\in S;\\ t\leq s}} \underbrace{b_{s,t}}_{\substack{=c_{s,t}\\ \text{(by (13.201.6))}}} f_t + \sum_{\substack{t\in S;\\ \text{not } t\leq s}} \underbrace{b_{s,t}}_{\substack{=0\\ \text{(by (13.201.5))}}} f_t = \sum_{\substack{t\in S;\\ t\leq s}} c_{s,t} f_t + \underbrace{\sum_{\substack{t\in S;\\ \text{not } t\leq s}} 0 f_t}_{=0}$$

$$= \sum_{\substack{t\in S;\\ t\leq s}} c_{s,t} f_t = e_s \qquad \text{(by (13.201.4))}.$$

This proves (13.201.7).

Lemma 13.199.7 shows that $A \in \mathrm{T}_S$ (since A is an invertibly triangular $S \times S$-matrix). Thus, Lemma 13.199.3 shows that A is a triangular $S \times S$-matrix. Hence, Lemma 13.199.4 shows that

$$\text{every } (s,t) \in S \times S \text{ which does not satisfy } t \leq s \text{ must satisfy } a_{s,t} = 0 \tag{13.201.9}$$

(since $A = (a_{s,t})_{(s,t) \in S \times S}$ is a triangular $S \times S$-matrix). Now, it is easy to show that every $s \in S$ satisfies

$$e_s = \alpha_s f_s + (\text{a } \mathbf{k}\text{-linear combination of the elements } f_t \text{ for } t \in S \text{ satisfying } t < s)$$

for some invertible $\alpha_s \in \mathbf{k}$ [1278]. Thus, Claim B1 is proven.

Proof of Claim B2: Assume that every $s \in S$ satisfies

$$e_s = \alpha_s f_s + (\text{a } \mathbf{k}\text{-linear combination of the elements } f_t \text{ for } t \in S \text{ satisfying } t < s) \tag{13.201.10}$$

for some invertible $\alpha_s \in \mathbf{k}$. Consider this α_s.

Now, for every $s \in S$, there exists a family $(c_{s,t})_{t \in S;\ t < s} \in \mathbf{k}^{\{t \in S \mid t < s\}}$ such that

$$e_s - \alpha_s f_s = \sum_{\substack{t \in S; \\ t < s}} c_{s,t} f_t \tag{13.201.11}$$

[1279]. Fix such a family for each $s \in S$.

Now, define an $S \times S$-matrix $B = (b_{s,t})_{(s,t) \in S \times S} \in \mathbf{k}^{S \times S}$ by

$$\left(b_{s,t} = \begin{cases} c_{s,t}, & \text{if } t < s; \\ \delta_{s,t} \alpha_s, & \text{otherwise} \end{cases} \qquad \text{for every } (s,t) \in S \times S \right).$$

Every $(s,t) \in S \times S$ which does not satisfy $t \leq s$ must satisfy

$$b_{s,t} = 0 \tag{13.201.12}$$

[1280]. Hence, Lemma 13.199.5 (applied to B and $b_{s,t}$ instead of A and $a_{s,t}$) shows that $B \in \mathrm{T}_S$.

[1278] *Proof.* Let $s \in S$. Then, Lemma 13.199.8 shows that the element $a_{s,s}$ of $\mathbf{k}$ is invertible.

But (13.201.8) yields

$$\begin{aligned} e_s &= \sum_{t \in S} a_{s,t} f_t = \sum_{\substack{t \in S; \\ t \leq s}} a_{s,t} f_t + \sum_{\substack{t \in S; \\ \text{not } t \leq s}} \underbrace{a_{s,t}}_{\substack{=0 \\ \text{(by (13.201.9))}}} f_t \\ &= \sum_{\substack{t \in S; \\ t \leq s}} a_{s,t} f_t + \underbrace{\sum_{\substack{t \in S; \\ \text{not } t \leq s}} 0 f_t}_{=0} = \sum_{\substack{t \in S; \\ t \leq s}} a_{s,t} f_t = a_{s,s} f_s + \underbrace{\sum_{\substack{t \in S; \\ t \leq s \text{ and } t \neq s}}}_{= \sum_{\substack{t \in S; \\ t < s}}} a_{s,t} f_t \\ &\qquad \text{(here, we have split off the addend for } t = s \text{ from the sum)} \\ &= a_{s,s} f_s + \underbrace{\sum_{\substack{t \in S; \\ t < s}} a_{s,t} f_t}_{=(\text{a } \mathbf{k}\text{-linear combination of the elements } f_t \text{ for } t \in S \text{ satisfying } t < s)} \\ &= a_{s,s} f_s + (\text{a } \mathbf{k}\text{-linear combination of the elements } f_t \text{ for } t \in S \text{ satisfying } t < s). \end{aligned}$$

Hence,

$$e_s = \alpha_s f_s + (\text{a } \mathbf{k}\text{-linear combination of the elements } f_t \text{ for } t \in S \text{ satisfying } t < s)$$

for some invertible $\alpha_s \in \mathbf{k}$ (namely, for $\alpha_s = a_{s,s}$). Qed.

[1279] *Proof.* Let $s \in S$. Subtracting $\alpha_s f_s$ from both sides of (13.201.10), we obtain

$$e_s - \alpha_s f_s = (\text{a } \mathbf{k}\text{-linear combination of the elements } f_t \text{ for } t \in S \text{ satisfying } t < s).$$

In other words, there exists a family $(c_{s,t})_{t \in S;\ t < s} \in \mathbf{k}^{\{t \in S \mid t < s\}}$ such that $e_s - \alpha_s f_s = \sum_{\substack{t \in S; \\ t < s}} c_{s,t} f_t$.

[1280] *Proof of (13.201.12):* Let $(s,t) \in S \times S$ be such that we do not have $t \leq s$.

We do not have $t \leq s$. Thus, we do not have $s = t$ (since $s = t$ would imply $t \leq s$). Hence, $\delta_{s,t} = 0$.

On the other hand, every $(s,t) \in S \times S$ which satisfies $t < s$ must satisfy

$$\begin{aligned} b_{s,t} &= \begin{cases} c_{s,t}, & \text{if } t < s; \\ \delta_{s,t}\alpha_s, & \text{otherwise} \end{cases} \qquad \text{(by the definition of } b_{s,t}\text{)} \\ &= c_{s,t} \qquad \text{(since } t < s\text{)}. \end{aligned} \tag{13.201.13}$$

Moreover, every $s \in S$ satisfies

$$\begin{aligned} b_{s,s} &= \begin{cases} c_{s,s}, & \text{if } s < s; \\ \delta_{s,s}\alpha_s, & \text{otherwise} \end{cases} \qquad \text{(by the definition of } b_{s,s}\text{)} \\ &= \underbrace{\delta_{s,s}}_{=1} \alpha_s \qquad \text{(since we do not have } s < s\text{)} \\ &= \alpha_s. \end{aligned} \tag{13.201.14}$$

Now, recall that, for every $s \in S$, the element α_s of $\mathbf{k}$ is invertible. In other words, for every $s \in S$, the element $b_{s,s}$ of $\mathbf{k}$ is invertible (since $b_{s,s} = \alpha_s$ for every $s \in S$). Hence, Lemma 13.199.9 (applied to B and $b_{s,t}$ instead of A and $a_{s,t}$) shows that $B \in \mathrm{IT}_S$. Thus, Lemma 13.199.6 (applied to B instead of A) shows that B is an invertibly triangular $S \times S$-matrix.

Now,

$$\text{every } s \in S \text{ satisfies } e_s = \sum_{t \in S} b_{s,t} f_t \tag{13.201.15}$$

[1281]. In other words, the family $(e_s)_{s \in S}$ expands in the family $(f_s)_{s \in S}$ through the matrix B (since $B = (b_{s,t})_{(s,t) \in S \times S}$). Hence, the family $(e_s)_{s \in S}$ expands invertibly triangularly in the family $(f_s)_{s \in S}$ (since the matrix B is invertibly triangular). This proves Claim B2.

We have now proven Claim B1 and Claim B2. These two claims are mutually converse implications. Combining these two implications, we obtain an equivalence, which is precisely the statement of Remark 11.1.17(b). Thus, Remark 11.1.17(b) is proven.

If we had $t < s$, then we would have $t \leq s$, which would contradict the fact that we do not have $t \leq s$. Hence, we do not have $t < s$. Now, the definition of $b_{s,t}$ yields

$$\begin{aligned} b_{s,t} &= \begin{cases} c_{s,t}, & \text{if } t < s; \\ \delta_{s,t}\alpha_s, & \text{otherwise} \end{cases} = \underbrace{\delta_{s,t}}_{=0} \alpha_s \qquad \text{(since we do not have } t < s\text{)} \\ &= 0. \end{aligned}$$

This proves (13.201.12).

[1281] *Proof of (13.201.15):* Let $s \in S$. Then,

$$\begin{aligned} \sum_{t \in S} b_{s,t} f_t &= \sum_{\substack{t \in S; \\ t \leq s}} b_{s,t} f_t + \sum_{\substack{t \in S; \\ \text{not } t \leq s}} \underbrace{b_{s,t}}_{\substack{=0 \\ \text{(by (13.201.9))}}} f_t = \sum_{\substack{t \in S; \\ t \leq s}} b_{s,t} f_t + \underbrace{\sum_{\substack{t \in S; \\ \text{not } t \leq s}} 0 f_t}_{=0} \\ &= \sum_{\substack{t \in S; \\ t \leq s}} b_{s,t} f_t = \underbrace{b_{s,s}}_{\substack{=\alpha_s \\ \text{(by (13.201.14))}}} f_s + \underbrace{\sum_{\substack{t \in S; \\ t \leq s \text{ and } t \neq s}}}_{= \sum_{\substack{t \in S; \\ t < s}}} b_{s,t} f_t \\ &\qquad \text{(here, we have split off the addend for } t = s \text{ from the sum)} \\ &= \alpha_s f_s + \sum_{\substack{t \in S; \\ t < s}} \underbrace{b_{s,t}}_{\substack{=c_{s,t} \\ \text{(by (13.201.13))}}} f_t \\ &= \alpha_s f_s + \underbrace{\sum_{\substack{t \in S; \\ t < s}} c_{s,t} f_t}_{\substack{=e_s - \alpha_s f_s \\ \text{(by (13.201.11))}}} = \alpha_s f_s + (e_s - \alpha_s f_s) = e_s. \end{aligned}$$

This proves (13.201.15).

(c) The proof of Remark 11.1.17(c) is analogous to our above proof of Remark 11.1.17(b); the main differences are that "invertibly triangular" has to be replaced by "unitriangular", and correspondingly conditions of the form "$a_{s,s}$ is invertible" are replaced by "$a_{s,s} = 1$", and finally every occurrence of "α_s" has to be replaced by "1". We leave the details to the reader. □

Proof of Corollary 11.1.19. The family $(e_s)_{s\in S}$ expands invertibly triangularly in the family $(f_s)_{s\in S}$. In other words, there exists an invertibly triangular $S \times S$-matrix A such that the family $(e_s)_{s\in S}$ expands in the family $(f_s)_{s\in S}$ through the matrix A (by the definition of what it means to "expand invertibly triangularly"). Denote this A by B. Thus, B is an invertibly triangular $S \times S$-matrix such that the family $(e_s)_{s\in S}$ expands in the family $(f_s)_{s\in S}$ through the matrix B.

Proposition 11.1.10(d) says that any invertibly triangular $S \times S$-matrix is invertible, and that its inverse is again invertibly triangular. In other words: If A is any invertibly triangular $S \times S$-matrix, then A is invertible, and its inverse A^{-1} is again invertibly triangular. We can apply this fact to $A = B$ (since B is an invertibly triangular $S \times S$-matrix). Thus, we conclude that B is invertible, and that its inverse B^{-1} is again invertibly triangular.

Since the matrix B is invertible, we can apply Theorem 11.1.14 to S, $(f_s)_{s\in S}$ and B instead of T, $(f_t)_{t\in T}$ and A. Hence, parts (b), (c), (d) and (e) of Corollary 11.1.19 follow immediately from parts (b), (c), (d) and (e) of Theorem 11.1.14 (applied to S, $(f_s)_{s\in S}$ and B instead of T, $(f_t)_{t\in T}$ and A). It remains to prove Corollary 11.1.19(a).

(a) Theorem 11.1.14(a) (applied to S, $(f_s)_{s\in S}$ and B instead of T, $(f_t)_{t\in T}$ and A) shows that the family $(f_s)_{s\in S}$ expands in the family $(e_s)_{s\in S}$ through the matrix B^{-1}. Hence, there exists an invertibly triangular $S \times S$-matrix A such that the family $(f_s)_{s\in S}$ expands in the family $(e_s)_{s\in S}$ through the matrix A (namely, $A = B^{-1}$). In other words, the family $(f_s)_{s\in S}$ expands invertibly triangularly in the family $(e_s)_{s\in S}$ (by the definition of "expands invertibly triangularly"). This proves Corollary 11.1.19(a). As we said, this completes the proof of Corollary 11.1.19. □

Thus, Exercise 11.1.20 is solved.
